Physics of a U.S.-Based Electron Ion-Collider

Friday, 22 September 2017 12:30 (30 minutes)

The 2015 Long Range Plan for Nuclear Science in the US recommends a high-energy, high-luminosity polarized Electron-Ion Collider (EIC) as the highest priority for new facility construction after the completion of FRIC. The project is currently reviewed by the National Academy of Science. The EIC will, for the first time, precisely image gluons in nucleons and nuclei. It will reveal the origin of the nucleon spin and will explore a new quantum chromodynamics (QCD) frontier of ultra-dense gluon fields. This science will be made possible by the EIC's unique capabilities for collisions of polarized electrons with polarized protons, polarized light ions, and heavy nuclei at high luminosity.

In my talk I will give an overview of the physics motivation and program of an EIC with a focus on the opportunities for small- x physics in $e+A$ collisions and how an EIC will affect our understanding of heavy-ion collisions at RHIC and the LHC.

Presenter: ULLRICH, Thomas (Yale University (US))

Session Classification: Future experiments / Outlook
