

Hyperon production in annihilation reactions

Wednesday, 27 September 2017 12:20 (20 minutes)

Strange and charmed hyperons are an ideal tool to study the strong interaction in the transition region between non-perturbative and perturbative QCD regime. In this presentation prospects for antihyperon-hyperon studies in elementary annihilation reactions are reviewed. Special emphasis is put on recent results from BESIII and prospect for the future PANDA experiment at FAIR.
