Towards gauge unified hidden strong dynamics

Fang Ye National Taiwan University

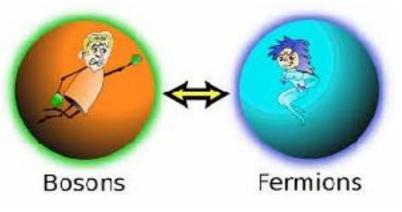

CEPC Workshop

Based on 1607. 05403 [hep-ph] with Cheng-Wei Chiang, and Sichun Sun

A class of models targeting BSM scenarios:

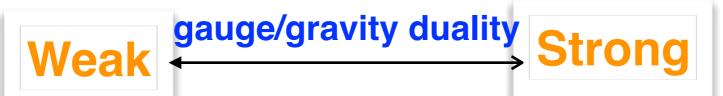

- Extended gauge sector with strong dynamics
- Gauge unification of the visible sector
- SUSY

SUSY: spacetime symmetry that relates fermions and bosons

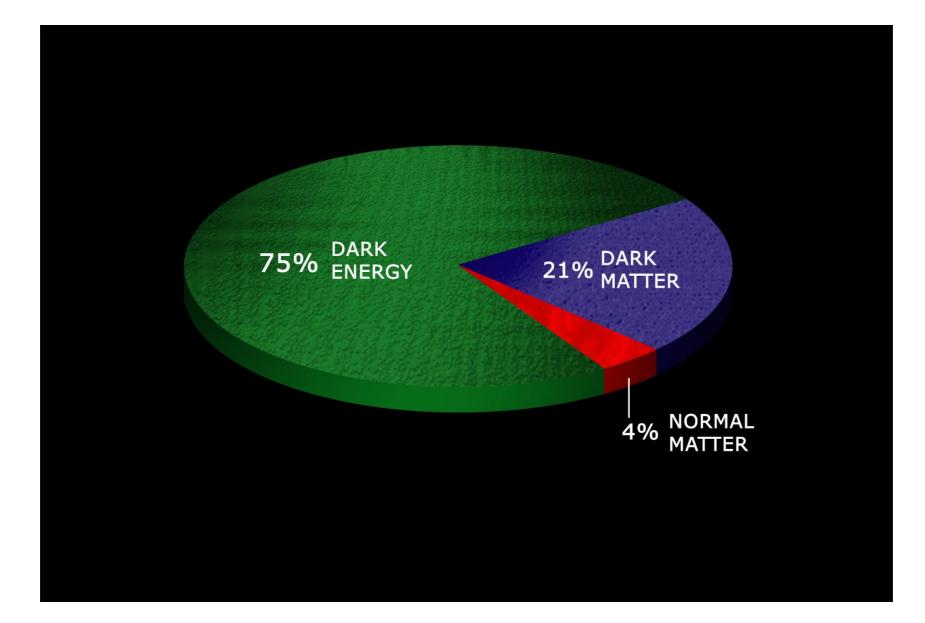

- SUSY has good motivations from both theoretical and phenomenological perspectives.
- Experiment ruled out a large portion of parameter/ model space for low scale SUSY
 SUSY>TeV ?

- Usually low/intermediate scale SUSY: perturbative (except QCD)
- Strongly coupled sectors: generic in fundamental theories
- The study of strongly coupled gauge theory has shed light on the non-perturbative calculations

e.g. Holographic gauge mediation: strongly coupled hidden sector talks to the visible sector via messengers

P. McGuirk, G. Shiu, Y. Sumitomo, Phys. Rev. D81 (2010) 026005 [arXiv:0911.0019[hep-th]].

- **DM**: strong evidence of BSM physics
- Much remains unknown about DM: candidate? elementary or composite?
- How DM interacts? Gravitationally? Nongravitationally?
- DM -> Hidden sector w/ gauge fields, matter fields "Hidden valley scenario"
- If hidden sector w/ strong force -> bound states -> escape experimental bound?

- To propose a type of models s.t.:
- W/ a hidden sector with strong force
- Alleviate naturalness problem in SM
- Its SUSY version w/ significant features different than the usual low scale SUSY
- Possible for GUT
- Various bound states
- W/ DM candidate

• SM+ hidden SU(N) gauge + new (scalar) particles

hidden $SU(N)_H$ gauge group with a confinement scale $\Lambda_H \sim \mathcal{O}(1)$ TeV

AI SM particles are neutral under hidden SU(N)

New (scalar) particles are charged under both hidden SU(N) and SM

Only consider scalars at this stage

Complex scalars

$$\mathcal{L}_{\text{Yukawa}} \supset -Y_U U^{\dagger} H_u Q + \text{c.c.}$$

A supersymmetric version

Take gaugino mediation for example

 $W_{mess1} = Y_s \Phi_S \Phi_\phi \overline{\Phi}_\phi, \quad \Phi_\phi: \text{ a messenger}, \quad \langle F_S \rangle \neq 0,$

There may be other contribution to the scalar potential due to the existence of hidden strong dynamics.

-> possible that messenger scalar eigenvalues smaller than their superpartners Assume this is the case

Those messengers enter into 1-loop corrections to the SM gaugino masses as in the normal gaugino mediation, while the SM gauge bosons remain unaffected due to the gauge symmetries. Thus the mass splittings occur in the SM vector supermultiplets.

Fine-tunings of Higgs mass

SM Higgs: a linear combination of two Higgs doublets with a mass of 125 GeV and vev 246 GeV.

Higgs mass loop correction from MSSM and hidden sector

assume from mass splitting, not considering different SUSY breaking schemes, etc

SM and new particles embedded into a visible SU(5)?
 Assume no intermediate stage of SU(5)_V -> SM

GUT-Higgs mechanism to break SU(5)_V:

< 24 >= diag(2, 2, 2, -3, -3)v.

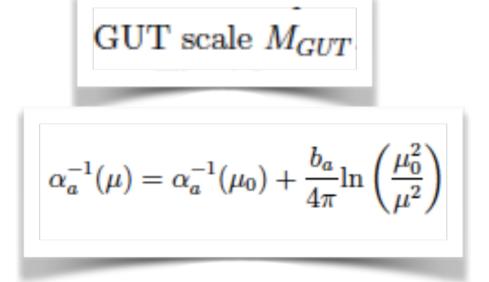

v around GUT scale

SU(5)_V multiplets (e.g. 5, 10) split into SM multiplets

e.g.
$$5 \to (3, 1, -\frac{1}{3}) + (1, 2, \frac{1}{2}),$$

 $\bar{5} \to (\bar{3}, 1, \frac{1}{3}) + (1, 2, -\frac{1}{2}),$

Goal: 1-loop gauge couplings unify at

$$\alpha_3(M_{GUT}) = \alpha_2(M_{GUT}) = \alpha_1(M_{GUT}) \equiv \alpha_{GUT}$$

$$\sin^2 \theta_W(M_{GUT}) = \frac{g_Y^2(M_{GUT})}{g_Y^2(M_{GUT}) + g_2^2(M_{GUT})} = \frac{3}{8}.$$

$$\ln\left(\frac{M_{GUT}}{\mu}\right)^2 = \frac{12\pi}{-8b_3 + 3b_2 + 5b_1} \left[\frac{1}{\alpha_{em}(\mu)} - \frac{8}{3}\frac{1}{\alpha_3(\mu)}\right]$$

Goal: 1-loop gauge couplings unify at

 $\alpha_3(M_{GUT}) = \alpha_2(M_{GUT}) = \alpha_1(M_{GUT}) \equiv \alpha_{GUT}$

GUT remains within the perturbative region, i.e.

 $0 < \alpha_{\text{GUT}}(M_{\text{GUT}}) < 1.$

The GUT scale is not too low or too high. We require the GUT scale is lower than the fundamental string scale M_s (which is lower than the reduced Planck mass M_P). On the other hand, the GUT scale should be high enough not to incur a fast proton decay. Practically speaking, we expect $\mathcal{O}(M_{GUT})$ to be within $\mathcal{O}(10^{15}) \sim \mathcal{O}(10^{16})$ GeV.

 $M_{\rm GUT} > \left(\frac{\alpha_{\rm GUT}}{1/35}\right)^{1/2} \left(\frac{\alpha_N}{0.015 \ {\rm GeV}^3}\right)^{1/2} \left(\frac{A_L}{5}\right)^{1/2} \ 6 \times 10^{15} \ {\rm GeV}$

 $\tau(p \to \pi^0 e^+) > 5.3 \times 10^{33} {
m yr}$

Conditions

on gauge

coupling

unification

1-loop beta function b_i should not be smaller than SM values

GUT scale M_{GUT}

 $b_1 \ge \frac{41}{10}, \ b_2 \ge -\frac{19}{6}, \ b_3 \ge -7$

Gauge coupling unification $10: (Q, U'^{\dagger}, E^{\dagger}),$ SUSY case $10': (U^{\dagger}, ...),$ $\bar{5}: (D^{\dagger}, L)$ $(b_1, b_2, b_3)_{MSSM} = \left(\frac{33}{5}, 1, -3\right)$ unify at $(2-3) \times 10^{16} \text{ GeV}$ Assume SM super partners and new particles all at 1 TeV If add complete SU(5) representations Assume: all new scalars ~ 300 GeV, all new fermions and SM super partners ~ 5 TeV $b_1 = \frac{33}{5} + N(n_5 + 3n_{10} + 3n_{10'})$ $W_{\text{hidden}} \supset \Phi_{\tilde{U}^{\dagger}} Y_U \Phi_{\tilde{Q}} H_u$, at least one $\Phi_{\tilde{O}}$ and one $\Phi_{\tilde{U}^{\dagger}}$ $b_2 = 1 + N(n_5 + 3n_{10} + 3n_{10'})$, $b_3 = -3 + N(n_5 + 3n_{10} + 3n_{10'})$ **Added too many** particles blow up running couplings to low energy hidden "multiplicity"

SU(N)_H

Gauge coupling unification $10: (Q, U'^{\dagger}, E^{\dagger}),$ SUSY case $10': (U^{\dagger}, ...),$ $\bar{5}: (D^{\dagger}, L)$ $(b_1, b_2, b_3)_{MSSM} = \left(\frac{33}{5}, 1, -3\right)$ unify at $(2-3) \times 10^{16} \, \text{GeV}$ Assume SM super partners and new particles all at 1 TeV If add **incomplete** SU(5) representations Assume: all new scalars ~ 300 GeV, all new fermions and SM super partners ~ 5 TeV $W_{\text{hidden}} \supset \Phi_{\tilde{U}^{\dagger}} Y_U \Phi_{\tilde{Q}} H_u$, at least one $\Phi_{\tilde{Q}}$ and one $\Phi_{\tilde{U}^{\dagger}}$ Still can't unify **Added too many** due to Landau pole particles blow up running couplings to low energy

SUSY case

To preserve unification

to have fewer particles at low energies

Split-SUSY?

Only a few SM super partners and new particles remain at low energies; others are at/above GUT scale

Small rank hidden group? Focus on N=2

for the $SU(2)_H$ case the multiplet $\tilde{U'}^{\dagger}$ identifies with the one without tilde,

Agree with 1608.01675 [hep-ph] by Nima et al

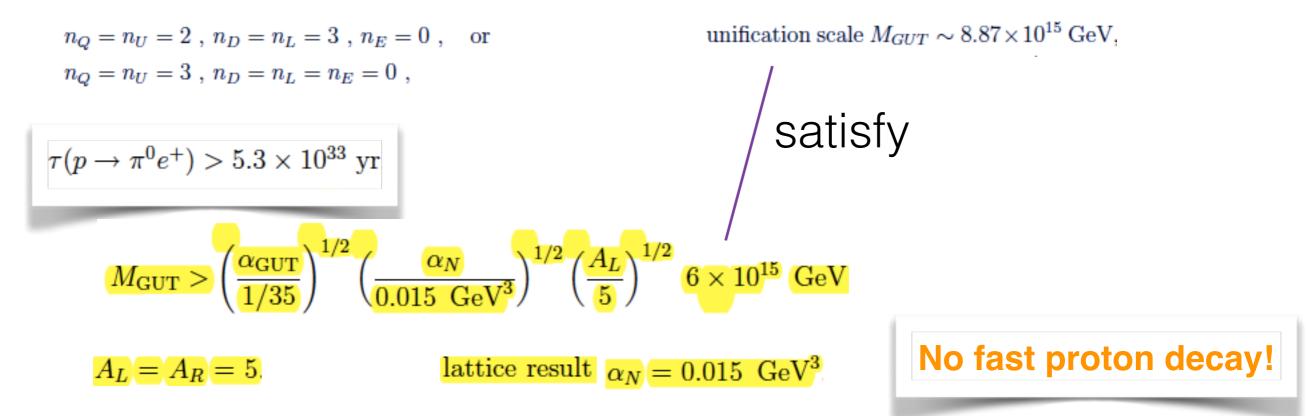

Non-SUSY case

SU(2)_H

Setting: $b_1 = \frac{41}{10} + \frac{1}{20} + \frac{1}{5} \left(\frac{n_Q}{6} + \frac{4n_U}{3} + \frac{n_D}{3} + \frac{n_L}{2} + n_E \right)$ hidden confinement scale ~ 4 TeV, new scalars and the extra Higgs ~ 300 GeV, $b_2 = -\frac{19}{6} + \frac{1}{6} + \frac{n_Q}{2} + \frac{n_L}{6}$ bound states formed by new scalars >= 800 GeV $b_3 = -7 + \frac{n_Q}{2} + \frac{n_U + n_D}{6}$, 0.12 $n_0 = n_U = 2$, $n_D = n_L = 3$, $n_E = 0$ α_3 0.10 Class of sol: $n_Q = n_U = 2$, $n_D = n_L = 3$, $n_E = 0$, or $n_0 = n_U = 3$, $n_D = n_L = n_E = 0$ $n_O = n_U = 3$, $n_D = n_L = n_E = 0$, 0.08 M_{GUT} = 8.87 × 10¹⁵ GeV unification scale $M_{GUT} \sim 8.87 \times 10^{15} \text{ GeV}$, ď 0.06 α_2 0.04 α_1 0.02 6 10 12 8 14 16

Non-SUSY case

SU(2)_H Confining?

 $n_Q = n_U = 2$, $n_D = n_L = 3$, $n_E = 0$, or $n_Q = n_U = 3$, $n_D = n_L = n_E = 0$, unification scale $M_{GUT} \sim 8.87 \times 10^{15} \text{ GeV},$

In the contining phase of SU(2)_H?

Need more details about the hidden sector, e.g. purely hidden particles Find: 1-loop b_2H <0 (asymptotic free in UV), if there are not too many particles only charged under SU(2)_H.

SU(2) $H_{Q} = n_U = 2$, $n_D = n_L = 3$, $n_E = 0$, or $n_Q = n_U = 3$, $n_D = n_L = n_E = 0$,

incomplete SU(5) multiplets added

In 4d field theory context

General strategy: to construct a super potential such that some components of the multiplets get masses around GUT scale and thus decouple from the low energy spectrum. Requiring careful arrangement of VEVS of other fields (in particular singlets); often complicated typical in 4d GUT theories.

 $10: (Q, U'^{\dagger}, E^{\dagger}),$

 $10': (U^{\dagger}, ...),$

 $\bar{5}: (D^{\dagger}, L)$

e.g. doublet-triplet splitting $W_5 = \lambda \, \overline{5} \cdot 24 \cdot 5 + \mu \, \overline{5} \cdot 5$ $\Rightarrow (2\lambda v + \mu) \, \overline{3} \cdot 3 + (-3\lambda v + \mu) \, \overline{2} \cdot 2$

v around GUT scale and doublets at $\mathcal{O}(100)$ GeV.

tuning for mu parameter

Non-SUSY case

SU(2)_H incomplete SU(5) multiplets added

In the context of extra spacial dimensions with orbifold

often in "local GUT" models

Fields localized at the fixed points of internal space survive the orbifold actions and remain as complete multiplets in 4d

Fields living in the bulk are partially projected out and form incomplete multiplets

A GUT multiplet at the fixed point or in the bulk: model-dependent

Assume: underlying mech. to generate mass splitting exists

Bounds from colliders and precision observables

New particles in **bound states**

Different than normal squark/slepton search

 Indirect bounds from EW precision constraints of LEPs (bounds for S, T, W, Y parameters for new scalars are similar to the SUSY bounds) -> lower bound O(100) GeV may be relaxed by decoupling new scalars from SM Higgs

G. Marandella, C. Schappacher and A. Strumia, Nucl. Phys. B 715, 173 (2005) doi:10.1016/j.nuclphysb.2005.03.001 [hep-ph/0502095].

 Indirect bounds from Higgs data: mostly from H -> diphton, H -> gg K. Cheung, J. S. Lee and P. Y. Tseng, Phys. Rev. D 92, no. 9, 095004 (2015) doi:10.1103/PhysRevD.92.095004 [arXiv:1501.03552 [hep-ph]].

Mass of hidden scalars > 300 GeV: safe

Exotic bound states: mesons

Exotic Mesons $\tilde{Q}\tilde{Q}^{\dagger}, \tilde{U}\tilde{U}^{\dagger}, \tilde{D}\tilde{D}^{\dagger}, \tilde{L}\tilde{L}^{\dagger}, \tilde{E}\tilde{E}^{\dagger}$

Table 4: Exotic mesons formed from hidden scalars, all neutral under both SM and hidden gauge groups.

Lightest: CP-even (S-wave bound states of scalars)

SUSY setup: compared to composite/little Higgs, the neutral composite states can be lighter due to mixing with hidden glueballs

Exotic bound states: baryons

SU(2)_H

AA'

Assume a hidden baryon number. Each scalar has hidden baryon number 1/2 (-1/2 for the conjugate).

A and A' denote distinct hidden scalars (or their conjugates) (i.e., $A' \neq A^{\dagger}$).

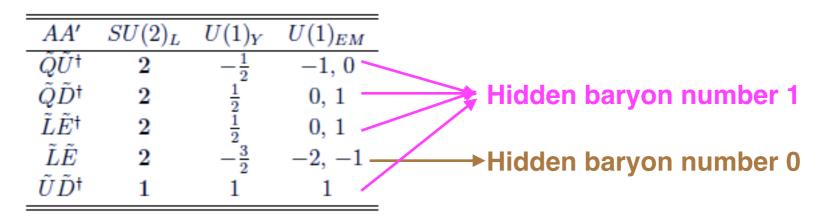

Table 5: Exotic baryons as $SU(2)_L$ doublets and singlets and their Abelian charges. The conjugate particles are not listed.

Baryon masses are not roughly set by the confinement scale like in QCD.

Made by scalars instead of chiral fermions

Exotic bound states: baryons

SU(2)_H Assume a hidden baryon number. Each scalar has hidden baryon number 1/2 (-1/2 for the conjugate).

$\tilde{Q}\tilde{Q}u_{R}$ $A \text{ and } A' \text{ denote distinct hidden scalars (or their conjugates) } (i.e., A' \neq A^{\dagger}).$ a refers to a SM quark. $\tilde{Q}\tilde{Q}u_{R}$ singlet or triplet under $SU(2)_{L}$ hypercharge 1 and electric charge 0, ±1, or ±2.

Stability: QCD binds the hidden singlet AA' and a together

QCD confinement scale ~ O(100) MeV much lower than TeV hidden confinement scale

AA'a type much less stable than AA'

Decay of AA'a: need extra field?

Detailed discussion in follow-up work

Exotic bound states: DM candidates

SU(2)_H

AA'

Assume a hidden baryon number. Each scalar has hidden baryon number 1/2 (-1/2 for the conjugate).

baryons

A and A' denote distinct hidden scalars (or their conjugates) (i.e., $A' \neq A^{\dagger}$).

DM: lightest, electrically neutral, with hidden baryon number 1

DM baryons annihilate into lighter scalar composite states

 $\Omega_B h^2 \sim 10^{-5} \frac{1}{F(M_B)^4} \left(\frac{M_B}{1\,\mathrm{TeV}}\right)^2$

 M_B is the mass of the DM baryon, denoted as B_1

 $F(M_B)$ is the form factor Unitarity limit: F=1

For new scalar ~ 300 GeV, M_B ~ sub-TeV, F not smaller than a certain value, DM will not over close the universe

More exact calculation needs detailed knowledge of hidden strong dynamics, particularly the exact form of form factor

Exotic bound states: DM candidates

SU(2)_H

AA'

Assume a hidden baryon number. Each scalar has hidden baryon number 1/2 (-1/2 for the conjugate).

A and A' denote distinct hidden scalars (or their conjugates) (i.e., $A' \neq A^{\dagger}$).

DM: lightest, electrically neutral, with hidden baryon number 1

Direct search: couplings to SM Higgs
spin-independent cross section

$$\sigma_{SI} = \frac{\lambda_B^2}{4\pi m_h^4} \frac{m_h^4 f_N^2}{M_B^2} \approx 1.36 \times 10^{-44} \text{cm}^2 \times \lambda_B^2 \left(\frac{1 \text{ TeV}}{M_B}\right)^2,$$

$$f_N \approx 0.326 \qquad m_N \text{ is the nucleon mass}$$
can satisfy LUX limit

$$\sigma_{SI} \lesssim 1 \times 10^{-44} \text{cm}^2 (M_B/1 \text{ TeV})$$
for a suitable value of λ_B .
can be w/in reach of proposed LUX-Zeplin
But the unsuppressed Z-boson exchange will violate the LUX limit!
No DM among the lowest baryons in SU(2)_H case.

SU(3) H? \rightarrow Yes, there is DM candidate. e.g. $\tilde{L}_N \tilde{L}_E \tilde{E}^{\dagger}$

- Various hidden scalar contents -> Form various mesons -> Various diboson/diphoton/dijet resonances at different energy scales
- Different than the little Higgs/composite Higgs/ technicolor models: fundamental Higgs, hidden sector not chiral
- For mesons at TeV, their existence may be tested in the near future

Possible other resonance (e.g. Higgs+dijet)?

Effective interactions of a scalar S or a pseudoscalar P with the SM gauge bosons

 $\begin{array}{l} \textbf{messenger scalar} \\ \textbf{formed meson} \end{array} \mathcal{L}_{eff}^{S} = \frac{\kappa_{3}^{(S)}}{\Lambda_{H}} SG_{\mu\nu}^{a}G^{a\,\mu\nu} + \frac{\kappa_{2}^{(S)}}{\Lambda_{H}} SW_{\mu\nu}^{i}W^{i\mu\nu} + \frac{5}{3}\frac{\kappa_{Y}^{(S)}}{\Lambda_{H}} SB_{\mu\nu}B^{\mu\nu} \end{array}$

$$\mathcal{L}_{\text{eff}}^{P} = \frac{\kappa_{3}^{(P)}}{\Lambda_{H}} P \tilde{G}_{\mu\nu}^{a} G^{a\,\mu\nu} + \frac{\kappa_{2}^{(P)}}{\Lambda_{H}} P \tilde{W}_{\mu\nu}^{i} W^{i\,\mu\nu} + \frac{5}{3} \frac{\kappa_{Y}^{(P)}}{\Lambda_{H}} P \tilde{B}_{\mu\nu} B^{\mu\nu}$$

 $\frac{1}{\Lambda_i} = \underbrace{\kappa_i^{(S/P)}}_{\Lambda_H}, \quad i = Y, 2, 3. \text{ characterizing details of strong dynamics}$

Narrow width approximation

Gluon fusion production
Iarge gluon PDF for 13-TeV pp collisions

$$\sigma(p+p\to S/P) = \frac{\pi^2}{8} \left(\frac{\Gamma(S/P\to g+g)}{M_{S/P}} \right) \times \left[\frac{1}{s} \frac{\partial \mathcal{L}_{gg}}{\partial \tau} \right] \qquad \qquad \frac{1}{s} \frac{\partial \mathcal{L}_{gg}}{\partial \tau} \simeq \begin{cases} 0.97 \times 10^3 \text{ pb (for } \sqrt{s} = 8 \text{ TeV)}, \\ 4.4 \times 10^3 \text{ pb (for } \sqrt{s} = 13 \text{ TeV}) \end{cases}$$

 $M_S \simeq 750 \text{ TeV}$ renormalization scale at $\mu = M_S/2$

Focus on CP-even case

$$\begin{split} \Gamma(S \to g + g) &= \frac{2}{\pi} \left(\frac{g_s^2}{\Lambda_3} \right)^2 M_S^3 \;, \\ \Gamma(S \to W^+ + W^-) &= \frac{1}{2} \frac{1}{\pi} \left(\frac{g^2}{\Lambda_2} \right)^2 M_S^3 \;, \\ \Gamma(S \to Z + Z) &= \frac{1}{4} \frac{1}{\pi} \left[\left(\frac{g^2}{\Lambda_2} \right) c_W^2 + \frac{5}{3} \left(\frac{g'^2}{\Lambda_1} \right) s_W^2 \right]^2 M_S^3 \;, \\ \Gamma(S \to \gamma + \gamma) &= \frac{1}{4} \frac{1}{\pi} \left[\left(\frac{g^2}{\Lambda_2} \right) s_W^2 + \frac{5}{3} \left(\frac{g'^2}{\Lambda_1} \right) c_W^2 \right]^2 M_S^3 \;, \\ \Gamma(S \to Z + \gamma) &= \frac{1}{2} \frac{1}{\pi} \left[\left(\frac{g^2}{\Lambda_2} \right) - \frac{5}{3} \left(\frac{g'^2}{\Lambda_1} \right) \right]^2 c_W^2 s_W^2 M_S^3 \;, \end{split}$$

W, Z masses neglected

Coupling to Higgs

$$\mathcal{L} = \left(\lambda_Q \, \tilde{Q}^{\dagger} \tilde{Q} + \lambda_U \, \tilde{U}^{\dagger} \tilde{U}\right) H^{\dagger} H$$

reparameterize $\lambda_{Q,D}$ and θ by λ .
$$\mathcal{L} = \frac{\lambda}{4\pi} \Lambda_H S H^{\dagger} H$$

$$\Gamma(S \to H + H^{\dagger}) = \frac{1}{8\pi M_S} \left(\frac{\lambda \Lambda_{\rm dyn}}{4\pi}\right)^2$$

SU(2)_H example

Assume

$$\begin{split} n_Q &= n_U = 2 \ , \ n_D = n_L = 3 \ , \ n_E = 0 \ , \quad \text{or} \\ n_Q &= n_U = 3 \ , \ n_D = n_L = n_E = 0 \ , \end{split}$$

Both Q

 and U
 representations are respectively degenerate, i.e.,

 $m_{\tilde{Q}_1} = m_{\tilde{Q}_2} = \dots \;, \quad m_{\tilde{U}_1} = m_{\tilde{U}_2} = \dots \;,$

where the lower indices of \tilde{Q} and \tilde{U} refer to different generations.

• Both \tilde{Q} and \tilde{U} have similar masses, and are lighter than the other scalars,

 $m_{\tilde{Q}} \approx m_{\tilde{U}} < \mbox{ mass of any other hidden scalars.}$

follows 1 examples with gauge coupling unification

▶
$$n_Q = n_U = 2$$
, $n_D = n_L = 3$, $n_E = 0$, or
 $n_Q = n_U = 3$, $n_D = n_L = n_E = 0$,

We haven't specified the mechanism to generate the hidden scalar masses

Diboson/Diphoton/Dijet Resonance

meson mass eigenstates S and T

 $\begin{pmatrix} S \\ T \end{pmatrix} = \frac{4\pi}{\kappa \Lambda_H} \begin{pmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{pmatrix} \begin{pmatrix} \tilde{Q}^{\dagger}\tilde{Q} \\ \tilde{U}^{\dagger}\tilde{U} \end{pmatrix}$

 $\kappa \sim \mathcal{O}(1)$

 $n_Q = n_U = 2$, $n_D = n_L = 3$, $n_E = 0$, or

1

 $n_O = n_U = 3$, $n_D = n_L = n_E = 0$,

$$\mathcal{L}_{eff} \ni \frac{\kappa}{4\pi\Lambda_H} \Big[(2\cos\theta + \sin\theta)SG^2 + 3\cos\theta SW^2 + (\frac{1}{3}\cos\theta + \frac{8}{3}\sin\theta)SB^2 \Big] + \dots, \qquad \text{suppression scales} \qquad \qquad \frac{1}{\Lambda_3} = \frac{\kappa(2\cos\theta + \sin\theta)}{4\pi\Lambda_H} , \\ \frac{1}{\Lambda_2} = \frac{3\kappa\cos\theta}{4\pi\Lambda_H} , \\ \frac{1}{\Lambda_Y} = \frac{3}{5}\frac{\kappa}{4\pi\Lambda_H} \left(\frac{1}{3}\cos\theta + \frac{8}{3}\sin\theta\right)$$

Diboson/Diphoton/Dijet Resonance $n_{O} = n_{U} = 2, n_{D} = n_{L} = 3, n_{E} = 0$,

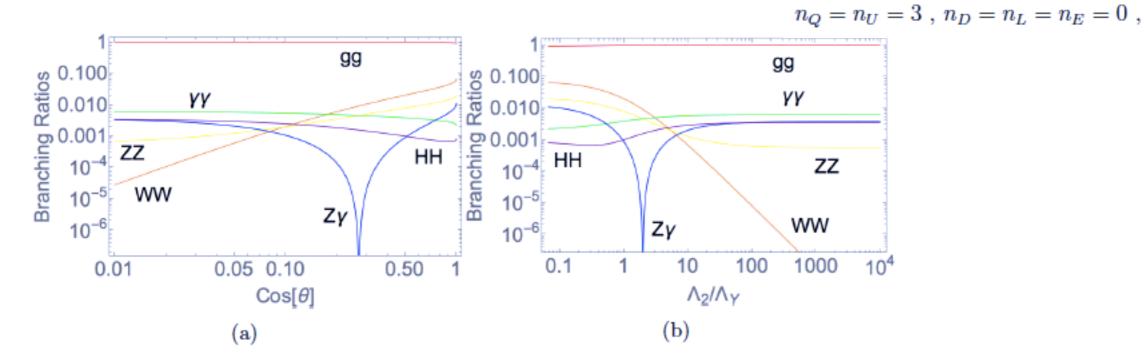

Figure 5: Branching ratios of the scalar resonance decaying into the gauge boson pairs and the Higgs boson pair as functions of $\cos \theta$ [plot (a)] and Λ_2/Λ_Y [plot (b)] for $M_S = 750$ GeV, and $\Lambda_H = 4$ TeV. (a) and (b) are depicted for $\lambda = 0.01$.

$$\mathcal{L} = \frac{\lambda}{4\pi} \Lambda_H S H^{\dagger} H \; .$$

or

Large gluon-fusion production

$$(S \to H + H^{\dagger}) = \frac{1}{8\pi M_S} \left(\frac{\lambda \Lambda_{\rm dyn}}{4\pi}\right)^2$$

assuming $\lambda \to 0$ in the following

Resonance is purely constructed by colored scalars

- We propose a type of models consisting of SM and a strongly coupled hidden gauge sector.
- W/ new matter fields charged under SM and hidden groups, SM gauge couplings can be unified at a reasonable scale w/o fast proton decay. -> Potential GUT
- Alleviate the EW hierarchy problem w/ or w/o SUSY.
- Higgses as fundamental particles whose EW breaking pattern largely remains intact at low energies -> different than little/composite/-Higgs/techni-color, suffering less from constraints
- Predict exotic bound states -> a wide range of spectrum, some maybe w/in detector search, some maybe DM (w/ various weak charges and spins), some maybe diboson/diphoton/dijet resonance

Possible other resonance (e.g. Higgs+dijet)?

• May exist an underling theory, e.g. string theory

Thank you!

Split SUSY

N. Arkani-Hamed and S. Dimopoulos, arXiv:hep-th/0405159.

SM + Higgsinos + gluinos, winos, bino

All the scalars of the supersymmetric SM except a finely tuned Higgs become ultra heavy.

Fermions can remain light, protected by (approx) chiral symmetry, and account for gauge coupling unification

Can solve: absence of many particles, dim-5 proton decay, SUSY flavor and CP problems, cosmological graviton and moduli problems

SUSY breaking and mediation

- SUSY: impose relations between dimensionless couplings to cancel Higgs mass quadratic divergence
- Soft SUSY breaking (w/o introducing quadratic divergence): SUSY relations btw dimensionless couplings must hold; soft terms only contain $\mathcal{L} = \mathcal{L}_{SUSY} + \mathcal{L}_{soft}$ couplings with positive mass dimension

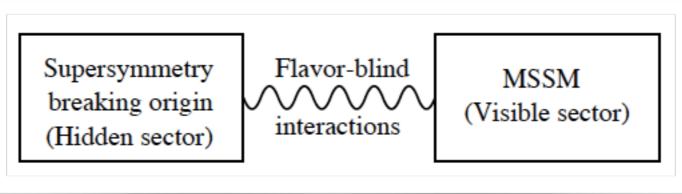

Soft terms vanish in limit: soft mass ->0 $\mathcal{L}_{\text{soft}} = -\left(\frac{1}{2}\underline{M_a \lambda^a \lambda^a} + \frac{1}{6}a^{ijk}\phi_i\phi_j\phi_k + \frac{1}{2}b^{ij}\phi_i\phi_j + t^i\phi_i\right) + \text{c.c.} - (m^2)^i_j\phi^{j*}\phi_i,$ gaugino m_{soft} largest mass scale in soft terms $\mathcal{L}_{\text{maybe soft}} = -\frac{1}{2} c_i^{jk} \phi^{*i} \phi_j \phi_k + \text{c.c.}$

Soft mass terms for chiral multiplet fermion: from superpotential and

Soft parameters cannot be arbitrary either

SUSY breaking and mediation

- Spontaneous SUSY breaking: via non-vanishing F- and/ or D-term(s)
- MSSM: a D-term VEV for U(1)_Y not leading to acceptable spectrum; no gauge singlet whose F-term with a VEV -> Need a separate SUSY breakdown sector

SUSY broken by F-term in hidden sector mediated by ordinary weak

Mediation: gravity, gauge, etc
 MSSM soft terms from messenger loops

Dim-analysis: soft mass vanishing when F-term VEV -> 0, and also when the messenger mass -> infinity (decoupled) $\longrightarrow m_{soft} \sim \frac{\alpha}{4\pi} \frac{\langle F \rangle}{M_{messager}}$

Gauge coupling unification

1-loop running couplings $\alpha_a = \frac{g_a^2}{4\pi}$ $\alpha_a^{-1}(\mu) = \alpha_a^{-1}(\mu_0) + \frac{b_a}{4\pi} \ln\left(\frac{\mu_0^2}{\mu^2}\right)$

field contents participating

$$b_{a} = -\frac{11}{3} \sum_{V} C(R_{V}^{a}) + \frac{2}{3} \sum_{W eyl} C(R_{F}^{a}) + \frac{1}{6} \sum_{Real} C(R_{S}^{a}),$$

Dynkin indices

$$Tr \left(T_{R}^{A} T_{R}^{B}\right) = C(R) \delta^{AB}$$

$$C(N) = \frac{1}{2}.$$

$$C(a) = N, \quad C(A_{2}) = \frac{N-2}{2}, \quad C(S_{2}) = \frac{N+2}{2},$$

Abelian group $C(R_V^a) \to 0$, $C(R_F^a) \to \frac{3}{5}Y_F^2$ and $C(R_S^a) \to \frac{3}{5}Y_S^2$,

EW precision constraints of LEPs

 SUSY affects the "universal" EW precision parameters S, T, W, Y

Heavy universal approx: new physics above weak scale (heavy), couples dominantly to vector bosons (universal)

Table 1: The first column defines the adimensional form factors. The second column defines the $SU(2)_L$ invariant universal dimension-6 operators, which contribute to the form-factors on the same row. We use non canonically normalized fields and Π , see eq. (3). The \hat{S} , \hat{T} , \hat{U} are related to the usual S, T, Uparameters [5] as: $S = 4s_W^2 \hat{S}/\alpha \approx 119 \hat{S}$, $T = \hat{T}/\alpha \approx 129 \hat{T}$, $U = -4s_W^2 \hat{U}/\alpha$. The last row defines one additional form-factor in the QCD sector.
