YAJEM

a MC code for in-medium shower evolution

Thorsten Renk

HELSINKI INSTITUTE OF PHYSICS

THE MODEL

- Guiding principles
- Model details

LEADING HADRON RESULTS

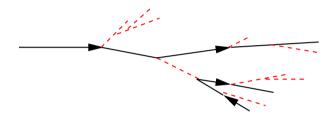

- Energy loss and brick problem
- Nuclear suppression factor R_{AA} Jets results
- Thrust, n-jet fraction and jet shapes
- Trigger bias

SUMMARY

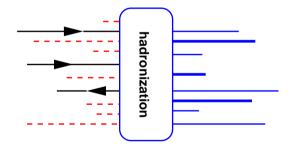

THE FRAGMENTATION FUNCTION

 $D_{f\to h}^{vac}(z,\mu_f^2)$ encodes the following physics:

ullet radiation from the highly virtual initial parton via q o qg, g o gg and $g o q\overline{q}$ (perturbatively calculable for $Q \simeq 1$ GeV)

hadronization (non-perturbative)

- ullet virtual parton formation time $au \sim E/Q^2$, hadron formation time $au_h \sim E_h/m_h^2$
- ightarrow part of the shower evolution for RHIC kinematics happens in the medium
- ightarrow light hadrons or high P_T hadrons are produced outside the medium
- ⇒ the medium predominantly affects the perturbative parton shower

Medium-modified parton shower

YaJEM (Yet another Jet Energy-loss Model) — a in-medium shower evolution code

Guiding principles

- exact energy-momentum conservation, easy contact with experimental data analysis
- ⇒ Monte Carlo (MC) realization of shower evolution
- known and well-tested p-p baseline
- → based on PYSHOW from the PYTHIA package, uses Lund model hadronization
- \rightarrow issues with low P_T heavy hadrons, as they hadronize in medium
- minimal prior assumptions about the medium degrees of freedom (ideal fluid picture — may not be thermal quasiparticles or perturbative DOF)
- → various phenomenological parton-medium interaction scenarios
- to be used together with a 3-d hydrodynamical medium description
- → issues with unrealistic situations (infinite medium, density increase . . .)
- ullet to be constrained by all high P_T RHIC observables before LHC predictions

JET EVOLUTION IN POSITION SPACE

Jet evolution equations ⇔ momentum space Medium description ⇔ position space

ullet model average time for a parton b to branch from parent a as

$$\langle \tau_b \rangle = \frac{E_b}{Q_b^2} - \frac{E_b}{Q_a^2}$$

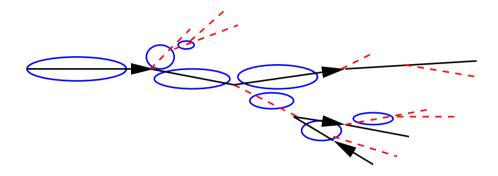

• actual branching time in given event from probability distribution

$$P(\tau_b) = \exp\left[-\frac{\tau_b}{\langle \tau_b \rangle}\right]$$

- assume all partons are on eikonal trajectory determined by the shower initiator
- ⇒ position of all branchings in spacetime known and connected with medium model

MEDIUM-MODIFIED BRANCHING

• change parton kinematics during propagation

* multiple soft scattering leads to medium-induced virtuality (RAD)

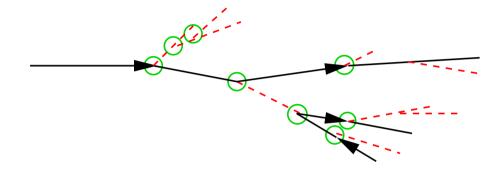

$$\Delta Q_a^2 = \int_{\tau_a^0}^{\tau_a^0 + \tau_a} d\zeta \hat{q}(\zeta)$$

* in a strongly coupled medium, a drag force appears (DRAG)

$$\Delta E_a = \int_{\tau_a^0}^{\tau_a^0 + \tau_a} d\zeta D\rho(\zeta)$$

Medium-modified branching

change splitting probability in Kernel

* enchance singular part of splitting kernel by $(1 + f_{med})$ (FMED), e.g.

$$P_{q \to qg}(z) = \frac{41 + z^2}{31 - z} \Rightarrow \frac{4}{3} \left(\frac{2(1 + f_{med})}{1 - z} - (1 + z) \right)$$

 \Rightarrow assume $f_{med} \sim \int d\zeta \rho(\zeta)$ to link with spacetime evolution

N. Borghini and U. A. Wiedemann, hep-ph/0506218; K. Zapp, G. Ingelman, J. Rathsman, J. Stachel and U. A. Wiedemann, 0804.3568 [hep-ph].

HYDRO AVERAGING

• hard vertices for impact parameter **b** have probability distribution

$$P(x_0, y_0) = \frac{T_A(\mathbf{r_0} + \mathbf{b/2})T_A(\mathbf{r_0} - \mathbf{b/2})}{T_{AA}(\mathbf{b})},$$

where $T_A(\mathbf{r}) = \int dz \rho_A(\mathbf{r}, z)$.

• if the medium-modified fragmentation function along a given path (determined by medium, vertex $\mathbf{r_0} = (x_0, y_0)$, rapidity y and transverse angle ϕ is $D_{i \to h}^{med}(z, \mu | \mathbf{r_0}, y, \phi)$ we can define:

$$\langle D_{i\to h}^{med}(z,\mu)\rangle_{T_{AA}} = \frac{1}{2\pi} \int_0^{2\pi} d\phi \int_{-\infty}^{\infty} dx_0 \int_{-\infty}^{\infty} dy_0 P(x_0,y_0) D_{i\to h}^{med}(z,\mu|\mathbf{r_0},y,\phi).$$

For R_{AA} , this corresponds to a computationally rather intensive averaging of paths in a evolving hydrodynamical model with a weight given by $P(x_0, y_0)$. For back-to-back hadron correlations, the averaging is even more complicated due to the trigger bias.

⇒ Thanks to Helen Caines and her group for access to the Yale **bulldogk** cluster!

ENERGY LOSS

Comparison with analytical energy loss models is not straightforward:

- \bullet vacuum baseline is *not* a single parton with energy E_0 but a shower
- \rightarrow leading shower parton has probabilistic $E < E_0$ compute ΔE relative to what?
- leading parton identity may change and cannot be tagged
- \rightarrow 7 GeV gluon radiation from 10 GeV quark is 7 GeV energy loss in ASW but 3 GeV energy loss and parton identity change in YaJEM

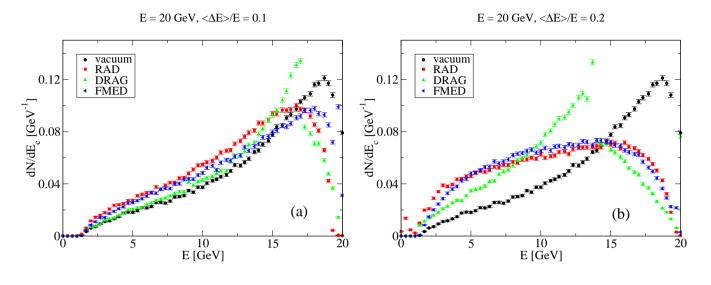

Solution:

- c-quark as shower initiator: * hard fragmentation * identity preserved
- extract energy loss with an ansatz

$$\frac{dN^{med}}{dE_c}(E) = \int d(\Delta E) \frac{dN^{vac}}{dE_c}(E') P(\Delta E) \delta(E' - E - \Delta E)$$

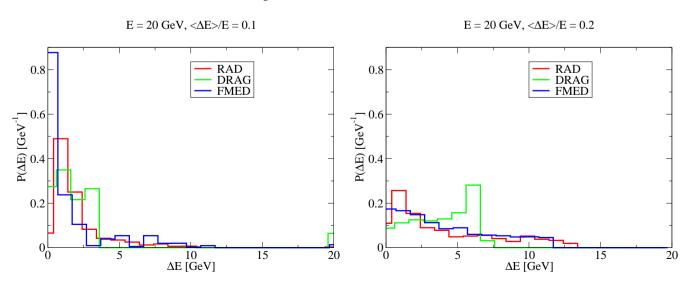

- \rightarrow this assumes $P(\Delta E, E) = P(\Delta E)$ (not usually in YaJEM) and allows $\Delta E > E$
- \Rightarrow extraction of energy loss not reliable for large $\Delta E!$

Energy loss

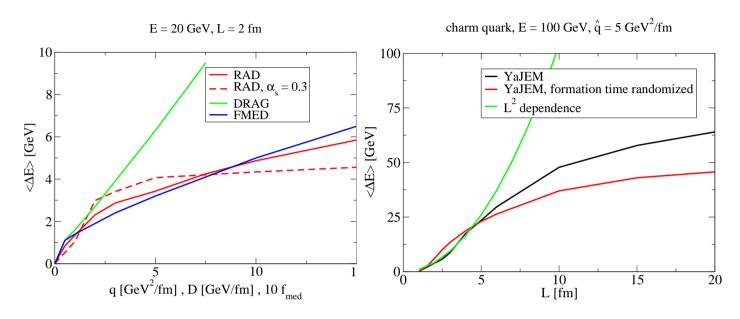

Solve matrix equation for P_j subject to $P_j > 0$ and $\sum_j P_j = 1$

$$N_i(E^i) = \sum_{j=1}^n K_{ij}(E^i, \Delta E^j) P_j(\Delta E^j)$$

ENERGY LOSS

Parametric dependence:

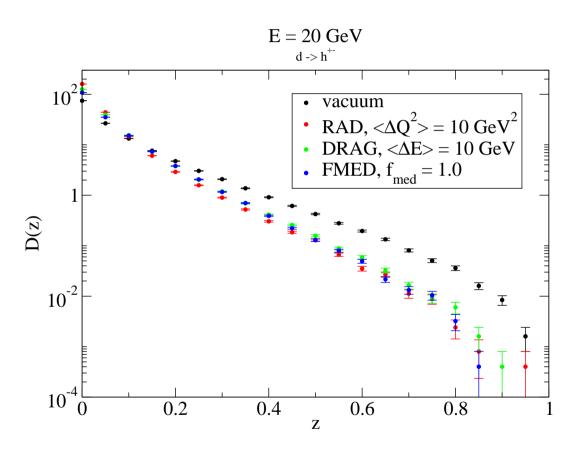

- L const. increased medium effect
- → saturation of energy loss in radiative scenarios, much weaker for drag
- \hat{q} const., L increased (or: is the LPM effect visible?)
- ightarrow if formation time not randomized: initial L^2 dependence, then finite energy limit
- ightarrow if formation time randomized: L^2 dependence almost invisible

Reason for L^2 dependence: coherent summation of medium effect during gluon formation time in RAD scenario

Modified shower comparison (I)

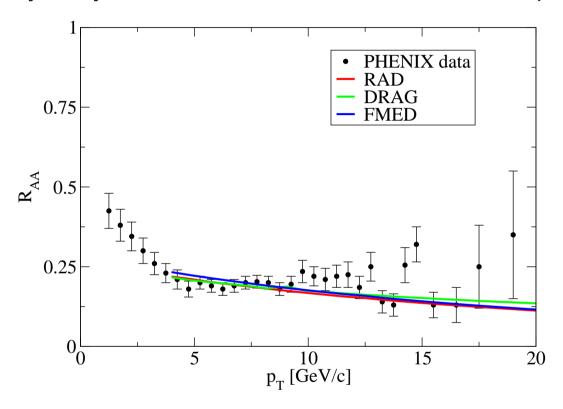

Single path from center of hydro medium: Fragmentation function

- ullet medium-modified FF: depletion at high z
- parameters can be adjusted such that all scenarios look similar

Modified shower comparison (II)

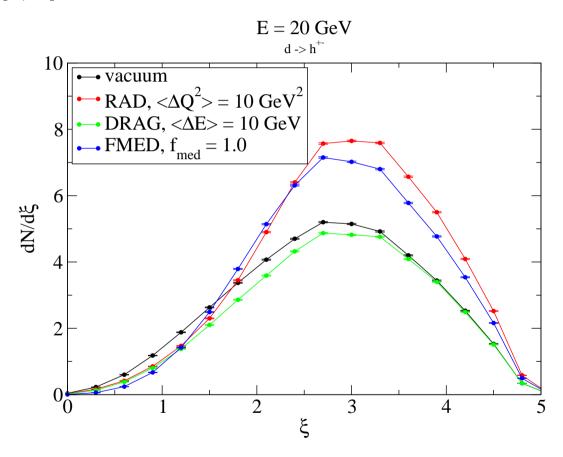

Averaged over 3-d hydrodynamical medium evolution, R_{AA} comparison is possible:

- results practically indistinguishable
- puzzling decrease with P_T
- also seen in other calculations of in-medium shower evolution, not an artefact

Modified shower comparison (III)

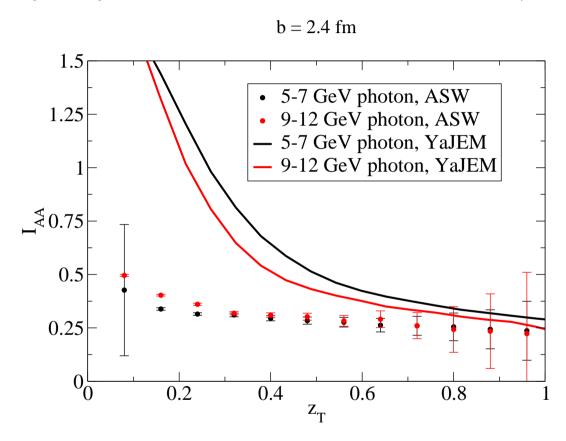

Single path from center of hydro medium: Looking at $\xi = \ln[1/z]$ magnifies low z particle production:

- medium-induced radiation as in RAD or FMED enhance the hump-backed plateau
- a drag force in which energy is transferred to the medium does not

Modified shower comparison (IV)

Averaged over 3-d hydrodynamical medium evolution, I_{AA} in γ -h:

- assumtion: lost energy in ASW nonperturbatively distributed in medium
- perturbative low z hadron production in shower should be visible $\Rightarrow I_{AA} > 1$ not seen in either preliminary STAR or PHENIX data

TOWARDS JET OBSERVABLES

Problem 1: Cannot distinguish medium and jet at low P_T :

Any low P_T hadron correlated with the jet axis may be correlated because. . .

- it is part of the hadronization of the perturbative shower
- it is bulk medium recoiling from the jet-medium interaction
- it is, due to a similar bias, accidentially correlated
 (e.g. unmodified jets tend to emerge ⊥ surface direction of radial flow!)

Problem 2: The hadronization models may not be valid at low P_T (in the medium)

- ullet at present we can only compute reliably above a P_T cut
- ⇒ need to worry about bias (excluding events with lots of soft production)

LHC jet expectations are proof of principle! Real predictions will require knowledge of experimental jet finding strategy — lots of issues hidden in the small print!

JET OBSERVABLES AT LHC (I)

Thrust distribution for typical medium path:

$$T = \max_{\mathbf{n_T}} \frac{\sum_i |\mathbf{p_i} \cdot \mathbf{n_T}|}{\sum_i |\mathbf{p_i}|} \quad T_{maj} = \max_{\mathbf{n_T} \cdot \mathbf{n} = 0} \frac{\sum_i |\mathbf{p_i} \cdot \mathbf{n}|}{\sum_i |\mathbf{p_i}|} \quad T_{min} = \frac{\sum_i |\mathbf{p_i} \cdot \mathbf{n_{mi}}|}{\sum_i |\mathbf{p_i}|}$$

$$100 \text{ GeV quark} \quad 100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100 \text{ GeV quark}, \mathbf{P_T} > 4 \text{ GeV}$$

$$100$$

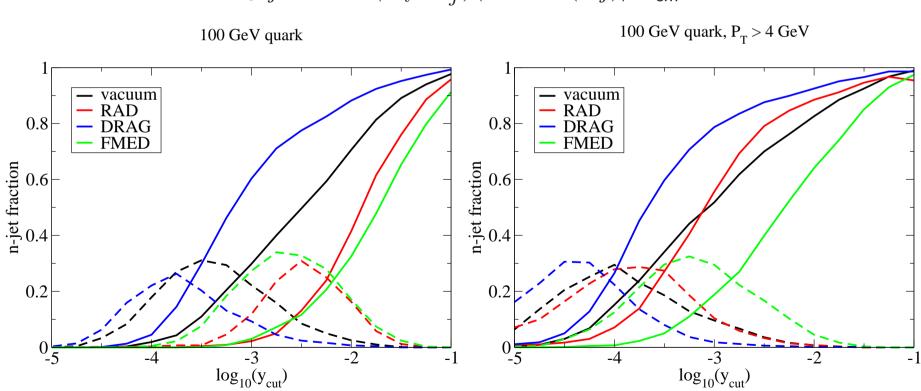

- induced radiation tends to make the event more spherical
- ullet difference between RAD and FMED for P_T cut

JET OBSERVABLES AT LHC (II)

2 and 4-jet fraction for typical in-medium path for a back-to-back pair:

Clustering with a resolution scale y_{min} based on distance measure

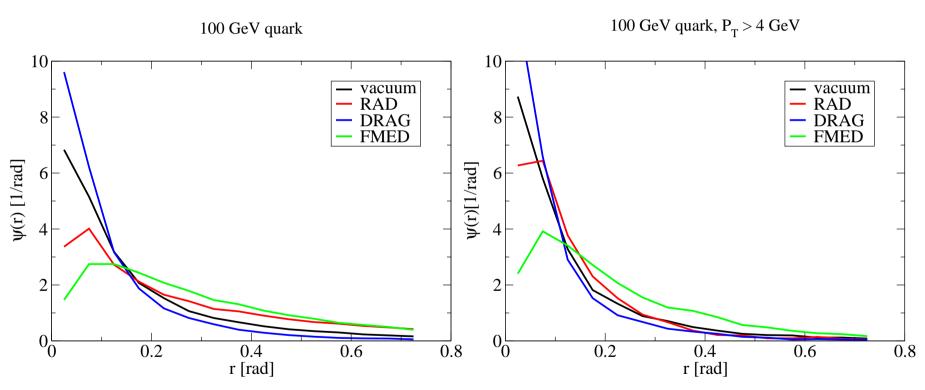

$$y_{ij} = 2\min(E_i^2, E_j^2)(1 - \cos(\theta_{ij})/E_{cm}^2)$$

Jet observables at LHC (III)

Jet shapes for typical medium path:

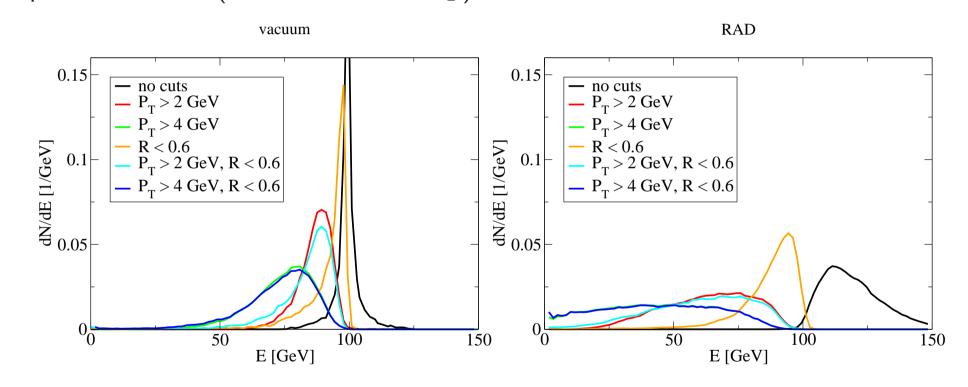

$$\Psi_{int}(r,R) = \frac{\sum_{i} E_{i}\theta(r-R_{i})}{\sum_{i} E_{i}\theta(R-R_{i})}$$

T. R., 0906.3397 [hep-ph]

JET OBSERVABLES AT LHC — TRIGGER BIAS

Given a 100 GeV quark shower initiator — what is the energy detected within typical experimental cuts (cone radius R or P_T)?

medium-modified jets are unlikely to be found with correct energy

T. R., 0906.3397 [hep-ph]

YAJEM — CURRENT STATUS

Theoretical

- TECHQM brick problem: Done!
- → https://wiki.bnl.gov/TECHQM/index.php/YaJEM, 0901.2818 [hep-ph] (with several caveats — difficult problem in YaJEM language)
- comparison with JEWEL results on thrust, n-jet fraction, $dN/d\xi$: Done!
- \rightarrow 0901.2818 [hep-ph], 0906.3397 [hep-ph] (qualitatively similar)
- LPM effect and L^2 energy loss pathlength dependence for constant medium: Done!
- → can reproduce limit, however other effects dominate.
- comparison with BDMPS or AMY limits: Not done.
- → no infinite medium limit, no infinite parton energy limit, no on-shell limit

YAJEM — CURRENT STATUS

Phenomenology

- hydro-averaged comparison with R_{AA} : Done!
- \rightarrow puzzling decrease of $R_{AA}(P_T)$, also seen in other models: Unexplained. . .
- hydro-averaged comparison with $R_{AA}(\phi)$: Not done.
- hydro-averaged comparison with I_{AA} in γ -h: Done!
- \rightarrow not in agreement with preliminary data at low z: Unexplained. . .
- hydro-averaged comparison with I_{AA} in h-h: Almost done!
- \rightarrow agreement with data questionable (pathlength dependence) Unexplained. . .
- hydro-averaged comparison with single $e^ R_{AA}$: Done!
- \rightarrow results comparable with other radiative energy loss models: Unexplained. . .

Too many open issues to predict comfortably. . .

YAJEM — CURRENT STATUS

The simpler ASW energy loss ansatz with static scattering centers and infinite parton energy actually works much better for all these observables!

As a theorist, I am somewhat dismayed by the fact that trying to make the model more realistic leads to less agreement with the data. As a phenomenologist however, I am excited by the fact that there's something to learn here!

My (cautious) impression is that there is part of the parton-medium dynamics which is not perturbative jet evolution, and that the medium may not have perturbatively resolvable degrees of freedom. If so, arguing theoretically from agreement with pQCD limits which model is more valid may be just a red herring.
