Karlsruhe Institute of Technology (KIT), ¹Institute for Experimental Particle Physics (ETP), ²Institute for Program Structures and Data Organization (IPD)

Motivation

- Flat computing budget model does not cover future needs for computing resources
- Most efficient usage is mandatory

<https://arxiv.org/abs/1712.06982>

- Computing resources for user jobs in HEP will be increasingly distributed and heterogeneous
 - Addition of cloud resources like HNSciCloud and AWS
 - Institute clusters and Tier 3 centers
- Different job types and mixtures optimal for each resource
- Data placement will be more dynamic
 - Fewer centers hosting data
 - Leads to increase remote access

Scheduling as a key component

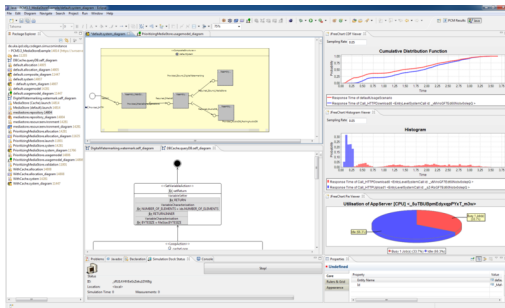

- Already for the current resources efficient scheduling for jobs is a challenge
- Even more important for distributed heterogeneous resources in the future
- Need to find ways to simulate the usage efficiency of these resources with different scheduling approaches

- Simulate these resources using different scheduling approaches
 - Need to model workflows and resources
 - Need to implement different scheduling approaches
 - Check the effect of these approaches on the usage efficiency
- Make use of the **Palladio Simulator**^[1]
 - Established tool in the computer science community
 - Actively developed and used by computer scientists at KIT
 - Extended to model jobs and available resources at computing centers
- As a proof of concept simulate CMS workflows at the Tier 1 center GridKa

[1] The Palladio component model for model-driven performance prediction
<https://doi.org/10.1016/j.jss.2008.03.066>

- Performance predictions for design decisions
- Software architecture simulator
- Successfully applied for
 - Solving industrial problems
 - Optimizing cloud infrastructure (chemical computing)^[1]

Graphical Interface of the Palladio Eclipse Plugin

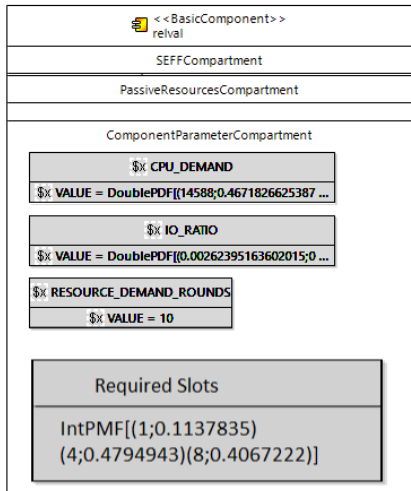

- Abstract models: Express resource needs as statistical distributions

[1] Rapid Testing of IaaS Resource Management Algorithms via Cloud Middleware Simulation
<https://arxiv.org/pdf/1801.09484.pdf>

Model Computing Jobs

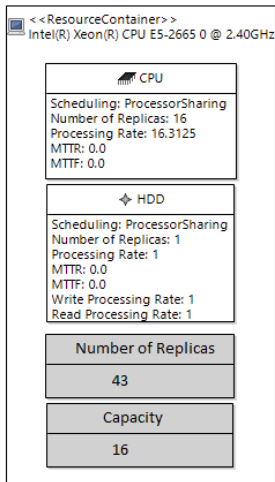

- Model each kind of computing job with its resource usage
 - CPU & I/O
 - Required job slots
 - Number of events

- Model high load on system
 - Closed workload
 - Enough jobs to guarantee that system never idles
 - Each job type has configurable share of load

Screenshot: Computing job component in Palladio

- Model each type of computing node
 - Number and processing speed of cores
 - I/O capabilities
 - Number of instances of node
- Model load balancing strategy
 - First fit search based on available job slots
 - Easily modifiable to evaluate new strategies

Data Sources:

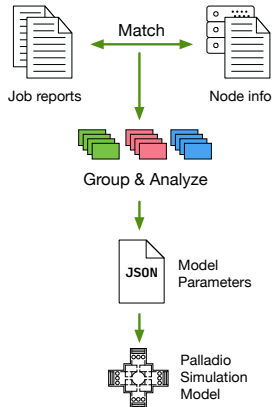

- Global job monitoring data
 - JobMonitoring, WMArchive job reports
from Hadoop analytix cluster with CMSSpark framework (Kuznetsov)
 - Currently extracting CMS jobs at GridKa
- Site-specific performance data
 - VO resource share
 - Node benchmarks

Realistic job CPU usage profiles
(including failing jobs)

Automated parameter extraction:

1. **Match** jobs and node performance information
2. **Group** computing jobs by type and requirements
3. **Extract** resource demand distributions and load composition

- Simulation of CMS computing jobs at GridKa for one week
 - Ran in 18 minutes on a laptop
- Metrics
 - Throughput
 - Share of job types
 - CPU efficiency

- Computing resources for user analyses will become **increasingly distributed and heterogeneous** in the future
- Scheduling will be a key component for the **efficient usage**
- In cooperation with computer scientists at KIT use the tool Palladio to **model and evaluate different scheduling strategies**
- A **proof of concept** for the usage of Palladio was performed simulating CMS workflows at the Tier 1 center GridKa
 - Fully automated model creation based on data from CMS workflow monitoring and GridKa
 - We were able to successfully model the situation at GridKa for key metrics
 - Investigate modeling for further metrics

- Extend the current model to be able to simulate heterogeneous and distributed computing resources
- Include modeling of challenges due to remote data access and caching mechanism
- Use the result of these models as an input for the design of future scheduling systems
- Optimize scheduling decisions using modeling results at run-time
