Future Accelerators at the High Energy Frontier

Professor Emmanuel Tsesmelis

Accelerator Physics Graduate Course

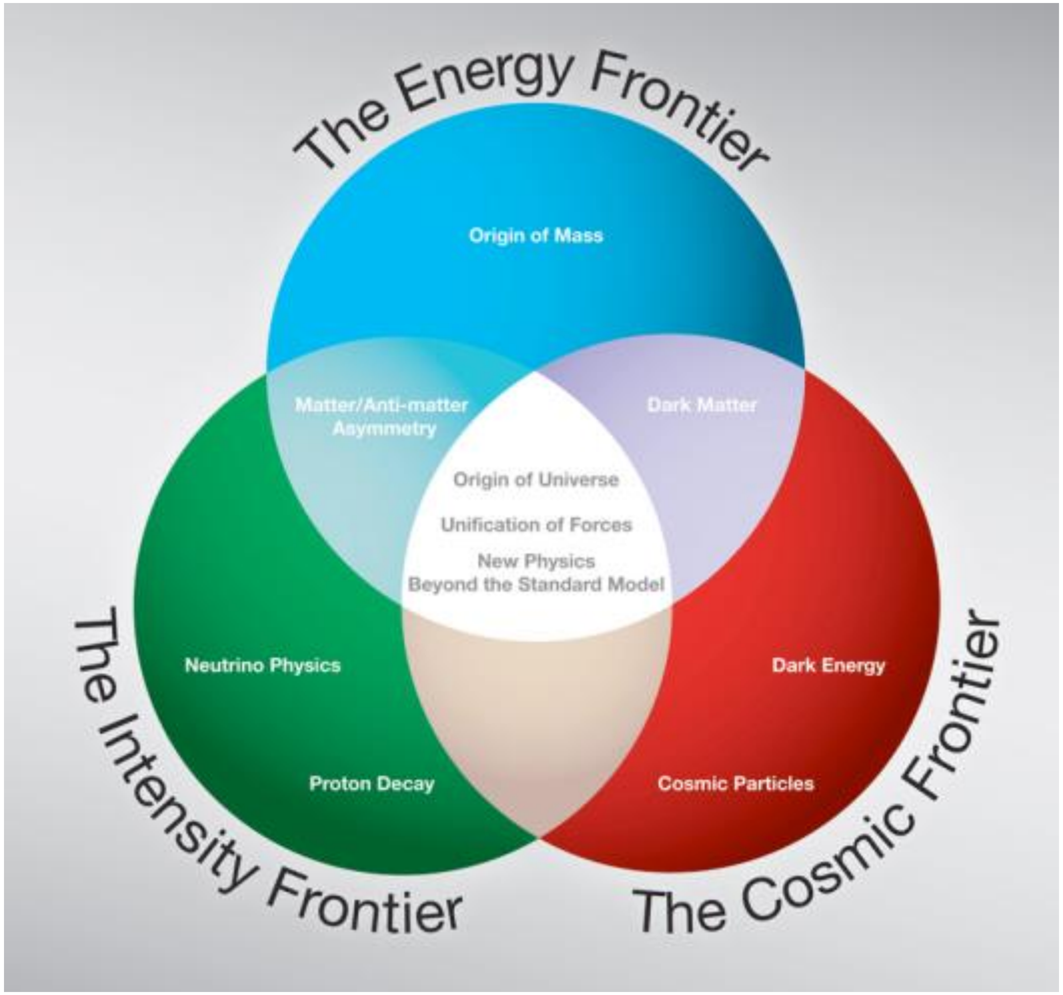
John Adams Institute for Accelerator Science

15 February 2017

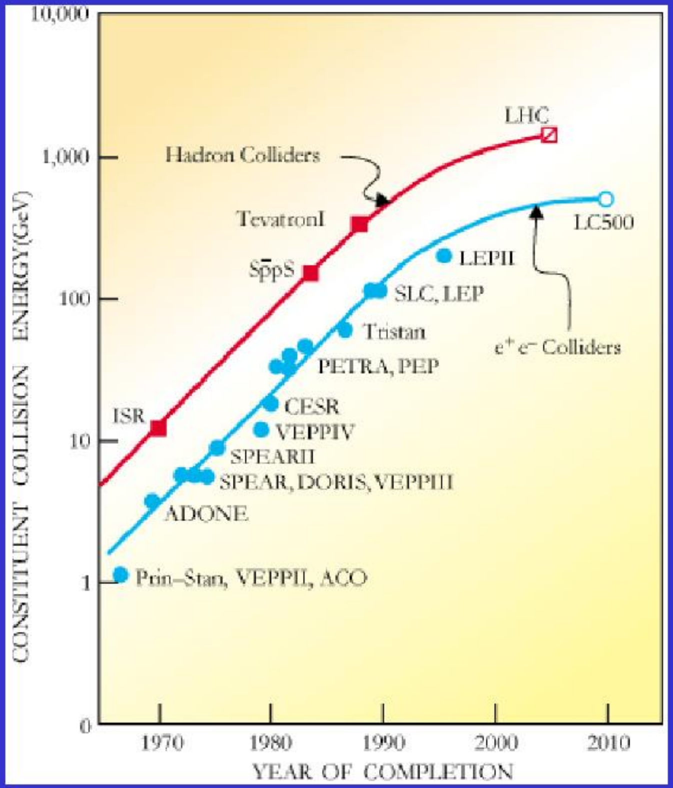
Aims of Lecture

- Present overview of various future collider projects, including beam parameters.
- Compare potential science goals & reach at each future collider.
- Characterize required R&D to be carried out prior to construction.
- Juxtapose possible timelines of each project.

The Three Frontiers



Colliders – Energy vs. Time



M. Tigner: "Does Accelerator-Based Particle Physics have a Future?" Physics Today, Jan 2001 Vol 54, Nb 1

The Livingston plot shows a saturation effect!

Practical limit for accelerators at the energy frontier:

Project cost increases as the energy must increase!

Cost per GeV C.M. proton has decreased by factor 10 over last 40 years (not corrected for inflation)!

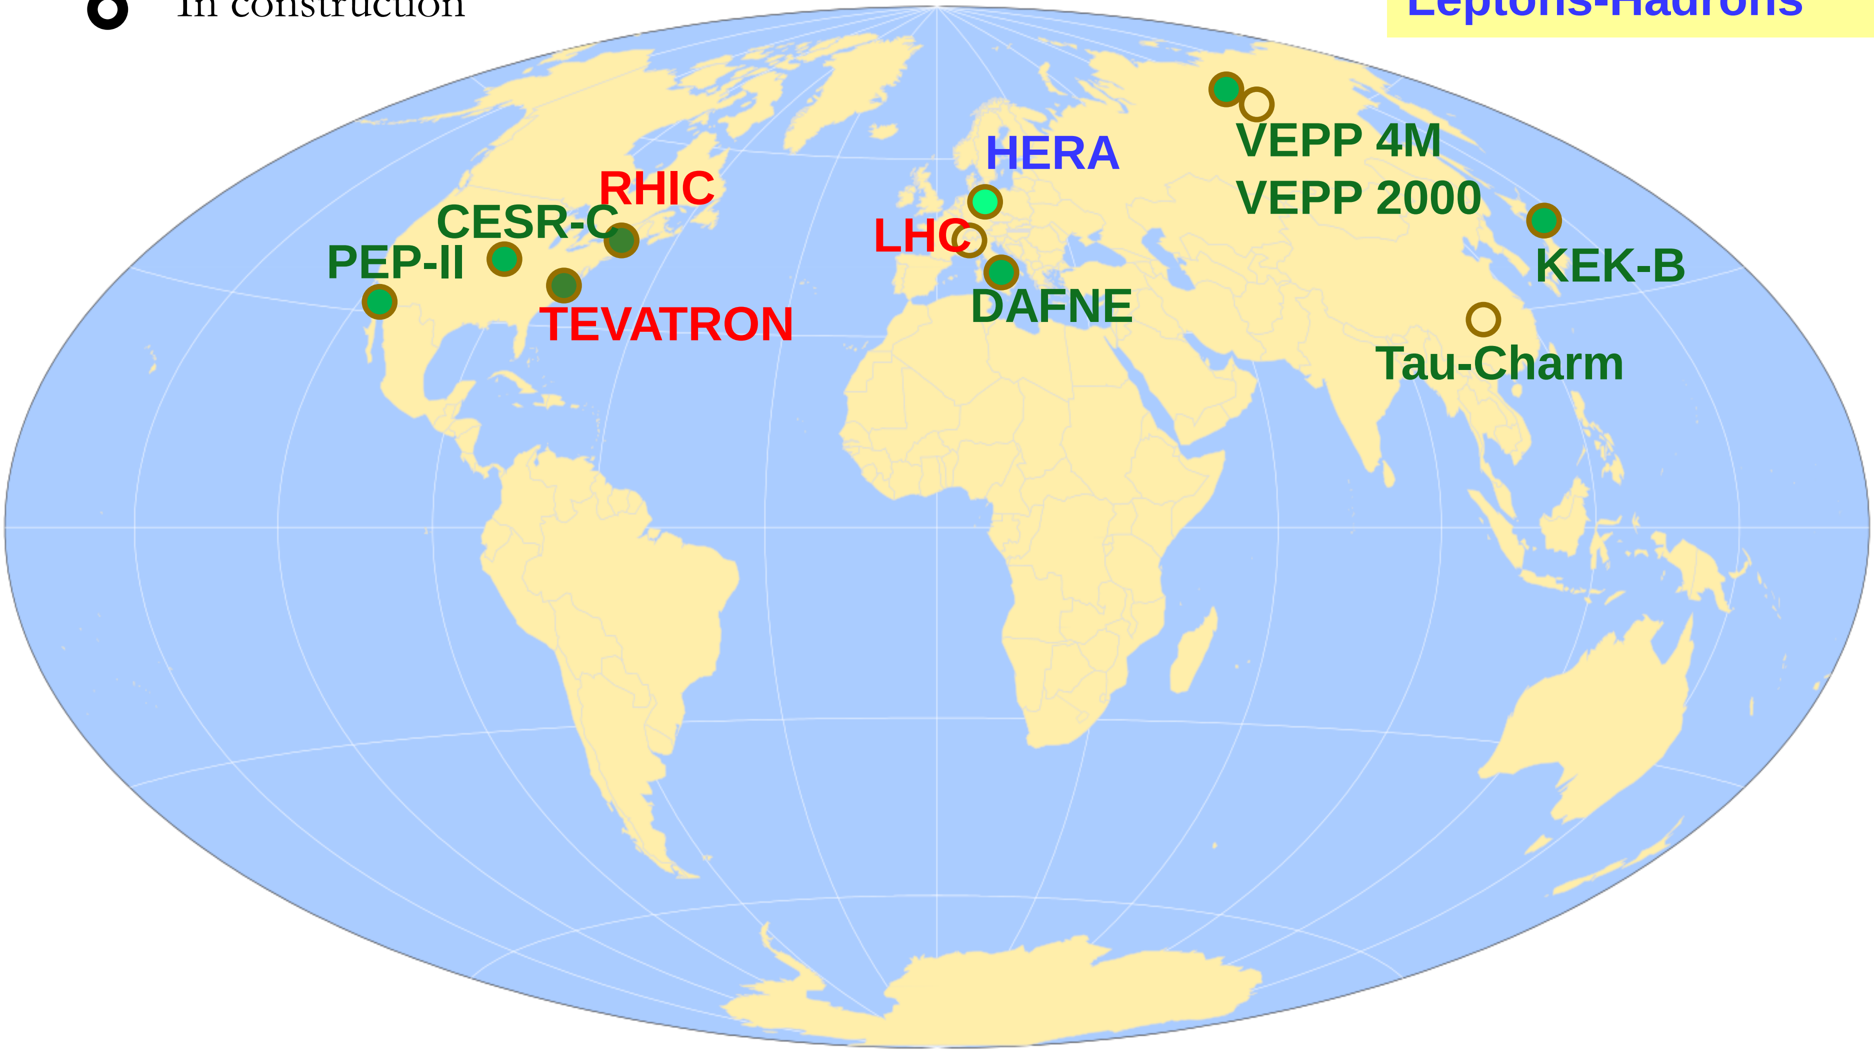
Not enough: Project cost increased by factor 200!

New technology needed…

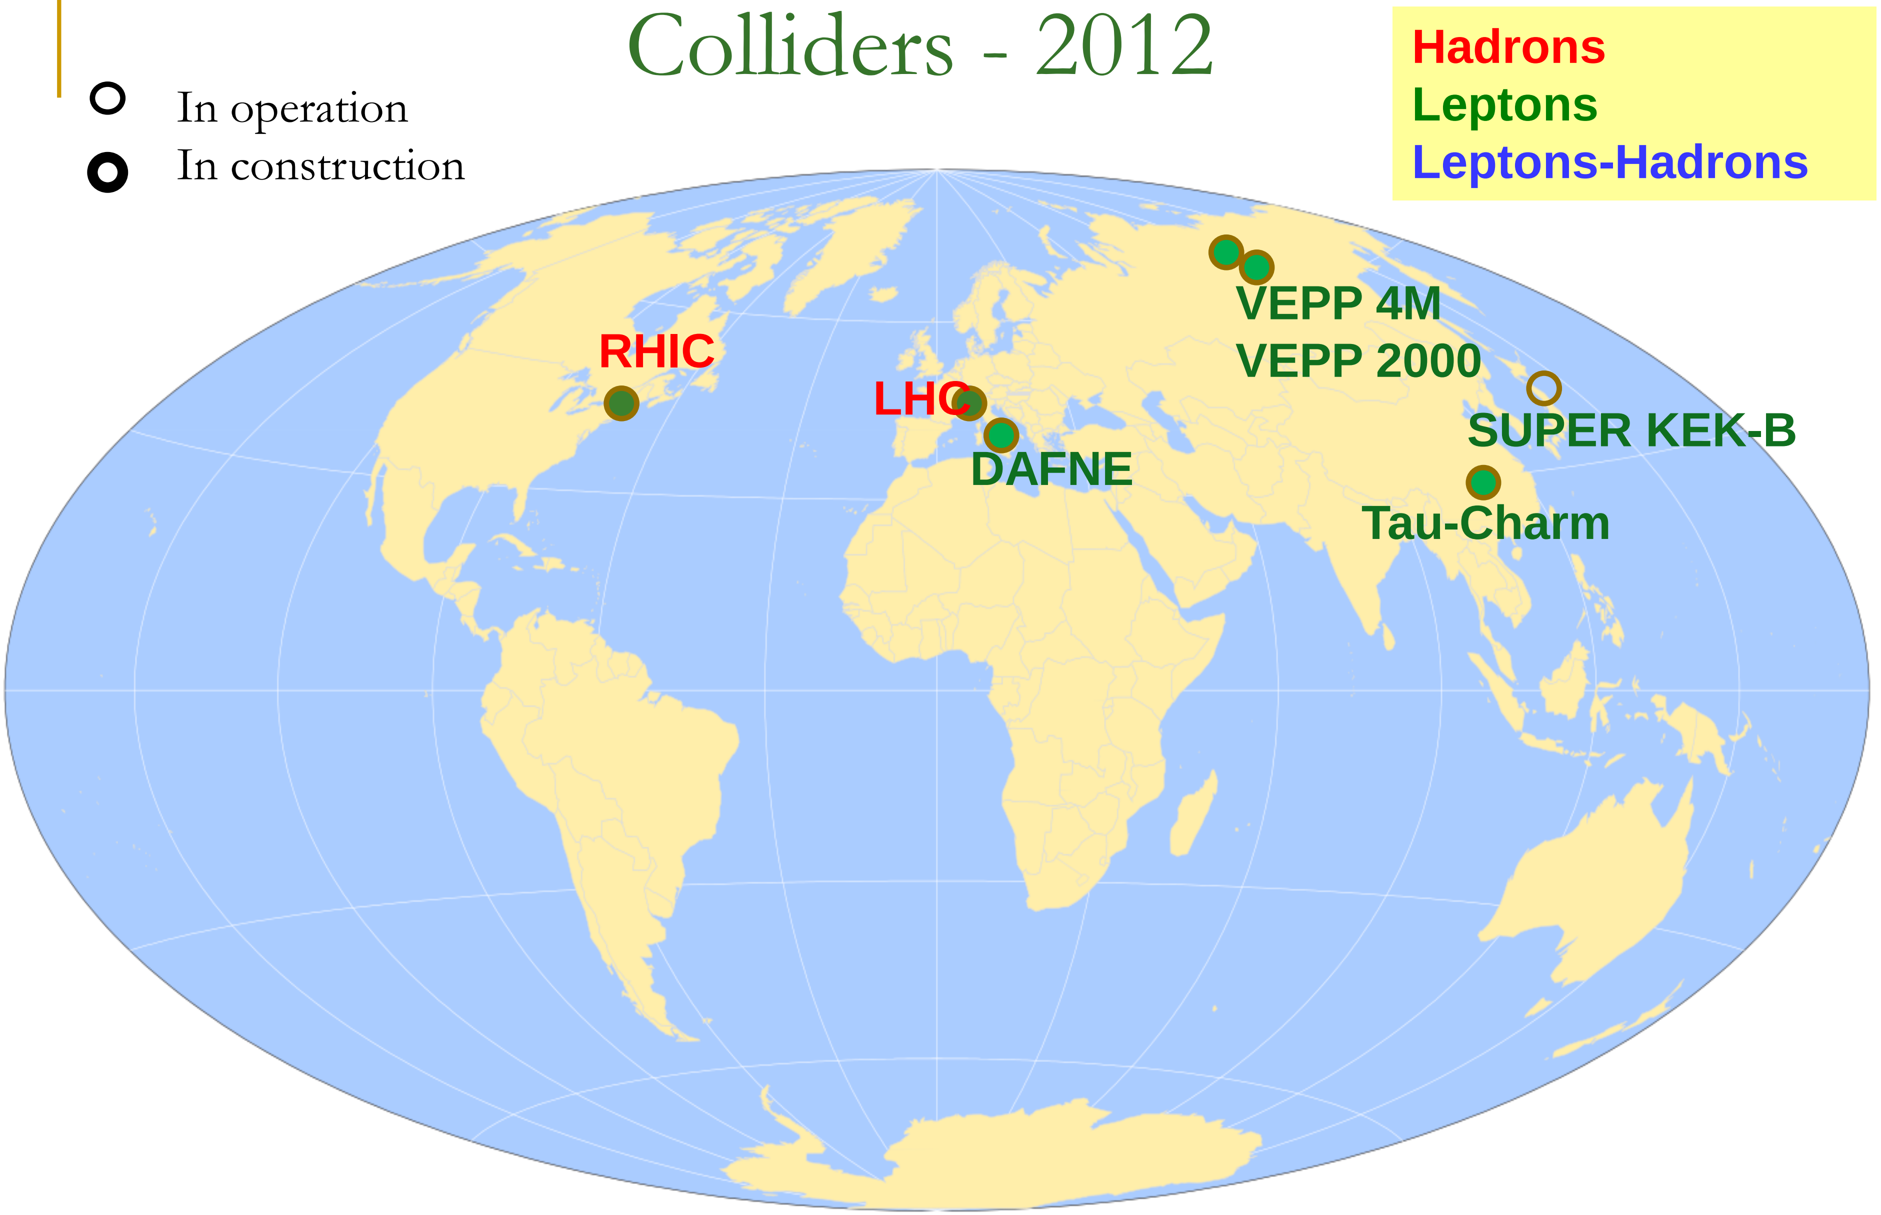
Colliders - 2006

- In operation
- In construction

Hadrons
Leptons
Leptons-Hadrons

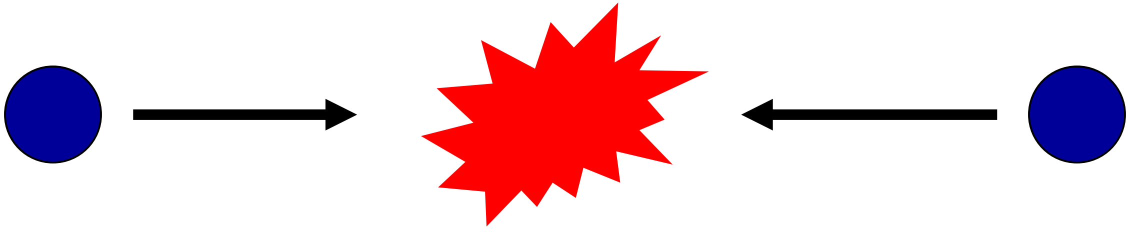


Colliders - 2012



Why Build Colliders?

- **Want to see constituents of matter .**
- **Smash matter together and look for the building blocks.**
- **Take small pieces of matter:**
  - **accelerate them to very high energy**
  - **crash them into one another**



$E = mc^2 = \gamma m_0 c^2$

Higher energy produces more massive particles.

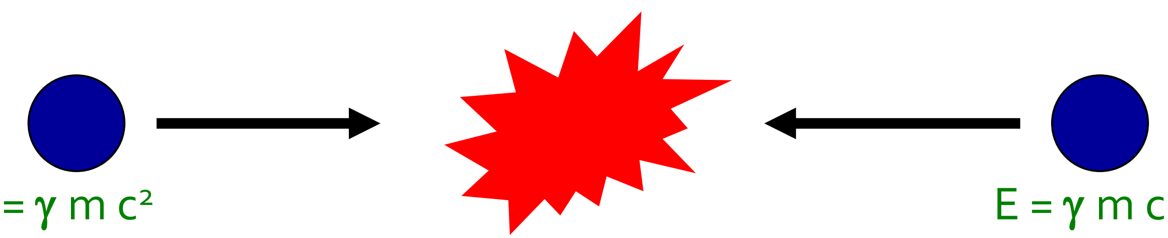
When particles approach speed of light, they get more massive but not faster.

Why Colliders?

$E = \gamma m c^2$

$P = \gamma m v$

Only a tiny fraction of energy converted into mass of new particles (due to energy and <u>momentum</u> conservation)



$E = \gamma m c^2$ $\quad$ $E = \gamma m c^2$

Entire energy converted into the mass of new particles

Scientific Challenge:

to understand the very first moments of our Universe after the Big Bang

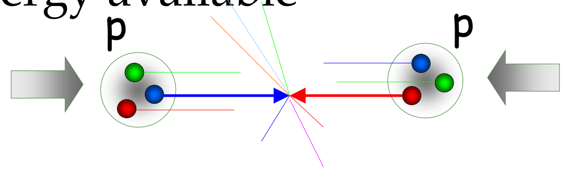
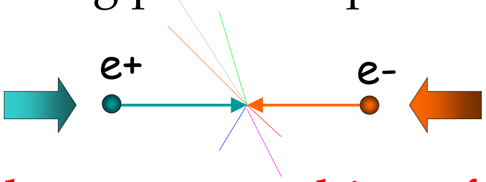
Collider Characteristics

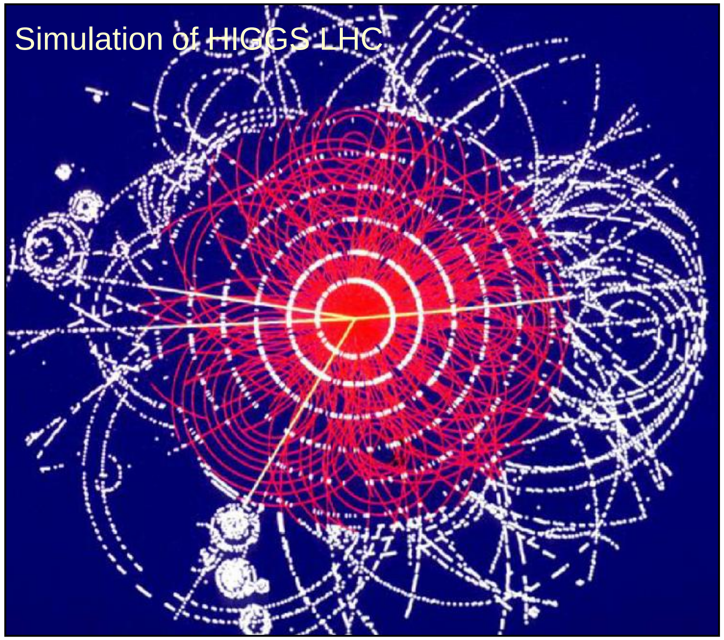
- Hadron collider at the frontier of physics
  - huge QCD background
  - not all nucleon energy available in collision

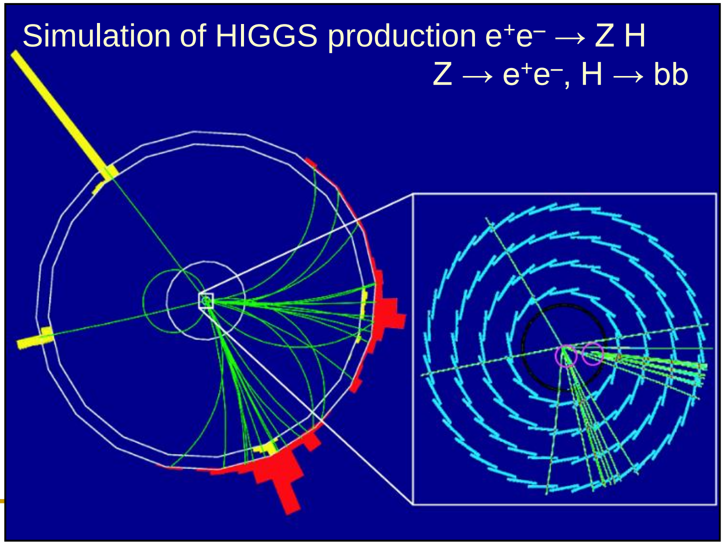


- Lepton collider for precision physics
  - well defined initial energy for reaction
  - Colliding point like particles

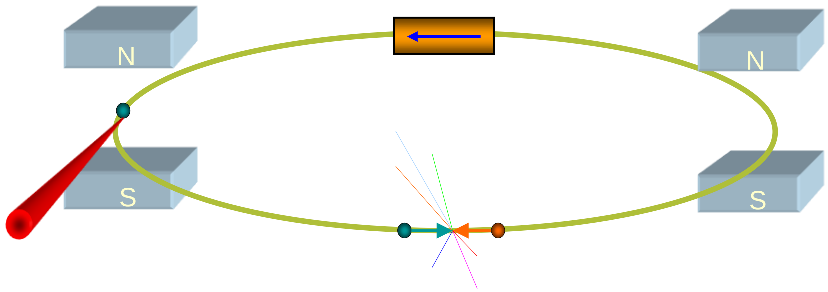


- Candidate next machine after LHC
  - e^+e^- collider
  - energy determined by LHC discoveries
  - study in detail the properties of the new physics that the LHC finds





Circular versus Linear Collider

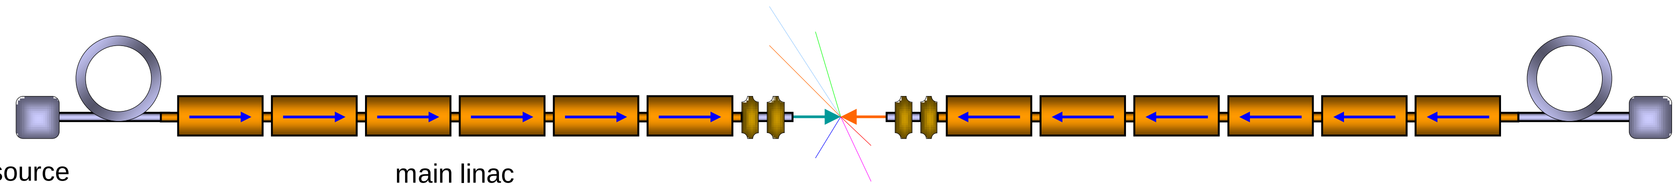


Circular Collider

many magnets, few cavities, stored beam

higher energy → stronger magnetic field

→ higher synchrotron radiation losses (E^4/m^4R)



Linear Collider

few magnets, many cavities, single pass beam

higher energy → higher accelerating gradient

higher luminosity → higher beam power (high bunch repetition)

Today's Accelerators

- Hadron Colliders
  - Protons are composite particles
    - Only ~10% of beam energy available for hard collisions producing new particles
      - Need *O*(10 TeV) Collider to probe 1 TeV mass scale
      - Desired high energy beam requires strong magnets to store and focus beam in reasonable-sized ring.
  - Anti-protons difficult to produce if beam is lost
    - Use proton-proton collisions instead
    - Demand for ever-higher luminosity has led LHC to choose proton-proton collisions
    - Many bunches (high bunch frequency)
    - Two separate rings that intersect at select locations

Today's Accelerators

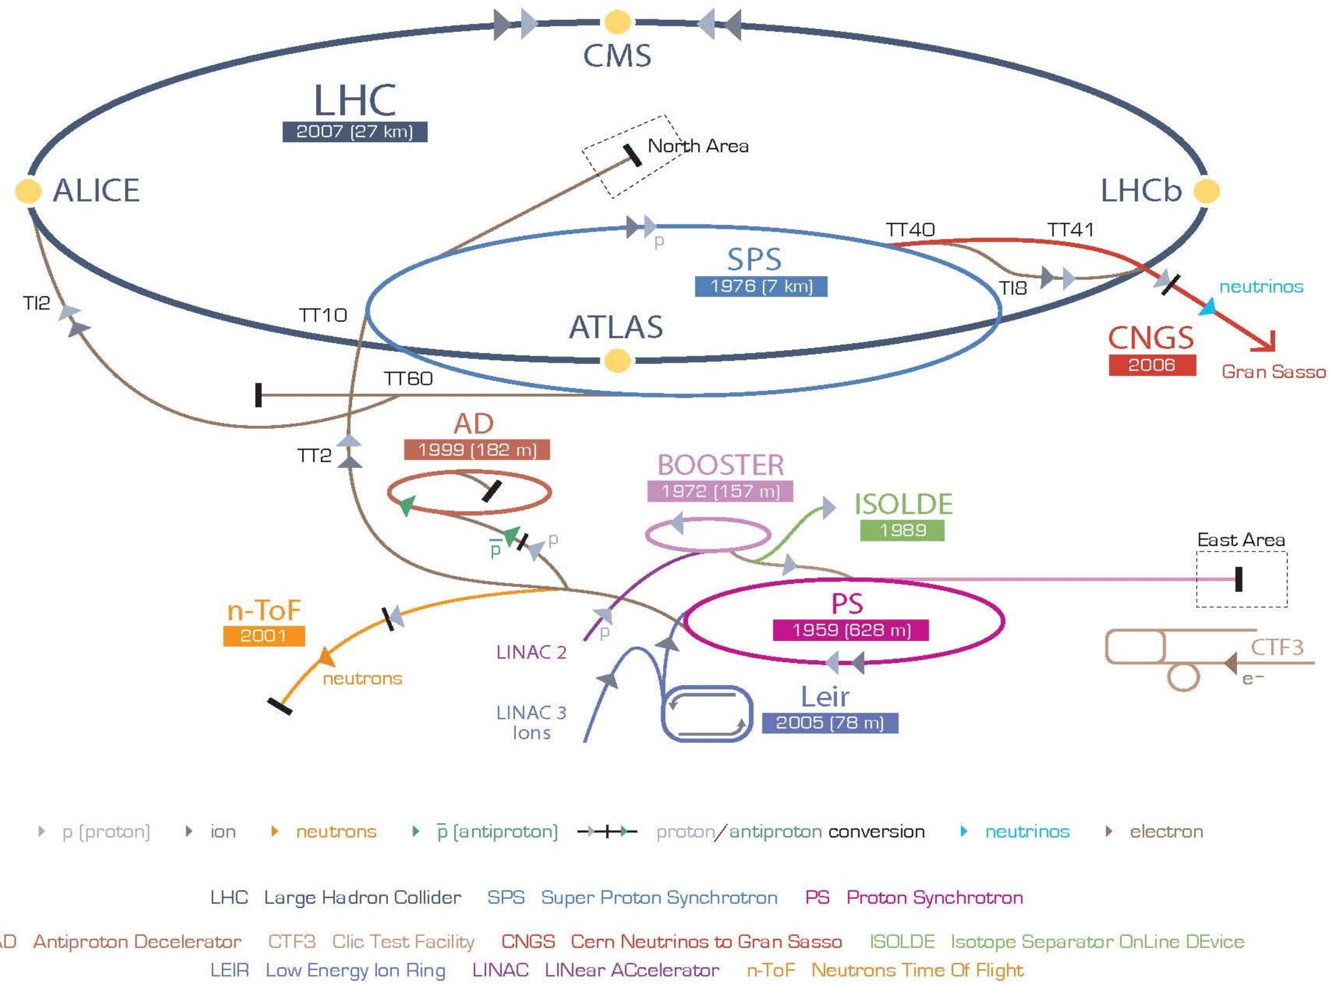
- Lepton Colliders (e+e-)
  - Synchrotron radiation is the most serious challenge
    - Emitted power in circular machine is

$$P_{SR}[\mathrm{kW}] = \frac{88.5\, E^4[\mathrm{GeV}]\, I[\mathrm{A}]}{\rho[\mathrm{m}]}$$

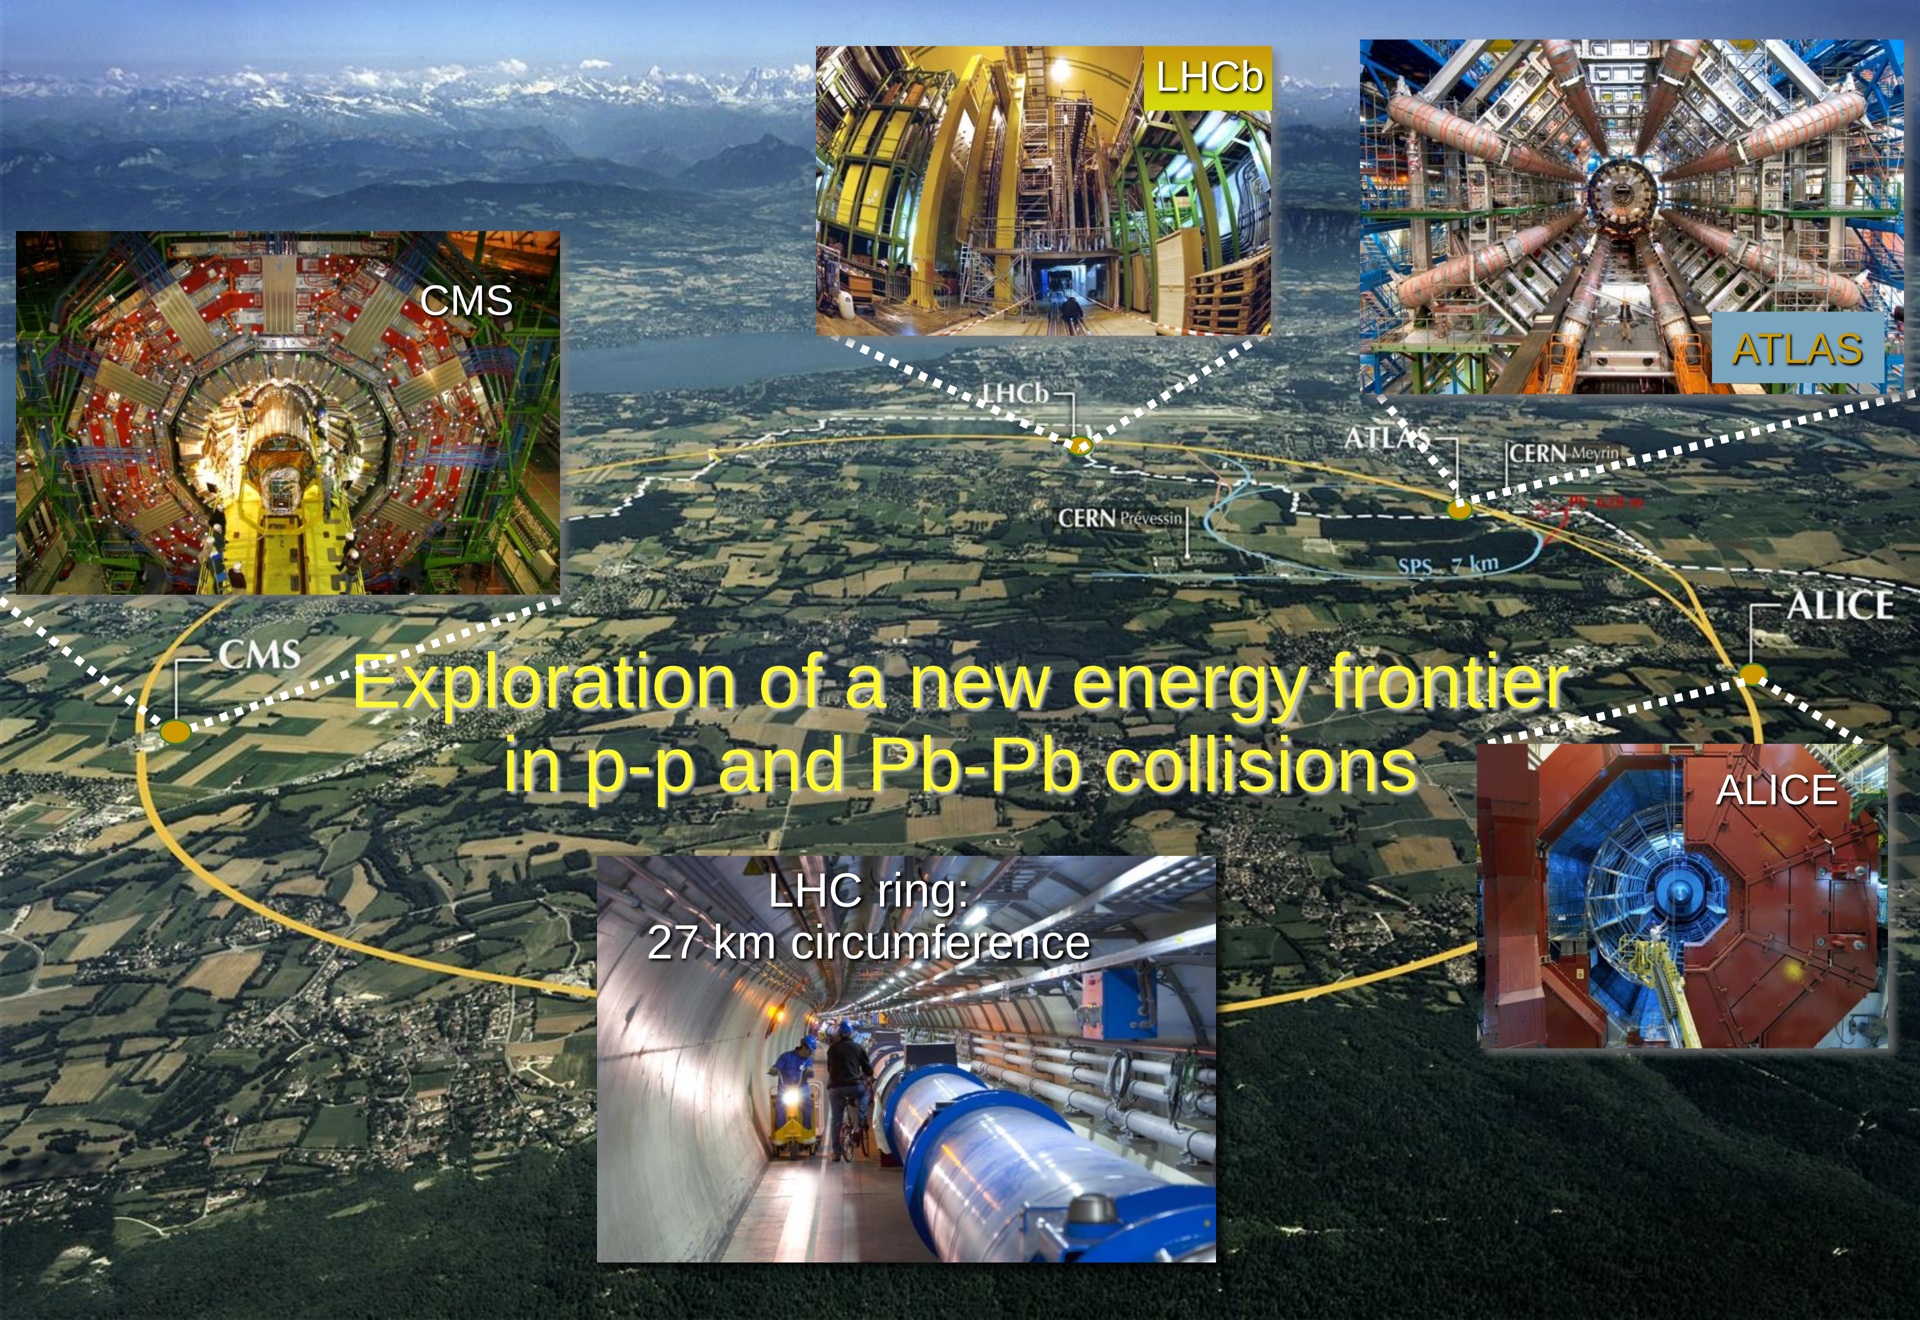
    - For a 1 TeV CM energy Collider in the LHC tunnel with a 1 mA beam, radiated power would be 2 GW
      - Would need to replenish radiated power with RF
      - Remove it from vacuum chamber
  - Approach for high energies is Linear Collider (ILC,CLIC)

THE LHC AND ITS UPGRADES

CERN Accelerator Complex



A New Era in Fundamental Science



Exploration of a new energy frontier
in p-p and Pb-Pb collisions

LHC Main Bending Cryodipole

The LHC Arcs

The LHC Experimental Challenge

LHC Machine Parameters

pp collisions at	$\sqrt{s}$ = 14 TeV
bunch crossing interval	25 nanoseconds
pp interaction rate	10^9 interactions/s

High Interaction Rate

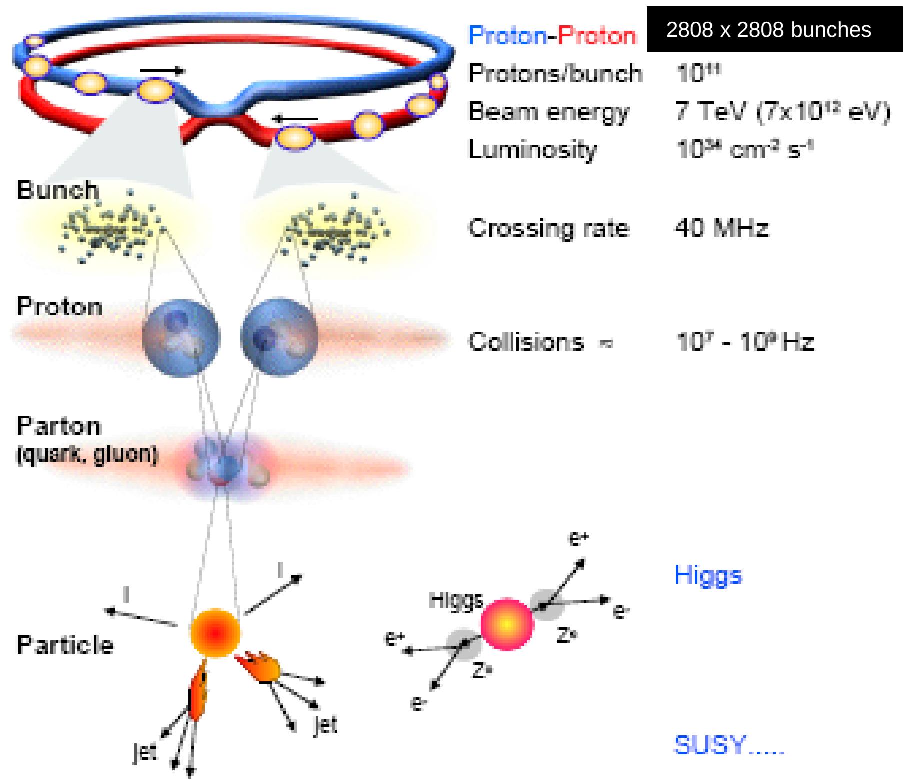
data for only ~100 out of the 40 million crossings can be recorded per second
First trigger decision will take ~2-3 μs
⇒ electronics needs to store data locally (pipelining)

Large Particle Multiplicity

~ <20> superposed events in each crossing
~ 1000 tracks emerge rinto the detector every 25ns
need highly granular detectors
⇒ large number of channels

High Radiation Levels

⇒ radiation hard detectors and electronics



Selection of 1 in 10,000,000,000,000

The Predictable Future - *LHC Timeline*

2009

Start of LHC

Run 1: 7 and 8 TeV centre-of-mass energy, luminosity ramping up to several 10^{33} cm^{-2} s^{-1}, ~25 fb^{-1} delivered

2013/14

LS1 - LHC shut-down to prepare
design energy and no

Study of the properties of the Higgs Boson & physics beyond the Standard Model

nominal (10^{34} cm^{-2} s^{-1}, ~50 to 100 fb^{-1}) and
gy (13 and 14 TeV)

2018

Injector and LHC upgrades to go to ultim

Run 3: Ram
nominal, reaching ~100 fb^{-1} / year

LHC results will guide the way at the energy frontier

~20

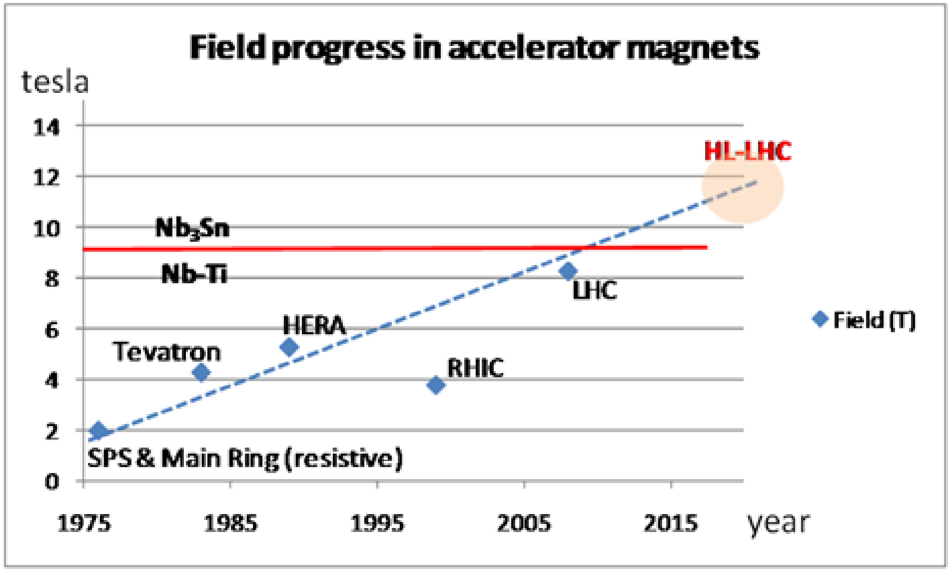
– High-luminosity LHC (HL-LHC). New focusing magnets and CRAB cavities for very high luminosity with levelling

Run 4: Collect data until > 3000 fb^{-1}

>2035

Beam Focusing High-Field SC Magnets

- 13 T, 150 mm aperture quadrupoles for the inner triplet:
  - LHC: 8 T, 70 mm.
- More focus strength, β* as low as 15 cm (55 cm in LHC).
  - In same scheme even β* down to 7.5 cm considered.
- Dipole separators capable of 6-8 T with 150-180 mm aperture (LHC: 1.8 T, 70 mm)



Goal:

Enable focusing of the beams to *β*=0.15 m* in IP1 and IP5.

HL-LHC: In-kind Contribution and Collaboration for Design and Prototypes

BEYOND THE LHC
CIRCULAR COLLIDERS

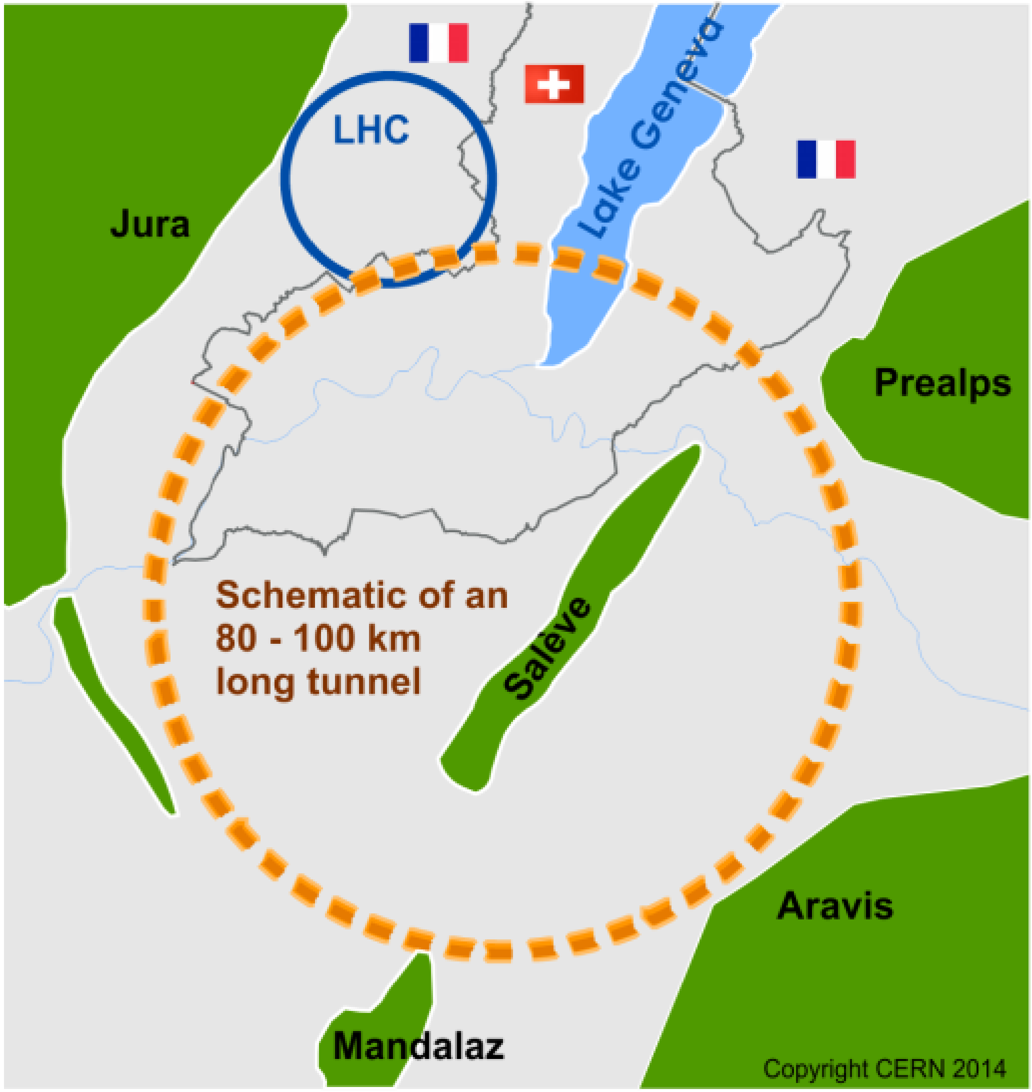
Future Circular Collider Study - SCOPE
CDR and cost review for the next ESU (2018)

Forming an international collaboration to study:

- ***pp*-collider (*FCC-hh*)** → defining infrastructure requirements

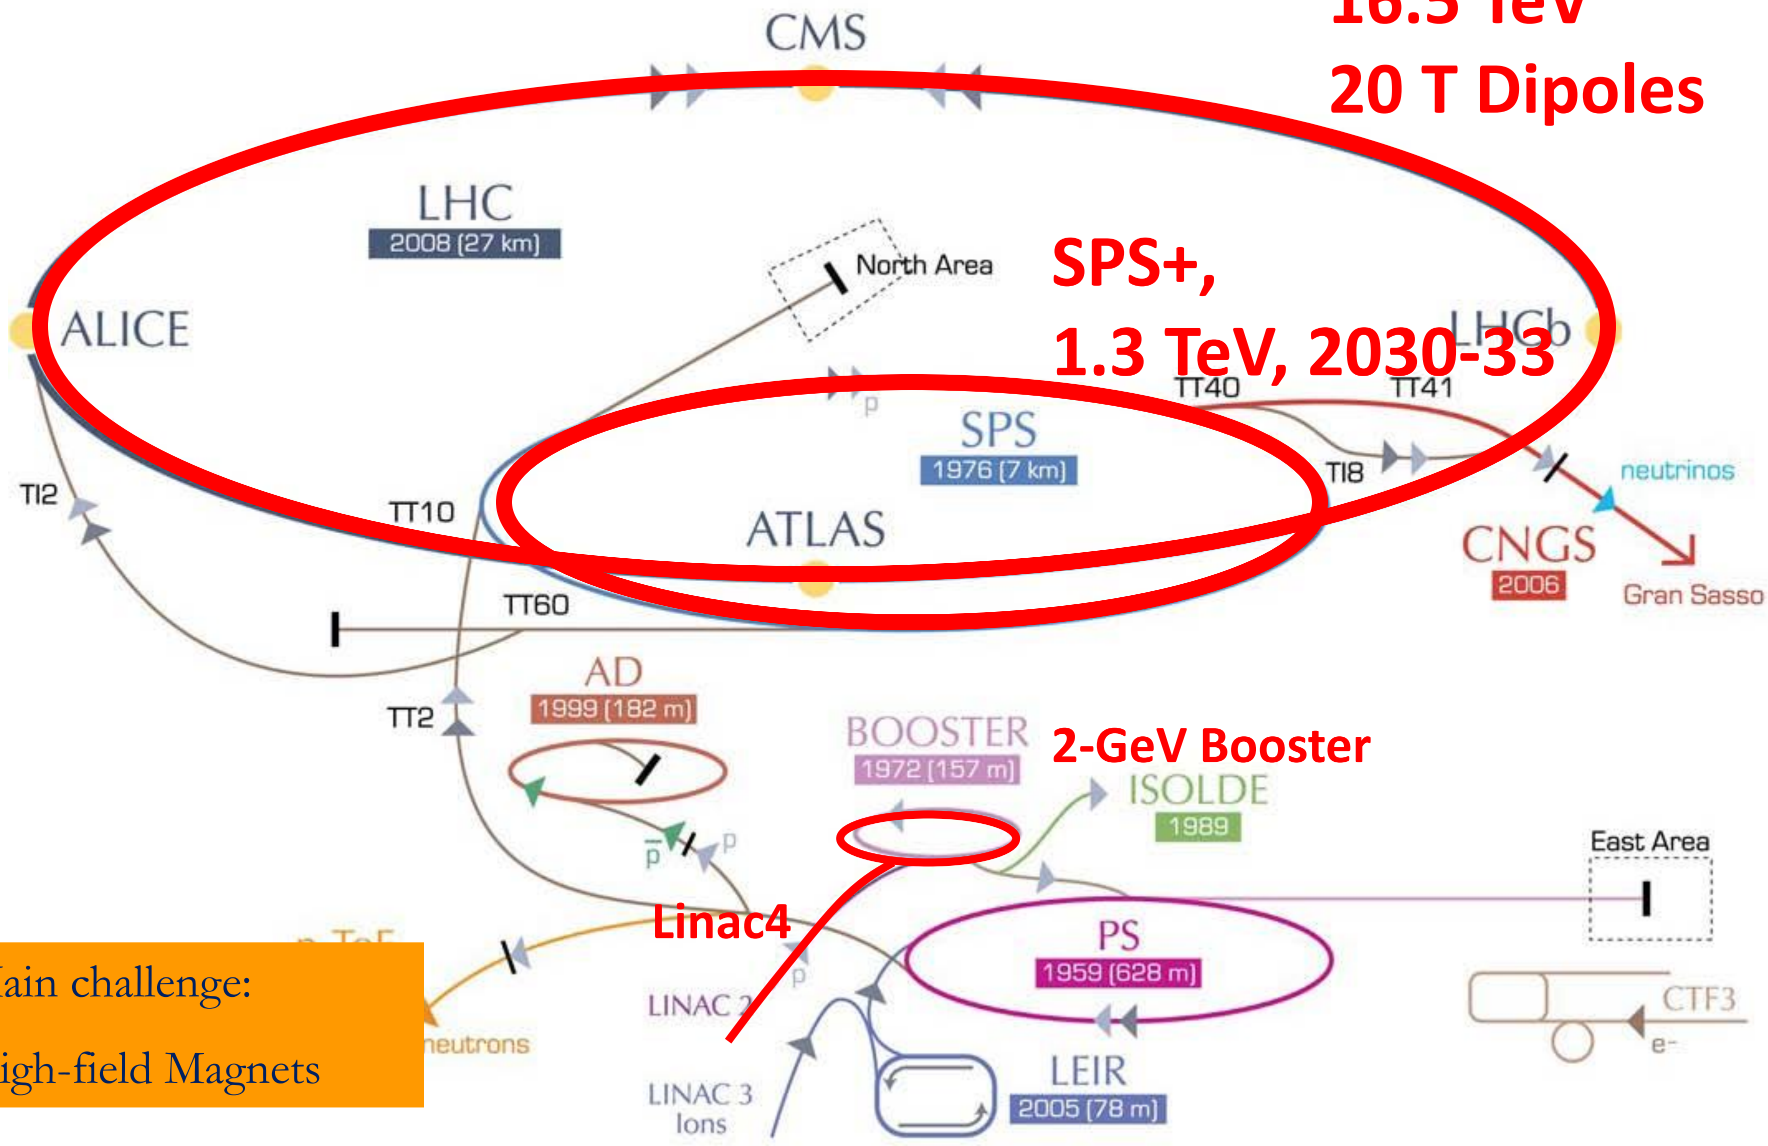
~16 T ⇒ 100 TeV *pp* in 100 km
~20 T ⇒ 100 TeV *pp* in 80 km

- ***e*$^+$*e*$^-$ collider (*FCC-ee*)** as potential intermediate step
- ***p-e* (*FCC-he*) option**
- **80-100 km infrastructure** in Geneva area



High-Energy LHC (HE-LHC)?

HE-LHC >2035
16.5 TeV
20 T Dipoles

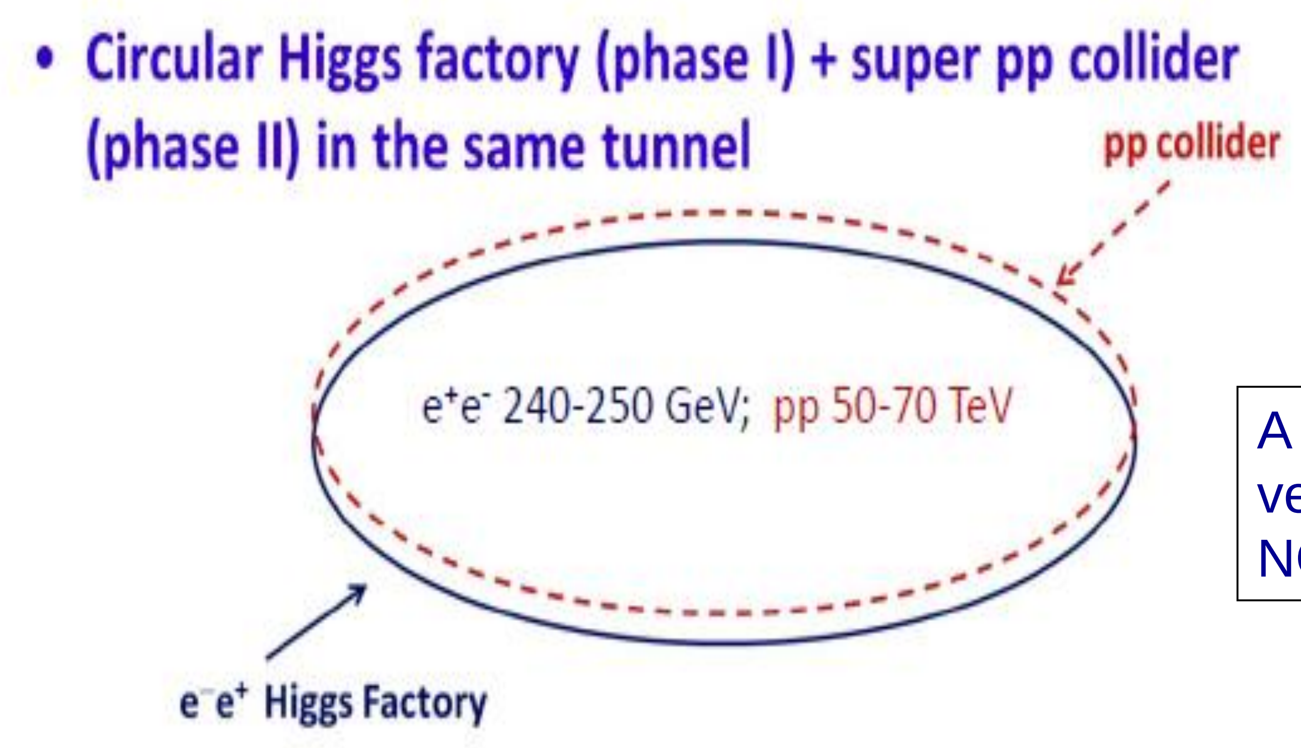


Main challenge:

High-field Magnets

CEPC+SppC

- For about 8 years, we have been talking about “What can be done after BEPCII in China”
- Thanks to the discovery of the low mass Higgs boson, and stimulated by ideas of Circular Higgs Factories in the world, CEPC+SppC configuration was proposed in Sep. 2012

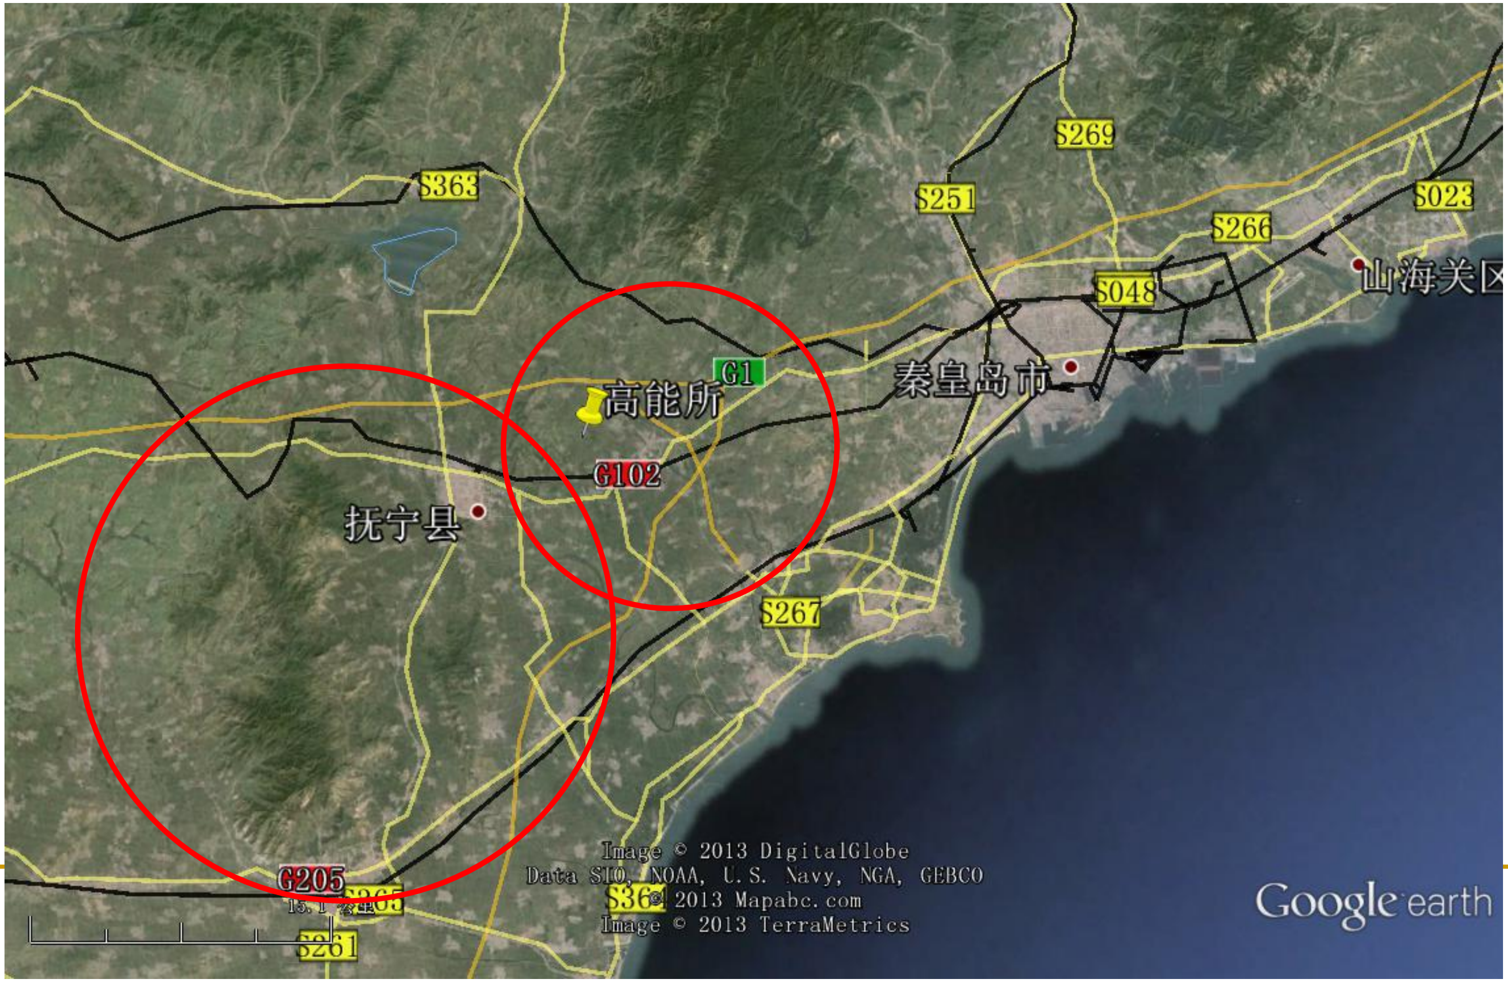


Yifang Wang
Feb. 2014

A 50-70 km tunnel is very affordable in China NOW

Site

- Preliminary selected: Qinhuangdao (秦皇岛）
- Strong support by the local government



CEPC+SppC Current Design

CEPC Basic Parameters:

- Beam energy ~120 -125 GeV
- Synchrotron radiation power ~50 MW
- 50/70 km in circumference

SppC Basic Parameters:

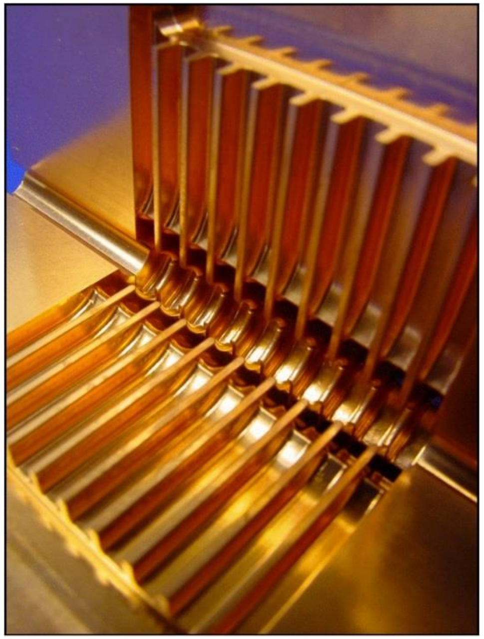
- Beam energy ~50-90 TeV
- 50/70 km in circumference
- Needs B_{max} ~20T

CEPC circumference determined later based on cost estimate.

BEYOND THE LHC
LINEAR COLLIDERS

ILC (and the Compact Linear Collider CLIC)

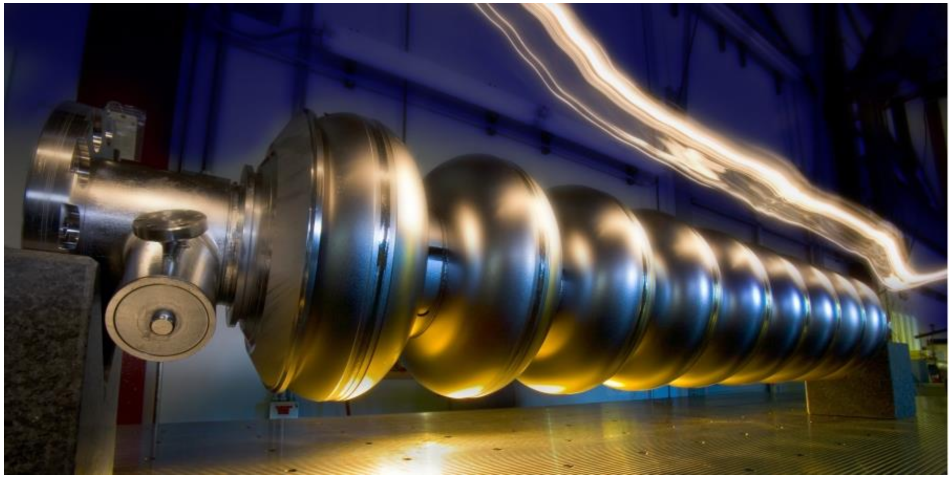
CLIC



•2-beam acceleration scheme at room temperature
•Gradient 100 MV/m
•$\sqrt{s}$ up to 3 TeV
•Physics + Detector studies for 350 GeV - 3 TeV

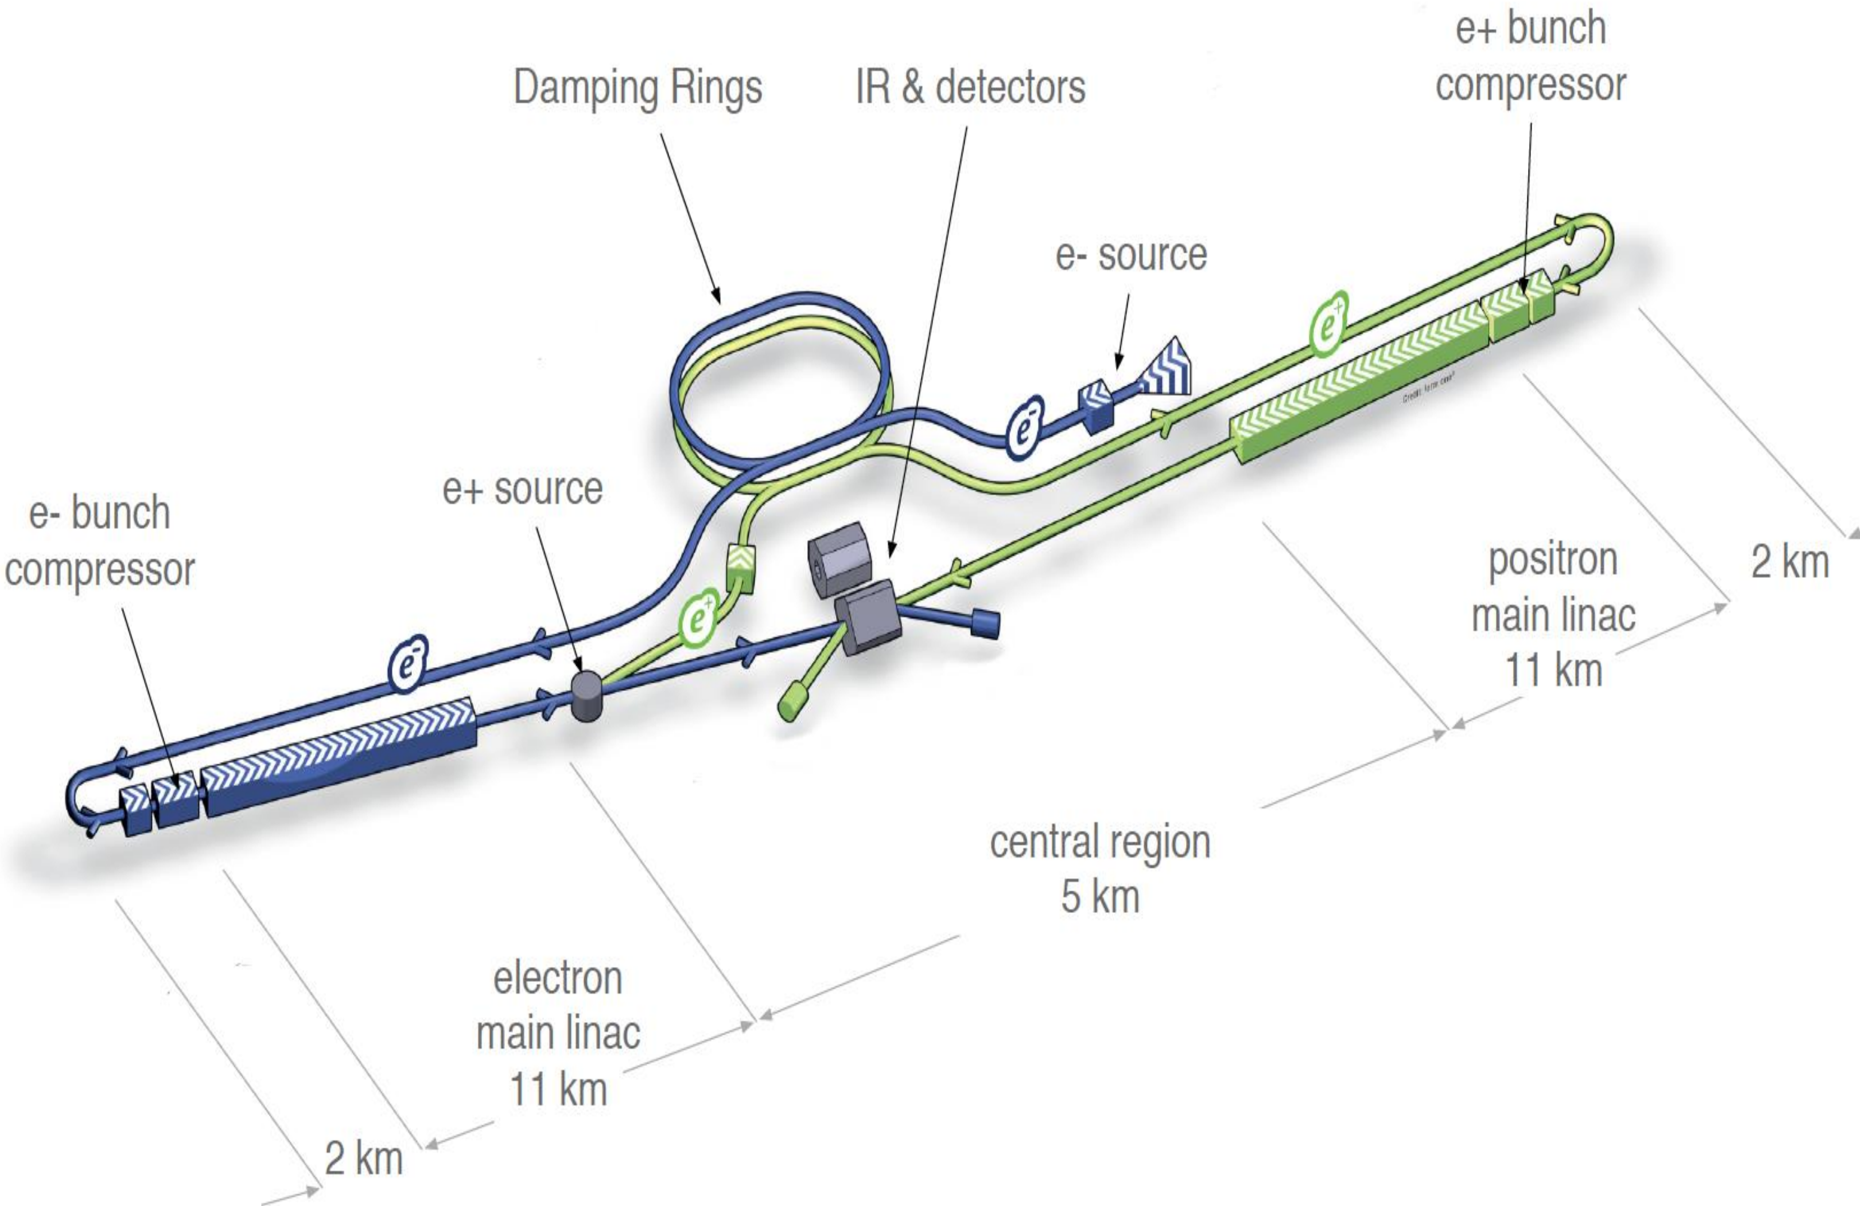
Linear e^+e^- colliders
Luminosities: few 10^{34} $cm^{-2}s^{-1}$

ILC



•Superconducting RF cavities (like XFEL)
•Gradient 32 MV/m
•$\sqrt{s} \leq 500$ GeV (1 TeV upgrade option)
•Focus on ≤ 500 GeV, physics studies also for 1 TeV

The International Linear Collider



shield wall removed

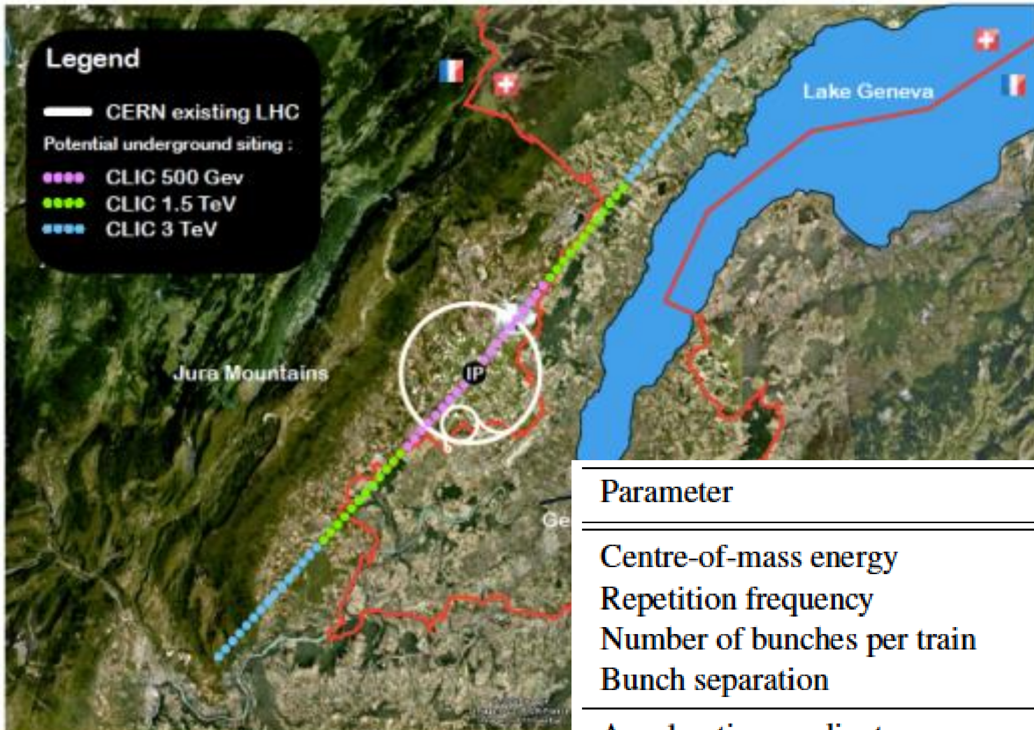
CLIC Implementation



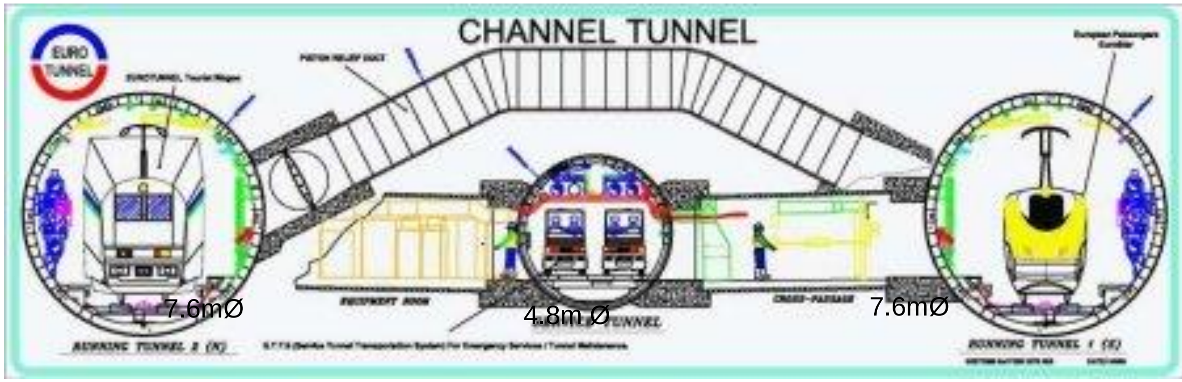
← Possible lay-out near CERN

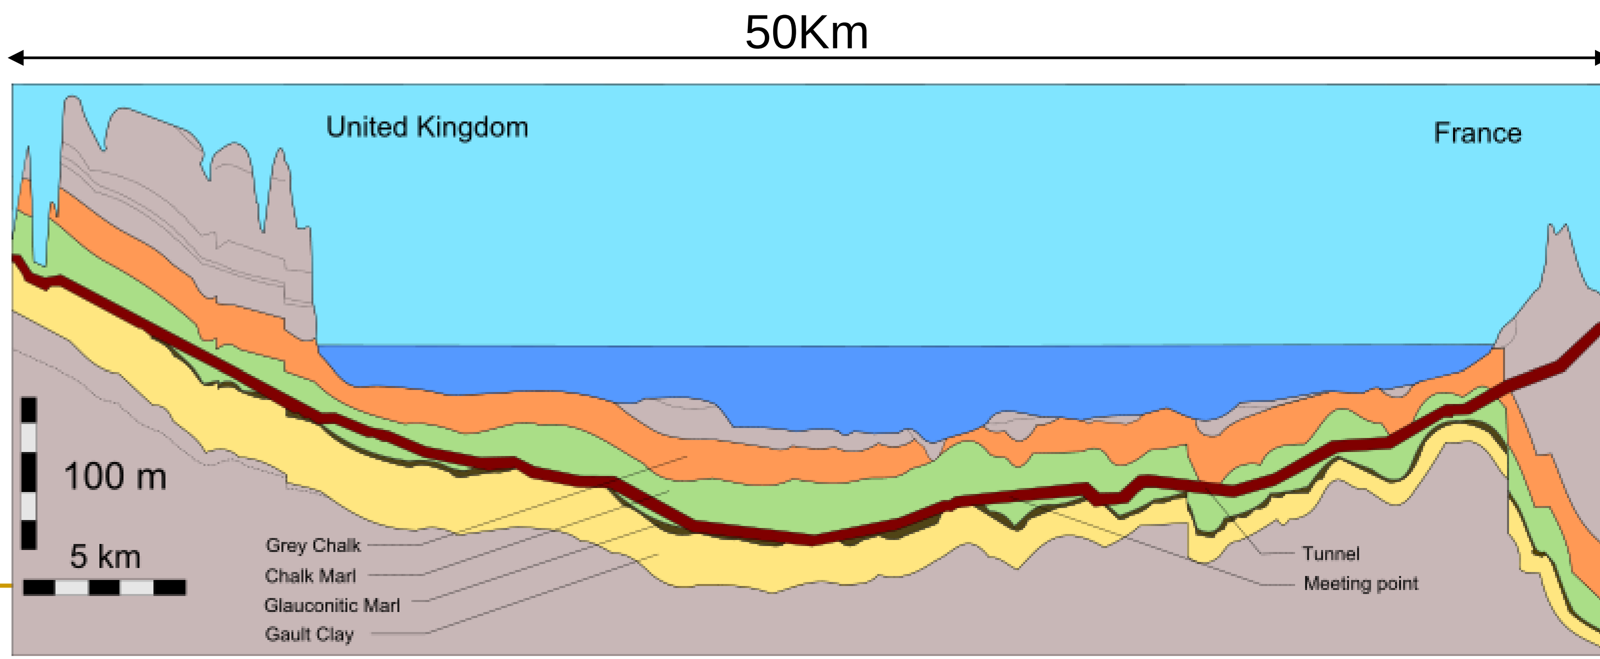
↓ CLIC parameters

Parameter	Symbol	Unit			
Centre-of-mass energy	$\sqrt{s}$	GeV	500	1500	3000
Repetition frequency	f_{rep}	Hz	50	50	50
Number of bunches per train	n_b		312	312	312
Bunch separation	Δ_t	ns	0.5	0.5	0.5
Accelerating gradient	G	MV/m	100	100	100
Total luminosity	$\mathcal{L}$	10^{34} cm^{-2}s^{-1}	1.3	3.7	5.9
Luminosity above 99% of $\sqrt{s}$	$\mathcal{L}_{0.01}$	10^{34} cm^{-2}s^{-1}	0.7	1.4	2
Main tunnel length		km	11.4	27.2	48.3
Charge per bunch	N	10^9	3.7	3.7	3.7
Bunch length	σ_z	µm	44	44	44
IP beam size	σ_x/σ_y	nm	100/2.6	≈ 60/1.5	≈ 40/1
Normalised emittance (end of linac)	$\varepsilon_x/\varepsilon_y$	nm	—	660/20	660/20
Normalised emittance	$\varepsilon_x/\varepsilon_y$	nm	660/25	—	—
Estimated power consumption	P_{wall}	MW	235	364	589

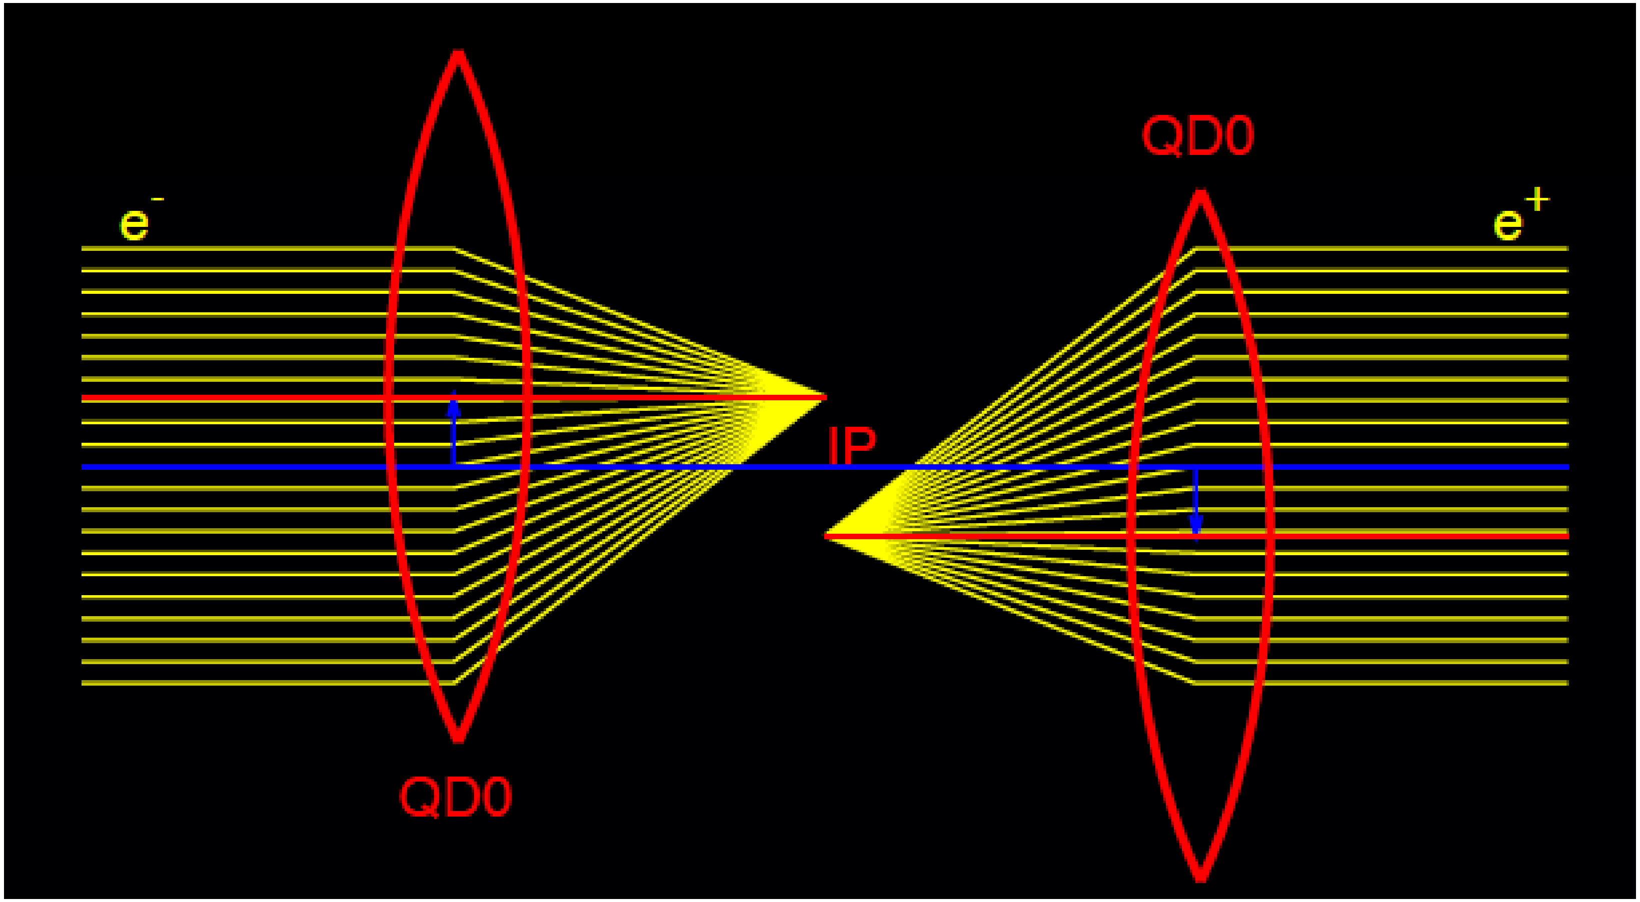
Note: the design is currently being re-optmised, e.g. to include 350 GeV as the first stage

For CLIC & ILC - Similar World Projects: Channel Tunnel





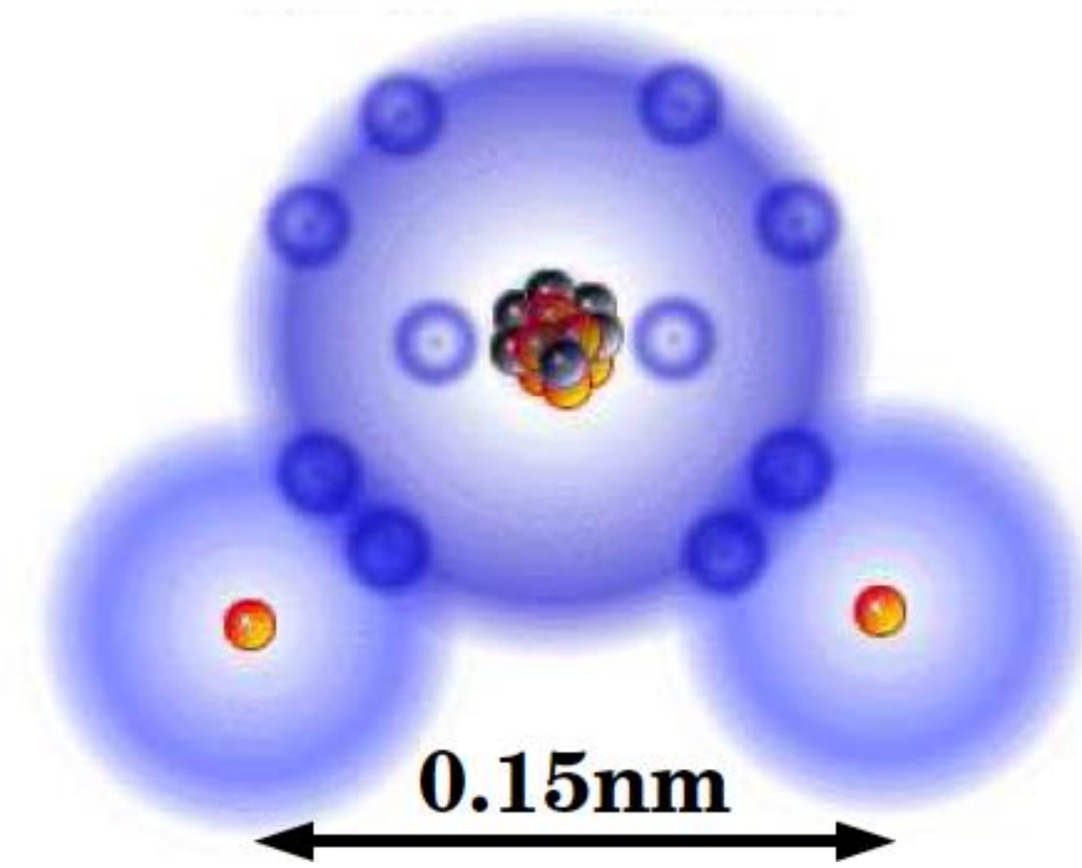
Other Technological Challenges



The final focusing quadruple should be stabilized to 0.15 nm

for frequencies about 4 Hz

Other Technological Challenges



MUON ACCELERATORS

Physics with Muon Beams

- Neutrino Sector

$$\mu^+ \rightarrow e^+ \nu_e \overline{\nu}_\mu \Rightarrow 50\% \nu_e + 50\% \overline{\nu}_\mu$$
$$\mu^- \rightarrow e^- \overline{\nu}_e \nu_\mu \Rightarrow 50\% \overline{\nu}_e + 50\% \nu_\mu$$

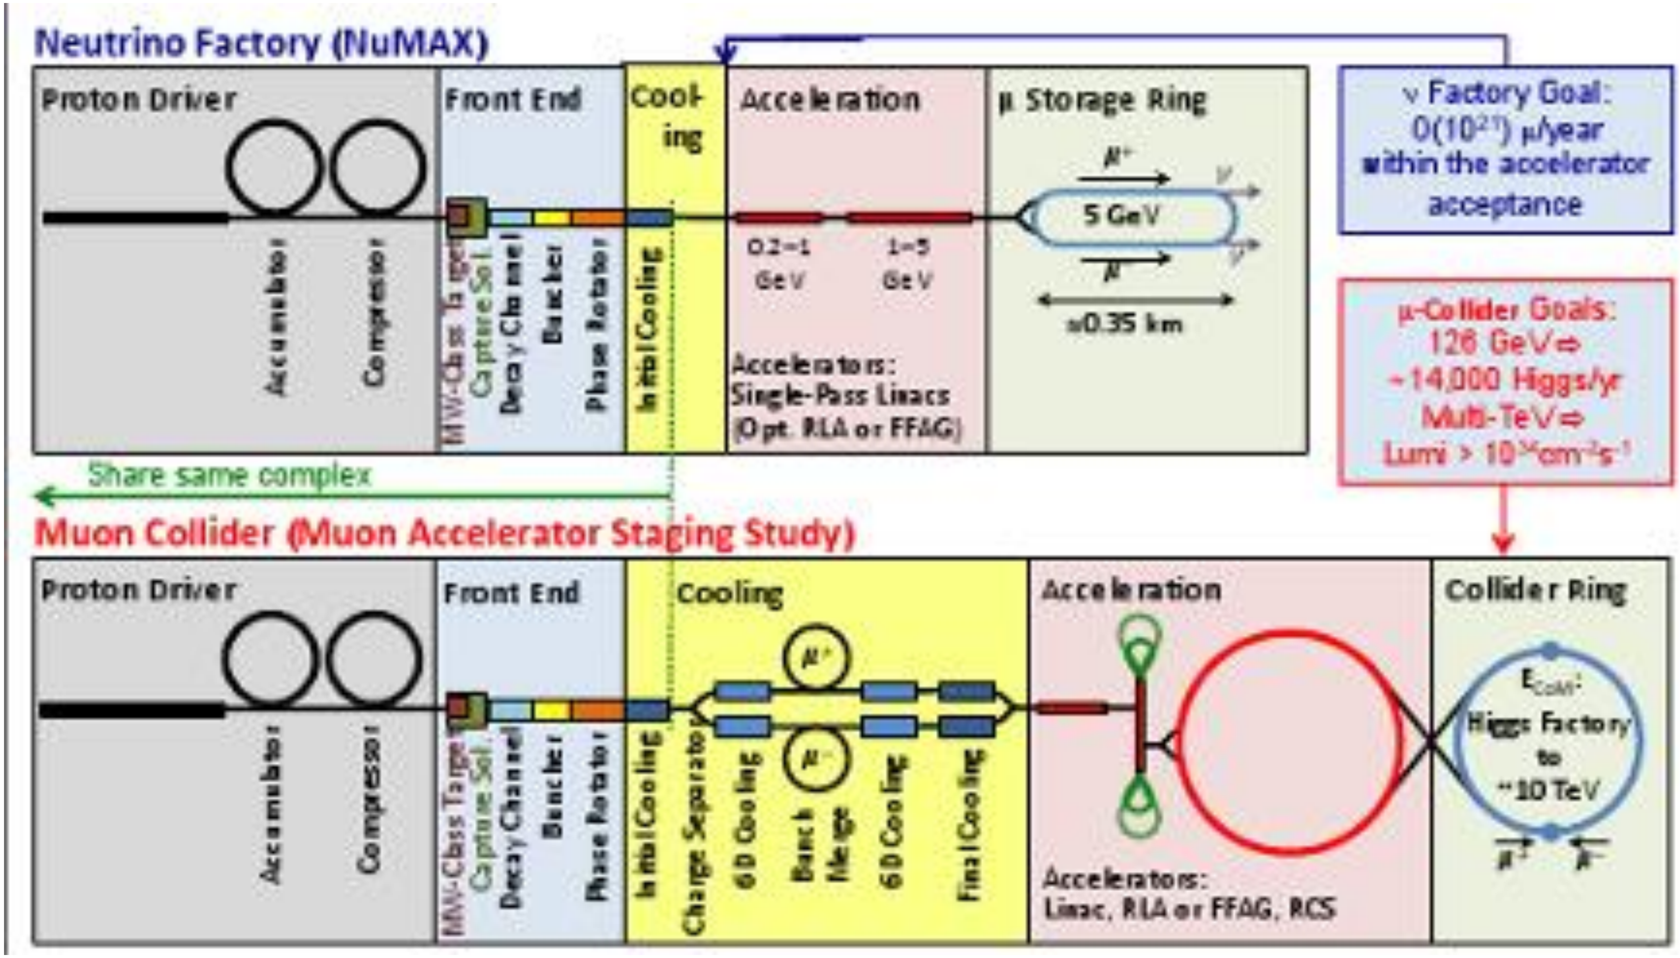
Produces high energy neutrinos

  - Decay kinematics well known
  - $\nu_e \rightarrow \nu_\mu$ oscillations give easily detectable wrong-sign μ
- Energy Frontier
  - Point particle makes full beam energy available for particle production
    - Couples strongly to Higgs sector
  - Muon Collider has almost no synchrotron radiation
    - Narrow energy spread
    - Fits on existing laboratory sites

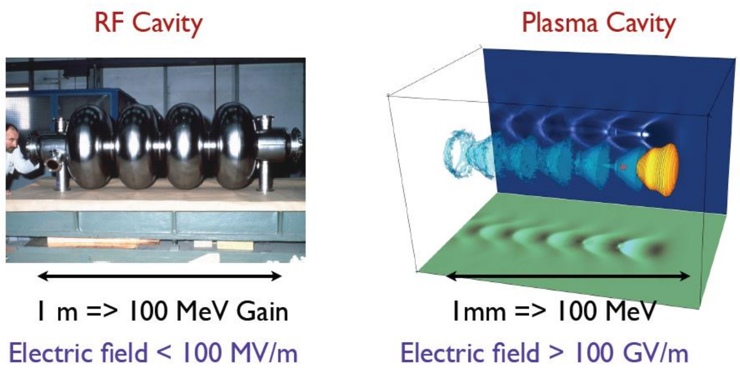
Muon Beam Challenges

- Muons created as tertiary beam ($p \rightarrow \pi \rightarrow \mu$)
  - Low production rate
    - Need target that can tolerate multi-MW beam
  - Large energy spread and transverse phase space
    - Need solenoidal focusing for the low-energy portions of the facility
      - (solenoids focus in both planes simultaneously)
    - Need acceptance cooling
    - High-acceptance acceleration system and decay ring
- Muons have short lifetime (2.2 μs at rest)
  - Puts premium on rapid beam manipulations
    - Presently untested ionization cooling technique
      - High-gradient RF cavities (in magnetic field)
  - Fast acceleration system
- Decay electrons give backgrounds in Collider detectors and instrumentation & heat load to magnets

Muon Collider (?)



Plasma Accelerators



V. Malka *et al.*, Science **298**, 1596 (2002)

e.g. AWAKE at CERN

Demonstration experiment to verify novel technique of p-driven plasma wakefield acceleration

Plasma accelerators:

Transform transverse fields into longitudinal fields.

Significantly higher accelereating gradients than conventional RF.

- **Laser driven**
- **e- driven**
- **p driven**
- **Dielectric wakefields**

The Sub-Fermi Scale (2015-2050)?
