Charmonium Tetraquark:

$1^{++} \text{ cc}^* \text{ X}(3872)$

X(3872) mass compared with DD* thresholds

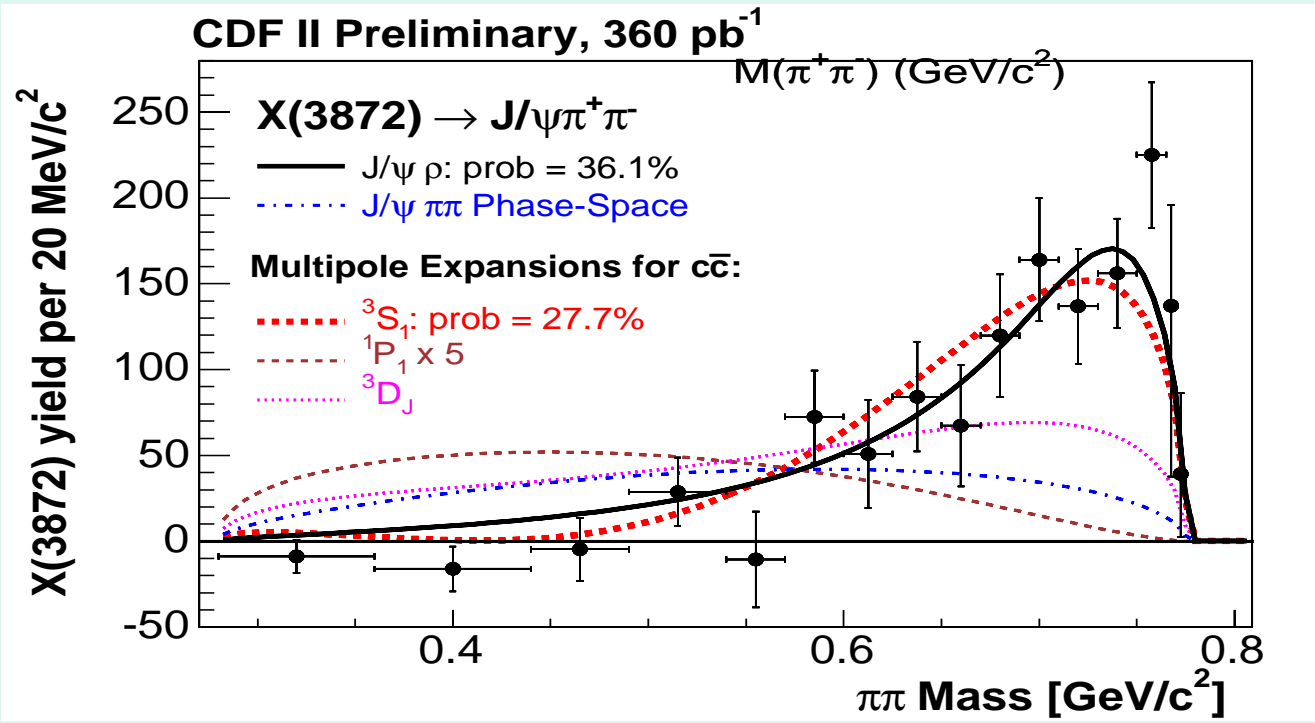

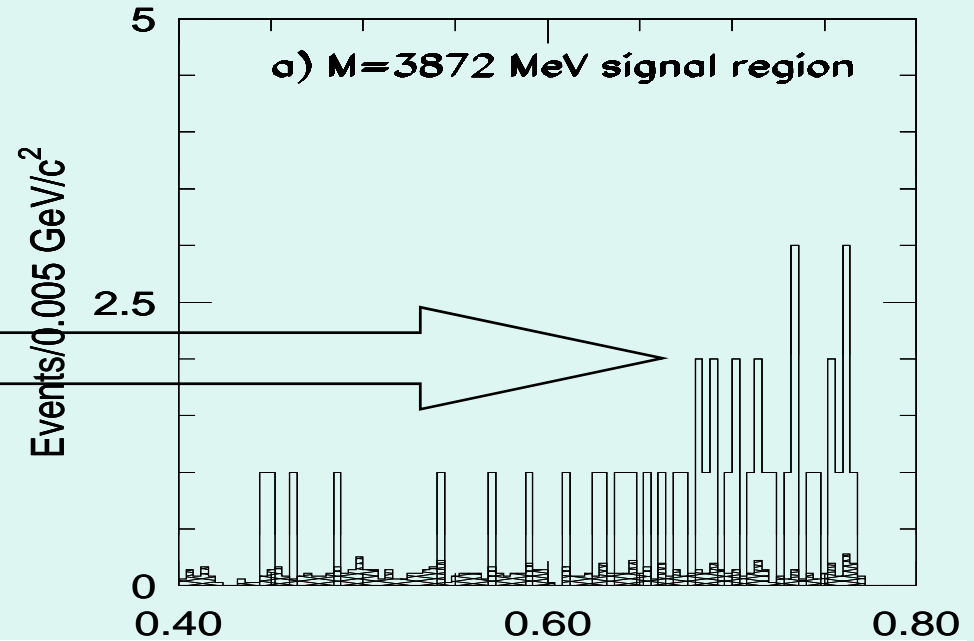

DD* molecule “tetraquark” Mass = neutral threshold to better than 1 in 10,000

cuc* u* S-wave $J^{PC} = 1^{++}$ isospin maximally broken

$X \rightarrow \psi \pi \pi$ is really

$X \rightarrow \psi \rho$!!!

Close+Page
Tornqvist
Swanson

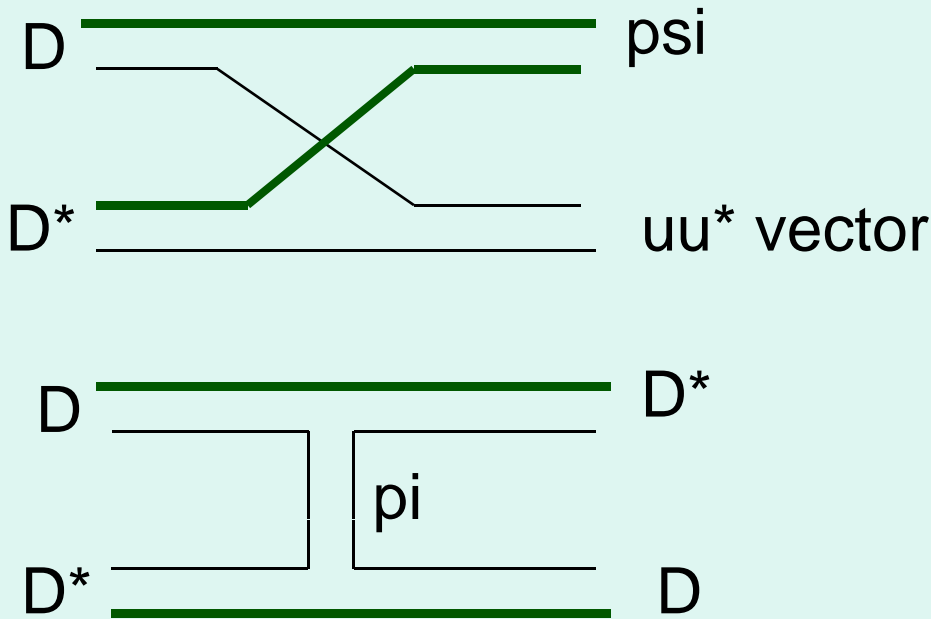

$cc^* 1^{++} 3550; 1^{++*} 3950:$

P-wave cc^*

DD^* (neutral) threshold
Psi rho; psi omega

S-wave 1^{++} mesons

Mass coincidence only happens with Charm, not strange or bottom

Energy degeneracy
Psi rho:psi omega ~ 1
Specific model: Swanson
(Recall for $Y(4260)$ later)

DD* (neutral) threshold } S-wave 1++ mesons
 Psi rho; psi omega

Q exch not enough

Pi exchange drives attraction

An extra narrow charmonium state

$$X(3872) \rightarrow \psi\pi\pi$$

Current opinion:

1^{++} cc^* with large tetraquark cc^*uu^* admixture:

Test: produce in $B^+ \rightarrow B^0$

$X \rightarrow K^+K^-\pi \gg K^0K^0\pi$

CLEOc/BES precision test for 1^{++} 3550 also

Beyond spectroscopy:

**Hybrid decays and production.
+ new insights from Lattice QCD**

flux-tube breaking and decays

Isgur Paton 92 light exotics

FC Page 95 all

Break tube: S+P states yes; S+S suppressed

e.g. $1^{--} \Rightarrow \pi + (^1P_1)$ or $(^3P_1)$

	$\pi_1 \rightarrow b_1(^1P_1)\pi$	$\pi_1 \rightarrow f_1(^3P_1)\pi$	
Lattice	2.9 ± 0.4	1.5 ± 0.4	← Michael McNeile 06
Flux tube	2.9	1.4	← FC Burns 06

flux-tube breaking and decays

Break tube: S+P states yes; S+S suppressed

S+S = 0 for hybrid charmonium

(FC + Page predictions 1995)

Look for $DD_{\{0,1\}}$; a bit of DD^* and absence of DD or D^*D^* and of $DsDs$ or Ds^*Ds^*

ψf_0 ; $\psi \pi\pi$; $\chi \eta$; $h_c \eta$ also

The large $\psi + \pi \pi$

S-wave, relative mom ~ 0 ;

DD_1 interchange constituents to make $\psi \pi\pi$ “strongly”
(c.f. Swanson model of $3872 \text{ } DD^* \rightarrow \psi \omega$)

FIG. 3: The dipion mass distribution for $Y(4260) \rightarrow \pi^+\pi^- J/\psi$ data is shown as points with error bars. The histogram shows the distribution for Monte Carlo events where $Y(4260) \rightarrow \pi^+\pi^- J/\psi$ is generated according to an S -wave phase space model.

FIG. 3: The dipion mass distribution for $Y(4260) \rightarrow \pi^+\pi^- J/\psi$ data is shown as points with error bars. The histogram shows the distribution for Monte Carlo events where $Y(4260) \rightarrow \pi^+\pi^- J/\psi$ is generated according to an S -wave phase space model.

The mass coincides with the $D_1(2420)D$ threshold:

The decay modes $\psi\sigma/\eta$, $\psi f_0(980)/a_0(980)$ appear to dominate:

$\Gamma(Y(4260) \rightarrow e^+e^-)$ is much smaller than all other 1^{--} charmonia:

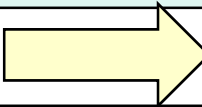

$$5.5 \text{ eV} \leq \Gamma(Y(4260) \rightarrow e^+e^-) \lesssim 62 \text{ eV},$$

$\Gamma(Y(4260) \rightarrow \psi\pi^+\pi^-)$ is much larger than all 1^{--} charmonia:

$$\Gamma(Y(4260) \rightarrow \psi\pi^+\pi^-) \gtrsim 7.8 \text{ MeV}.$$

All consistent with **predictions** for hybrid charmonium

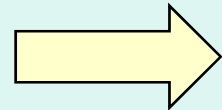

$e^+e^- \rightarrow \pi^+\pi^-\pi^+\pi^-$, $K^+K^-\pi^+\pi^-$, and $K^+K^-K^+K^-$ cross sections at center-of-mass energies 0.5–4.5 GeV measured with initial-state radiation

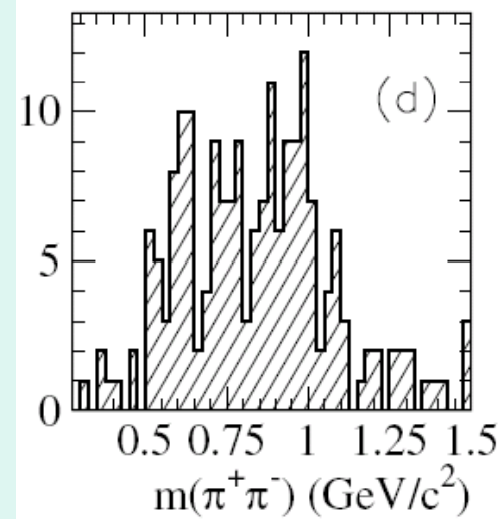

$e^+e^- \rightarrow$  KK_1

Future need to do:
Compare this with the
DD_1 / psi ppi case:

M(pipi);
phi (psi) polarisation

 ϕ $\pi\pi$

e^+e^- \longrightarrow KK_1

phi

pi pi

Intriguing resonant signal at 2190
= phi(hybrid)??

2190 – m(phi)
=
4265 – m(psi)
!!??

Four Quark Interpretation of $Y(4260)$

L. Maiani* and V. Riquer†

Università di Roma 'La Sapienza' and I.N.F.N., Roma, Italy

F. Piccinini‡

I.N.F.N. Sezione di Pavia and Dipartimento di Fisica Nucleare e Teorica, via A. Bassi, 6, I-27100, Pavia, Italy

A.D. Polosa§

Dip. di Fisica, Università di Bari and I.N.F.N., Bari, Italy

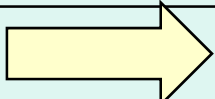

$$Y(4260) = ([cS]_{S=0} [\bar{c}\bar{S}]_{S=0})_{\text{P-wave}}$$

$$\Gamma_Y(D_s \bar{D}_s) \gg \Gamma_Y(D \bar{D})$$

Dominant $D_s \bar{D}_s$ decay is quite a distinctive signature of the validity of the present model.

This is a clear distinction with hybrid for which this is \sim zero

Is it an S wave attraction?

e^+e^-  DD_1

is first S-wave charm threshold
and occurs ~ 4.2 GeV !

S-wave, relative mom ~ 0 ;

DD_1 interchange constituents to make ψ $\pi\pi$ “strongly”
(c.f. Swanson model of 3872 DD* \rightarrow ψ ω)

Pi exchange drives attraction

1- - isoscalar: like 4260

1- + isovector: doubly exotic!

Y(4260) Three Possibilities

Y(4260) = S wave effect

My worry

$Y(4260) = ([cs]_{S=0}[\bar{c}\bar{s}]_{S=0})_{P\text{-wave}}$

Maiani

Y(4260) as hybrid charmonium

Close

DD_1 and not DsDs for hybrid

DsDs and not DD_1 for tetraquark

Experiment
can decide

Y(4260) Three Possibilities

Y(4260) = S wave effect

My worry

$Y(4260) = ([cs]_{S=0}[\bar{c}\bar{s}]_{S=0})_{P\text{-wave}}$

Maiani

Y(4260) as hybrid charmonium

Close

If NOT hybrid cc^* then why not/where is it ?!

DD_1 and not DsDs for hybrid

DsDs and not DD_1 for tetraquark

Experiment
can decide

end

Is it really a resonance?

$e^+e^- \longrightarrow DD_1$

is first S-wave charm threshold and occurs ~ 4.2 GeV !

S-wave, relative mom ~ 0 ;

DD_1 interchange constituents to make ψ $\pi\pi$ "strongly"
(c.f. Swanson model of 3872 $DD^* \rightarrow \psi \omega$)

$e^+e^- \longrightarrow D_s D_{s1} \longrightarrow \psi KK$ should show similar

Psi polarisation test in X(4260) \to psi pipi

Hybrid cc^* has $\text{spin}(cc^*)=0$ (!)

Swanson exchange model \Rightarrow psi polarised transverse

FC Swanson

If $\text{spin } cc^* = 1$ (conventional) psi polarisation different
but model dependence to be understood

In any event, poln measure should be done and
compared with phi in the KK_1 region

S=1 qq* pair creation triggers decays
+ algebraic 6j 9j factorisation

Production of: qq* + qq*
Hybrid + qq*
Hybrid + Hybrid

$e+e^- \rightarrow \psi + (0^{--} \text{ or } 1^{--})\text{Hyb} = 0$

Not hybrid!

But.....
