Monitoring Visual Analytics About Team Contact

Home / Analytics / Overview / John Smith

**John Smith** potential threat

45 year old Male  
 Department: Research & Development  
 Job Title: Data Analyst  
 Security Clearance: Level 2

**Data Analyst** - 28th Feb 13 - 19th Jan 2015

Salary: £26,000 (Pay grade: 7.1)  
 Line Manager: M. Suley

Bonuses	Awards	Observations	Grievances
5	5	5	5

**Software Developer** - 21st Aug 08 - 28th Feb 13

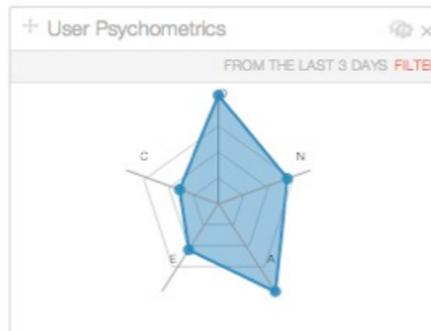

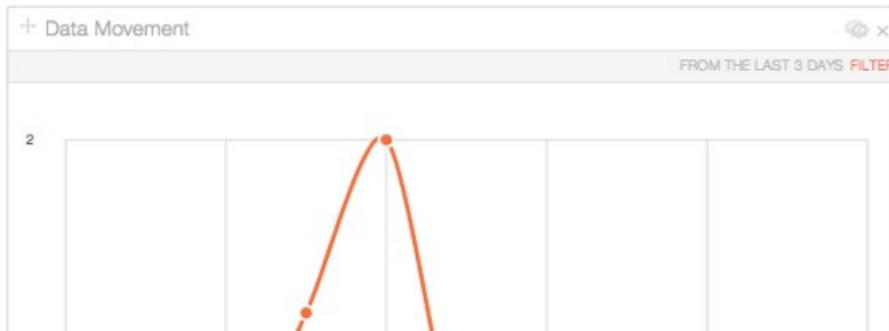

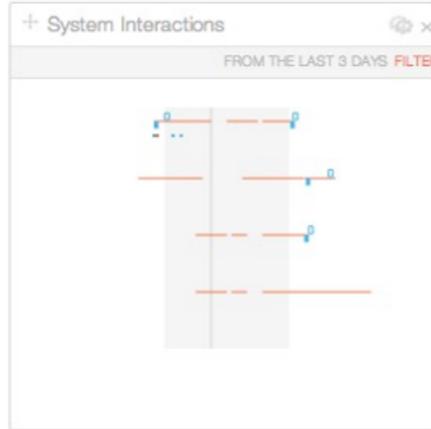

**Trainee** - 28th Feb 08 - 24th Jun 08

**Notes**

**Erratic login patterns**  
 I noticed that logins are becoming a bit more unpredictable. Could be worth keeping an eye on this.  
 Recorded by E. Maguire at 9.34am on May 2nd 2013

**Substantial increase in download rate**  
 This was attributed to downloading scientific data for a project. Anomalous, but not significant.  
 Recorded by P. Legg at 2.40pm on April 27th 2013

# Parallel Coordinate Plots

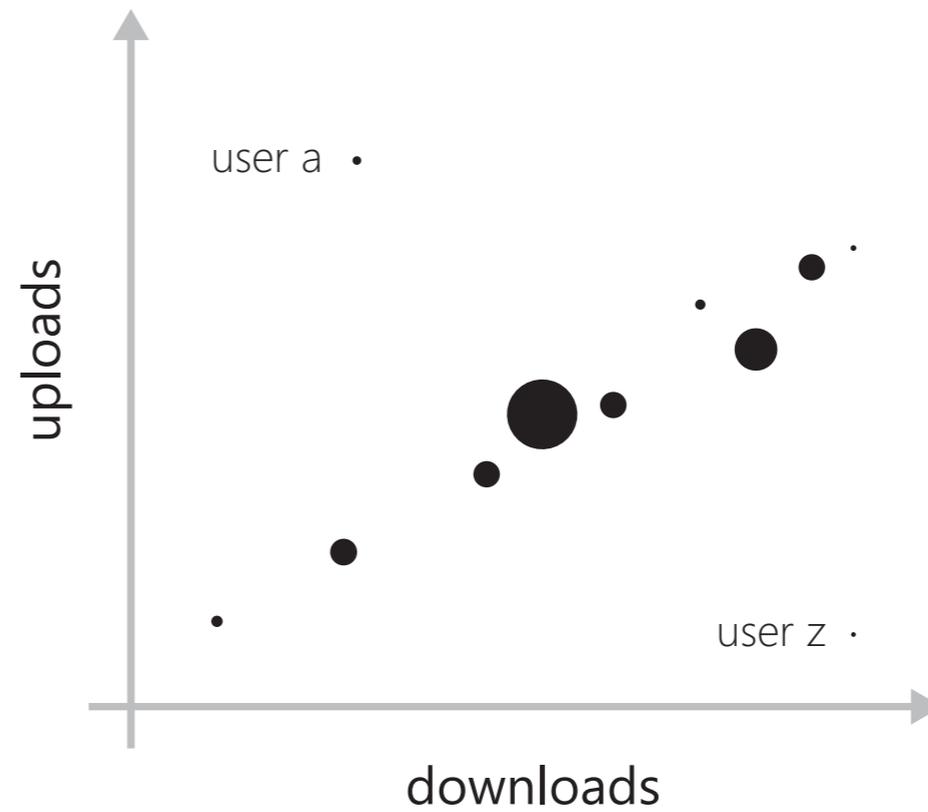

Lets take an example where we have many variables to display...  
Each user is represented by a circle

## 2 Dimensions

## 3 Dimensions

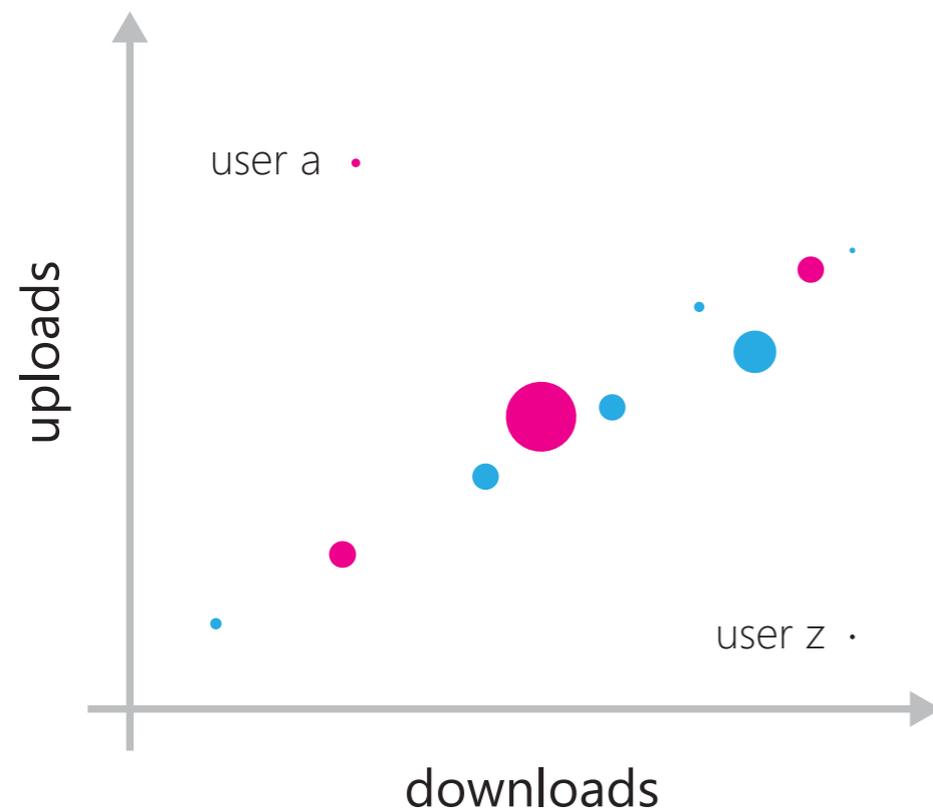

Size indicates number of logins per day

# Parallel Coordinate Plots

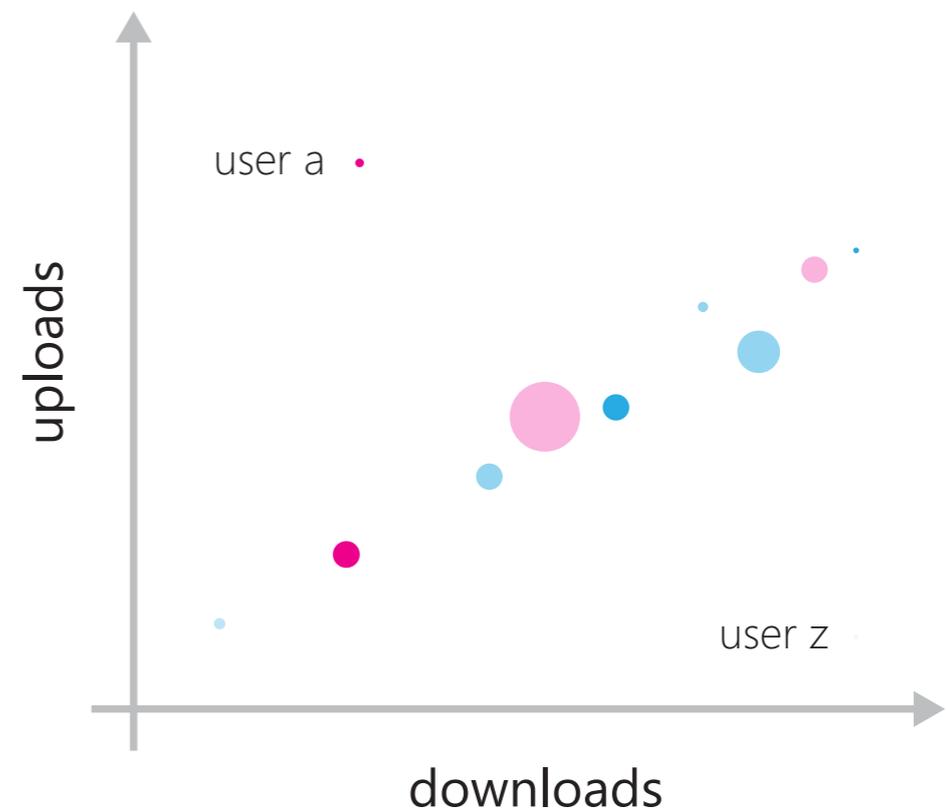

## 4 Dimensions

Color indicates users department

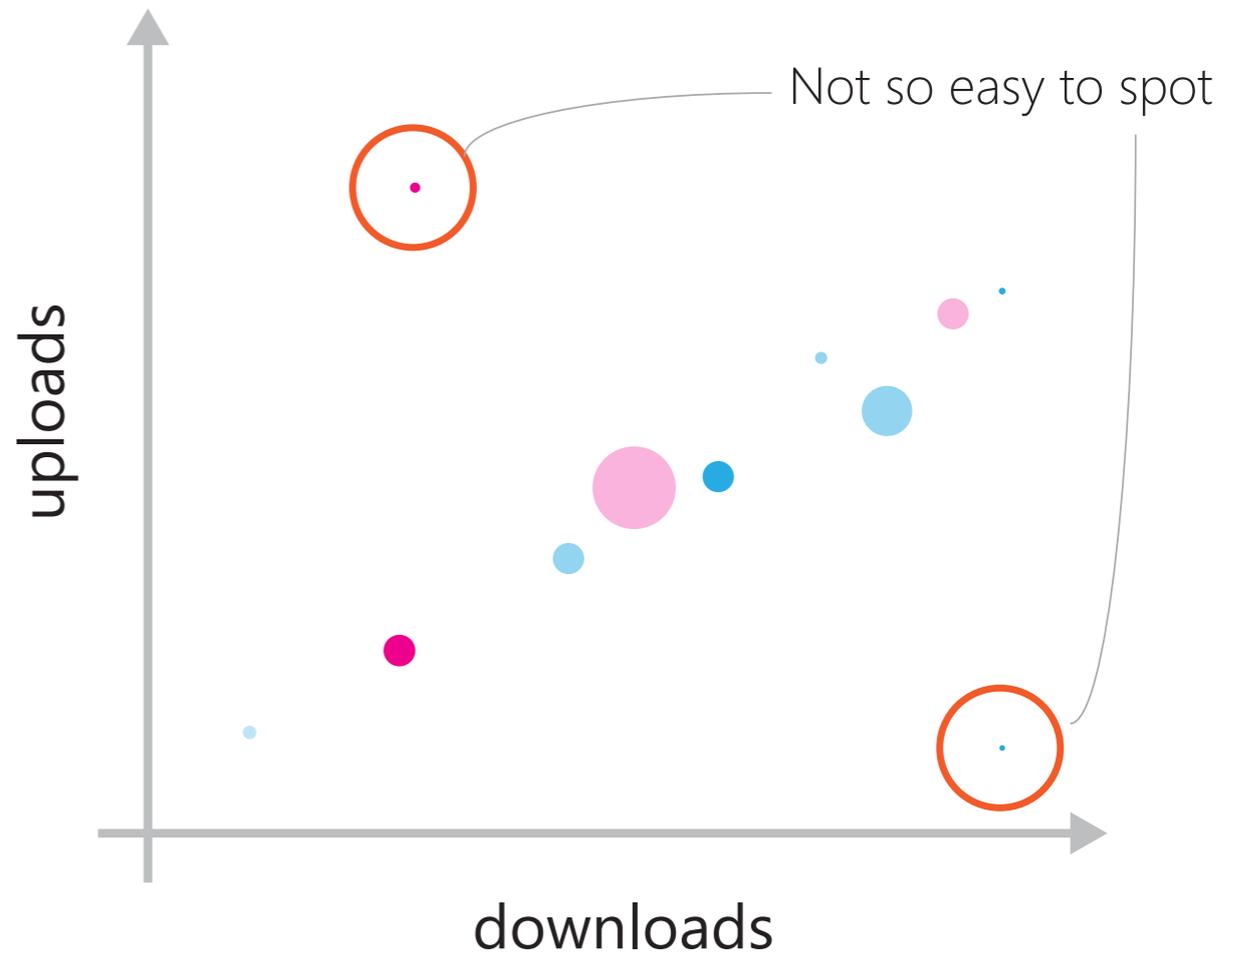

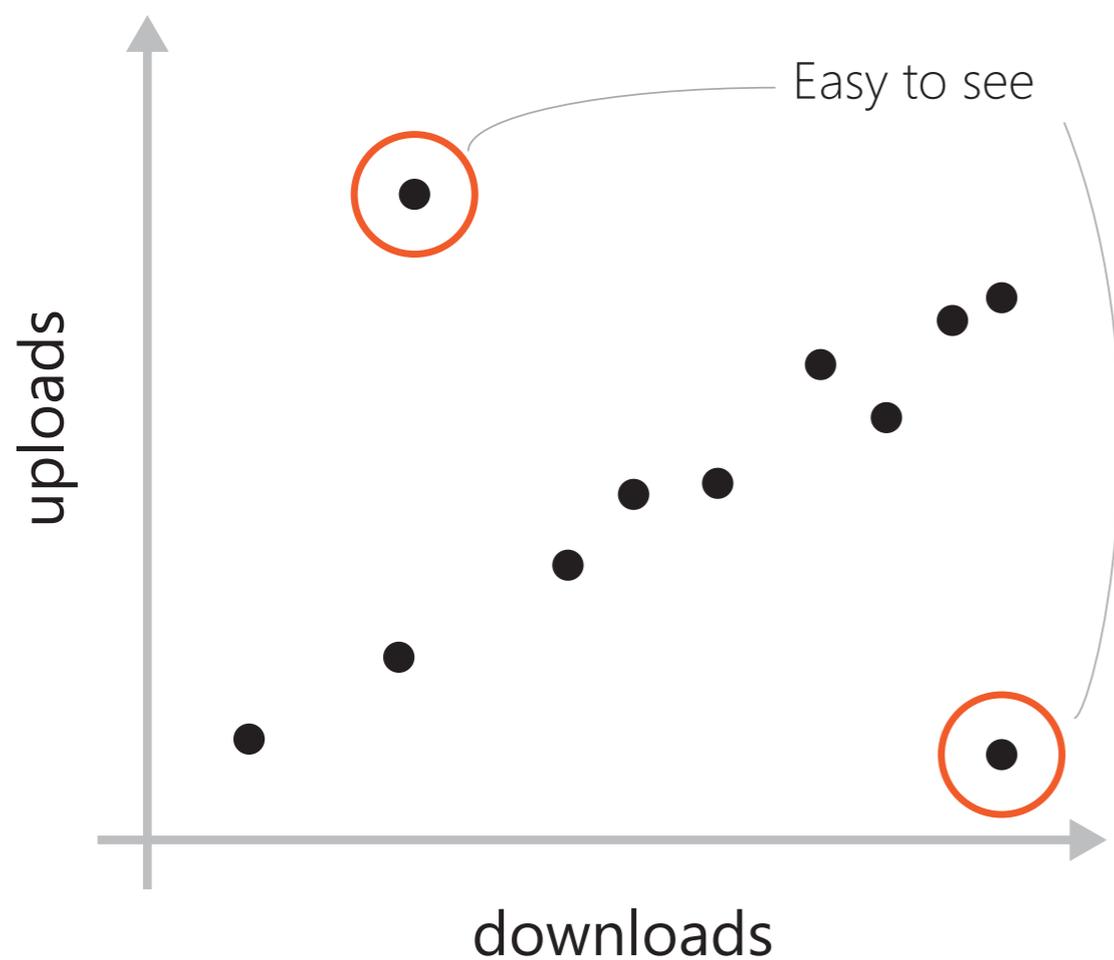

## 5 Dimensions

Transparency indicates consistency in logins

As we get to higher levels of dimensions, we'll have problems. Our choice of visual encoding will affect the visual availability of each dimension to the user.

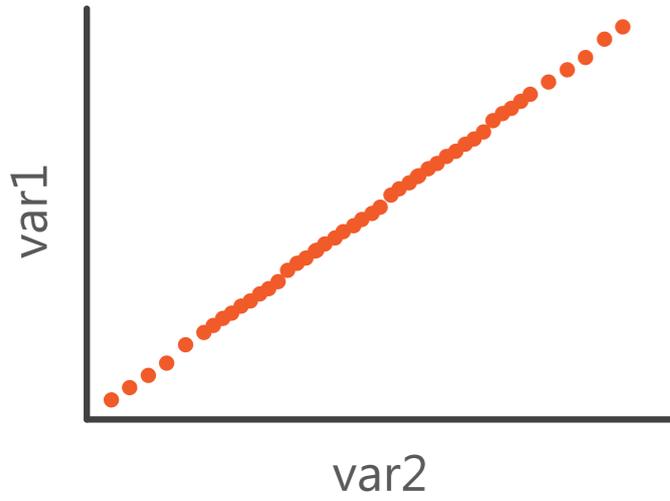

Parallel coordinates are a visualization technique employed when a large number of dimensions need to be displayed (often without a temporal element) and where each of those dimensions can be equally important in the decision making process.

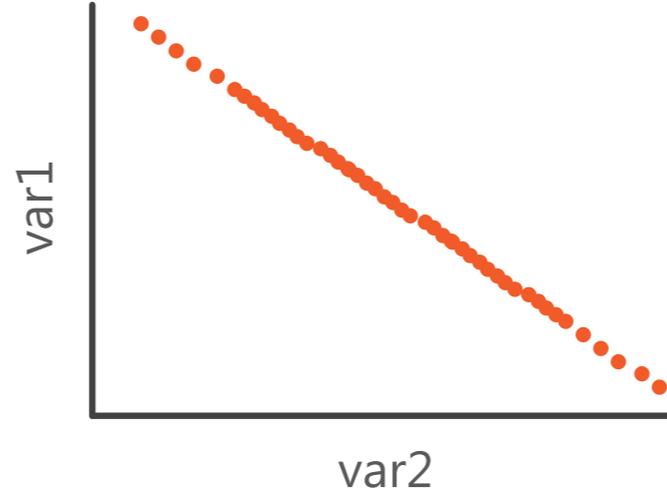

In the scatter plots here, it's easy to see **correlation** between downloads and uploads, but with the other dimensions that's difficult.

# Parallel Coordinate Plots

Department

11 Users

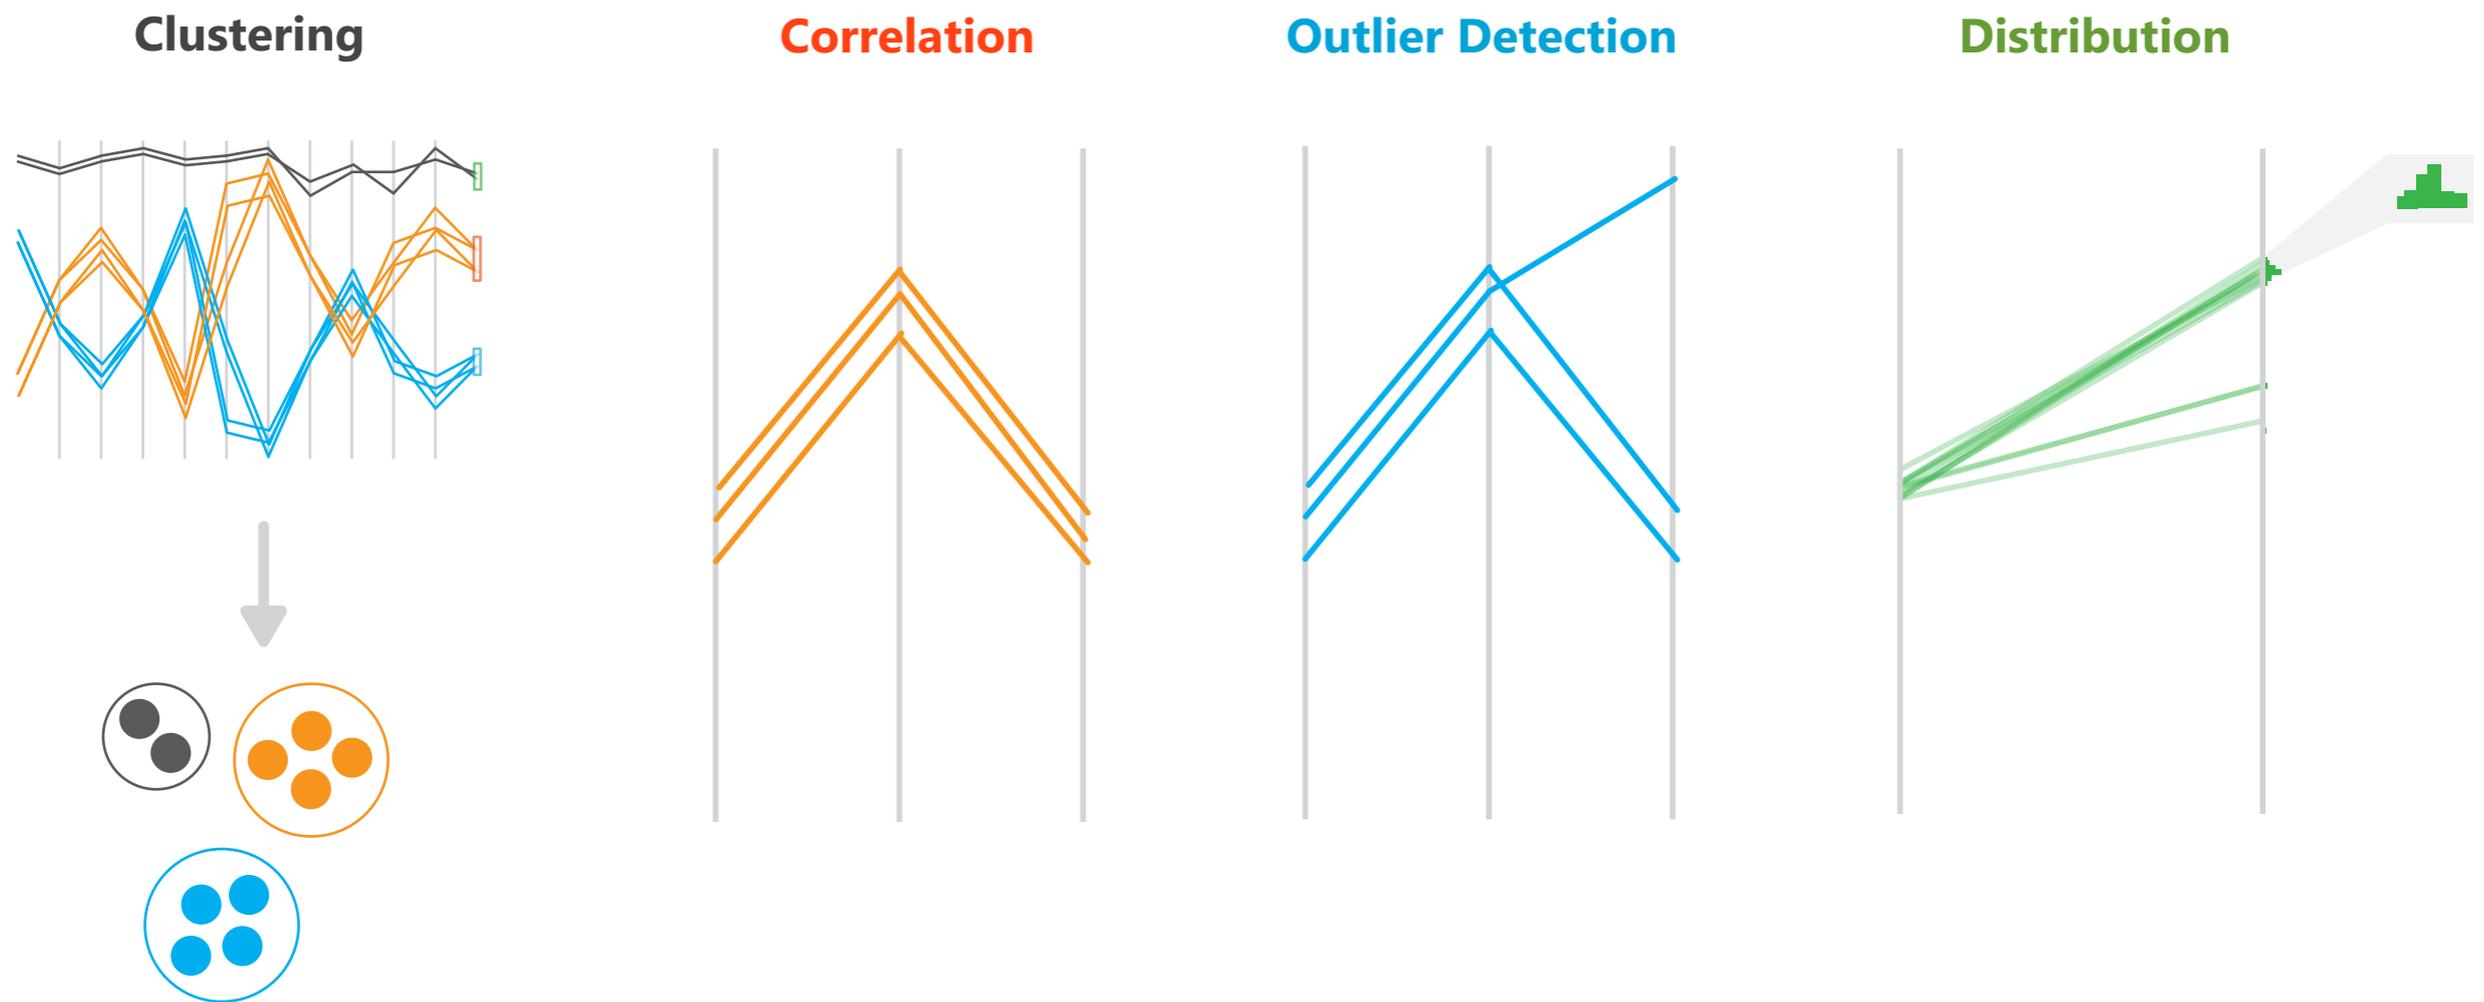

We use color for department since it's categorical information.

We can keep adding more parallel lines, and comfortably have around 20 dimensions for many users displayed at once.

# Parallel Coordinate Plots

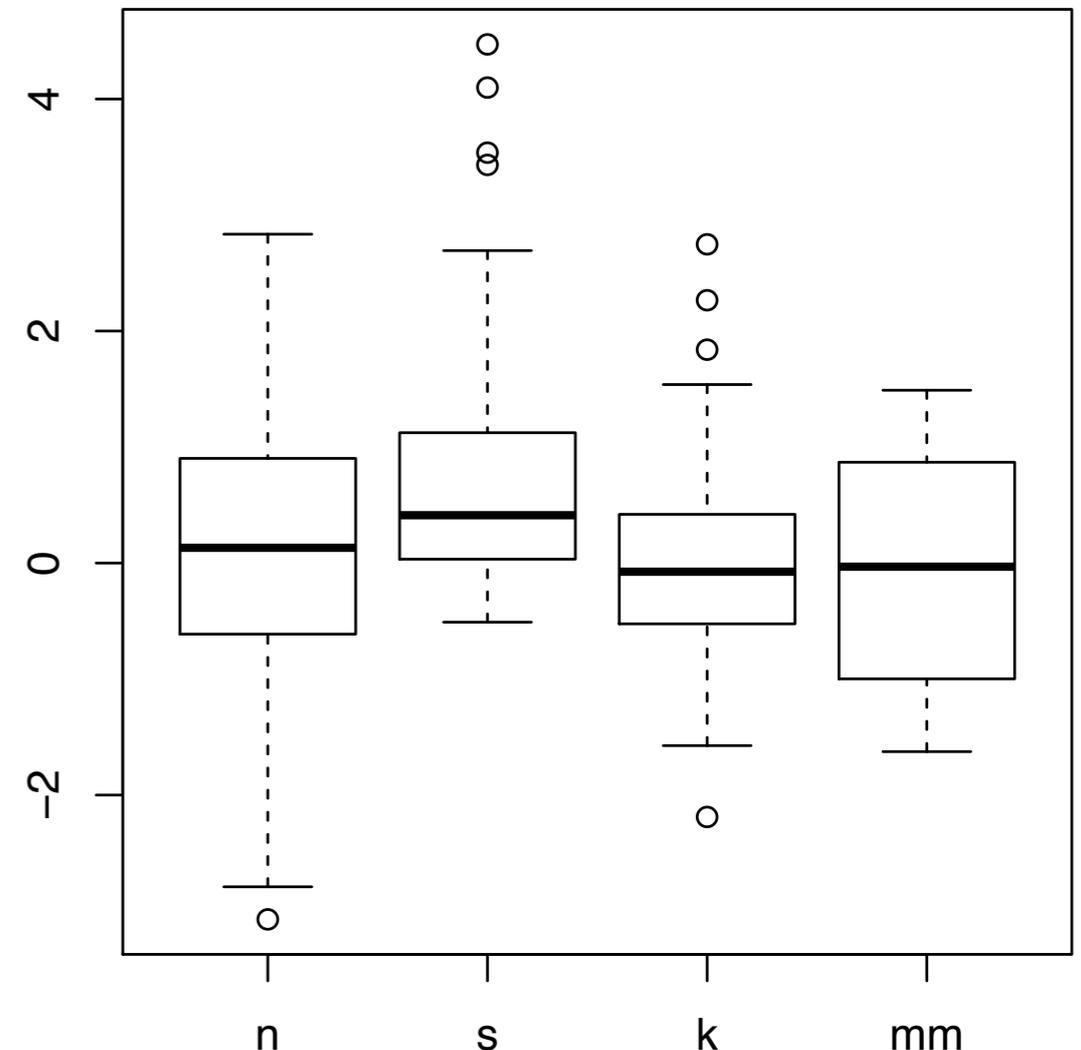

Parallel coordinates provide an efficient way to visualize many variables, along with their associated **clusters**, **anomalies**, value **distributions** and **correlations**.

# Multidimensional Visualization

## Glyphs

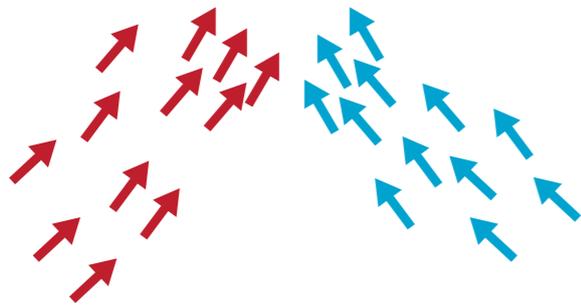

- static item aggregation
- **task:** find distribution
- **data:** table
- derived data
  - 4 quantitative attributes
    - median: central line
    - lower and upper quartile: boxes
    - lower upper fences: whiskers
  - outliers beyond fence cutoffs explicitly shown

# Multidimensional Visualization

## Glyphs

### Simple Glyph

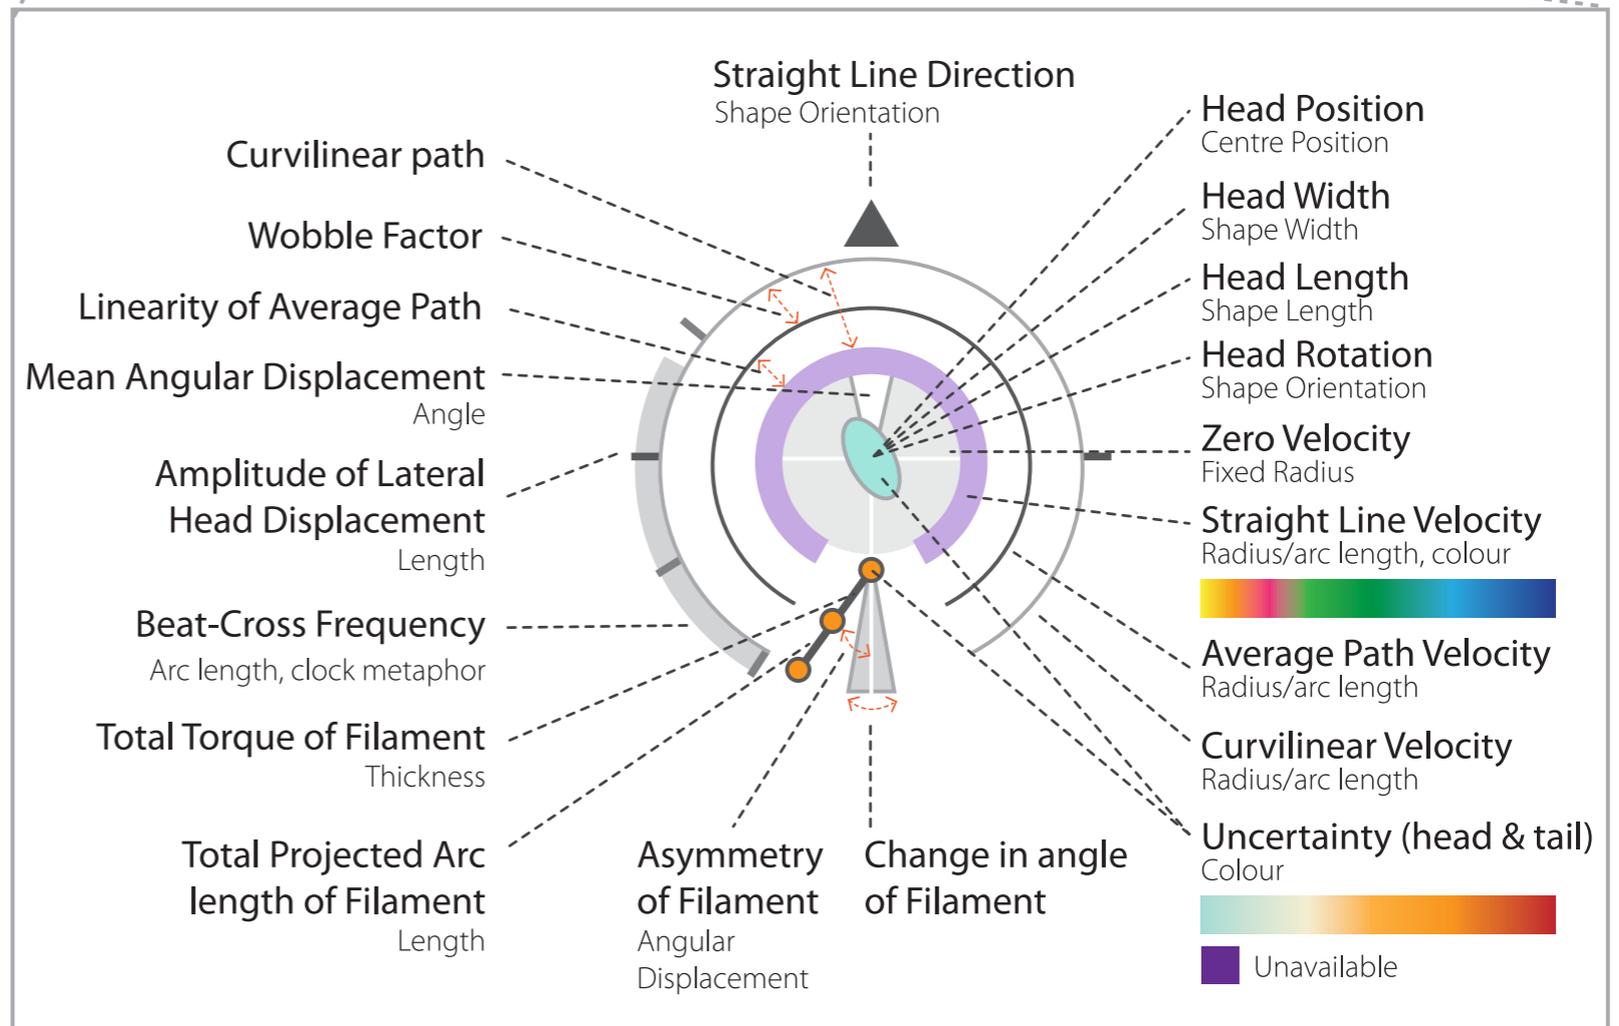

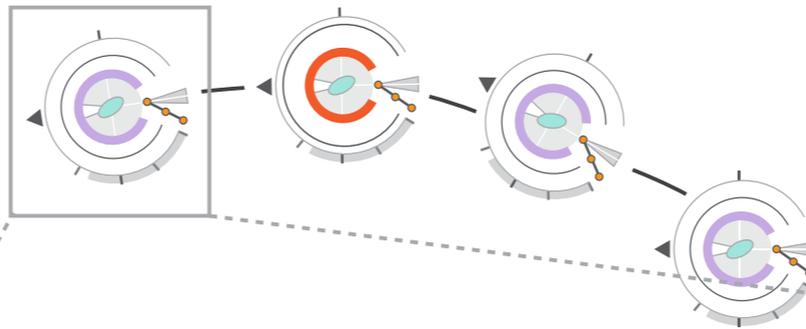

**Temperature - Colour** ■■■■

**Wind direction - Orientation** ↑ ↗ ↘ →

**Wind Speed - Proximity**

**Location - Position**

### Complex Glyph

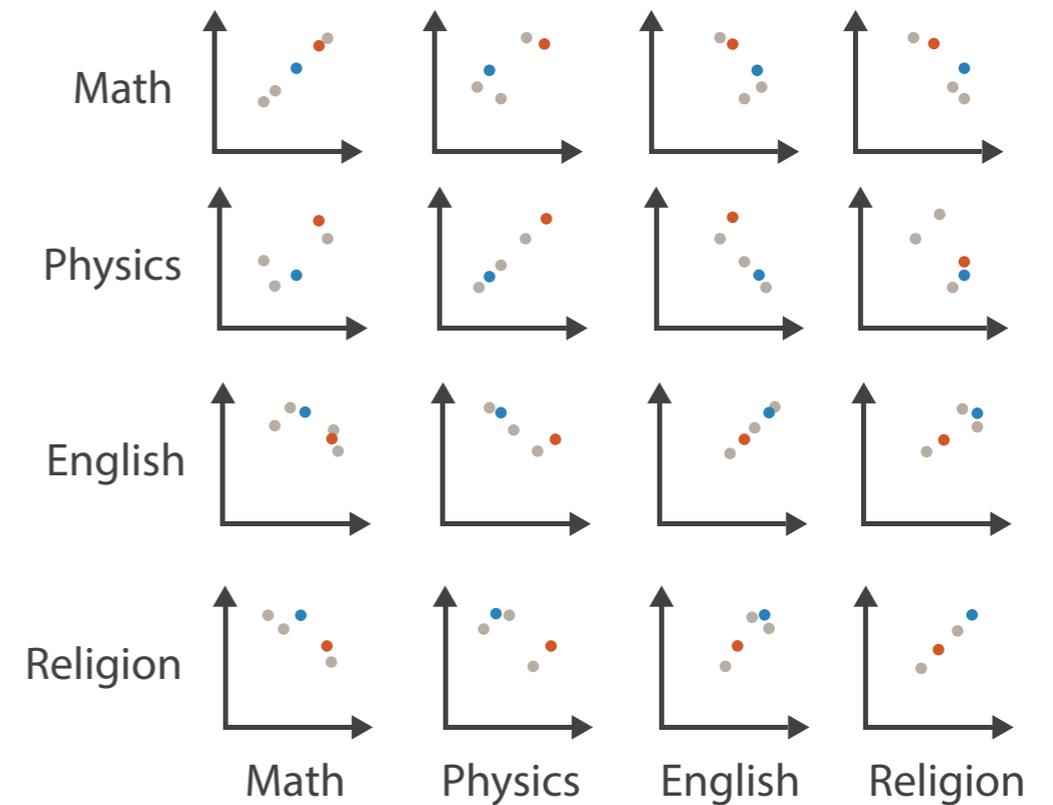

# Multidimensional Visualization

Dendrogram

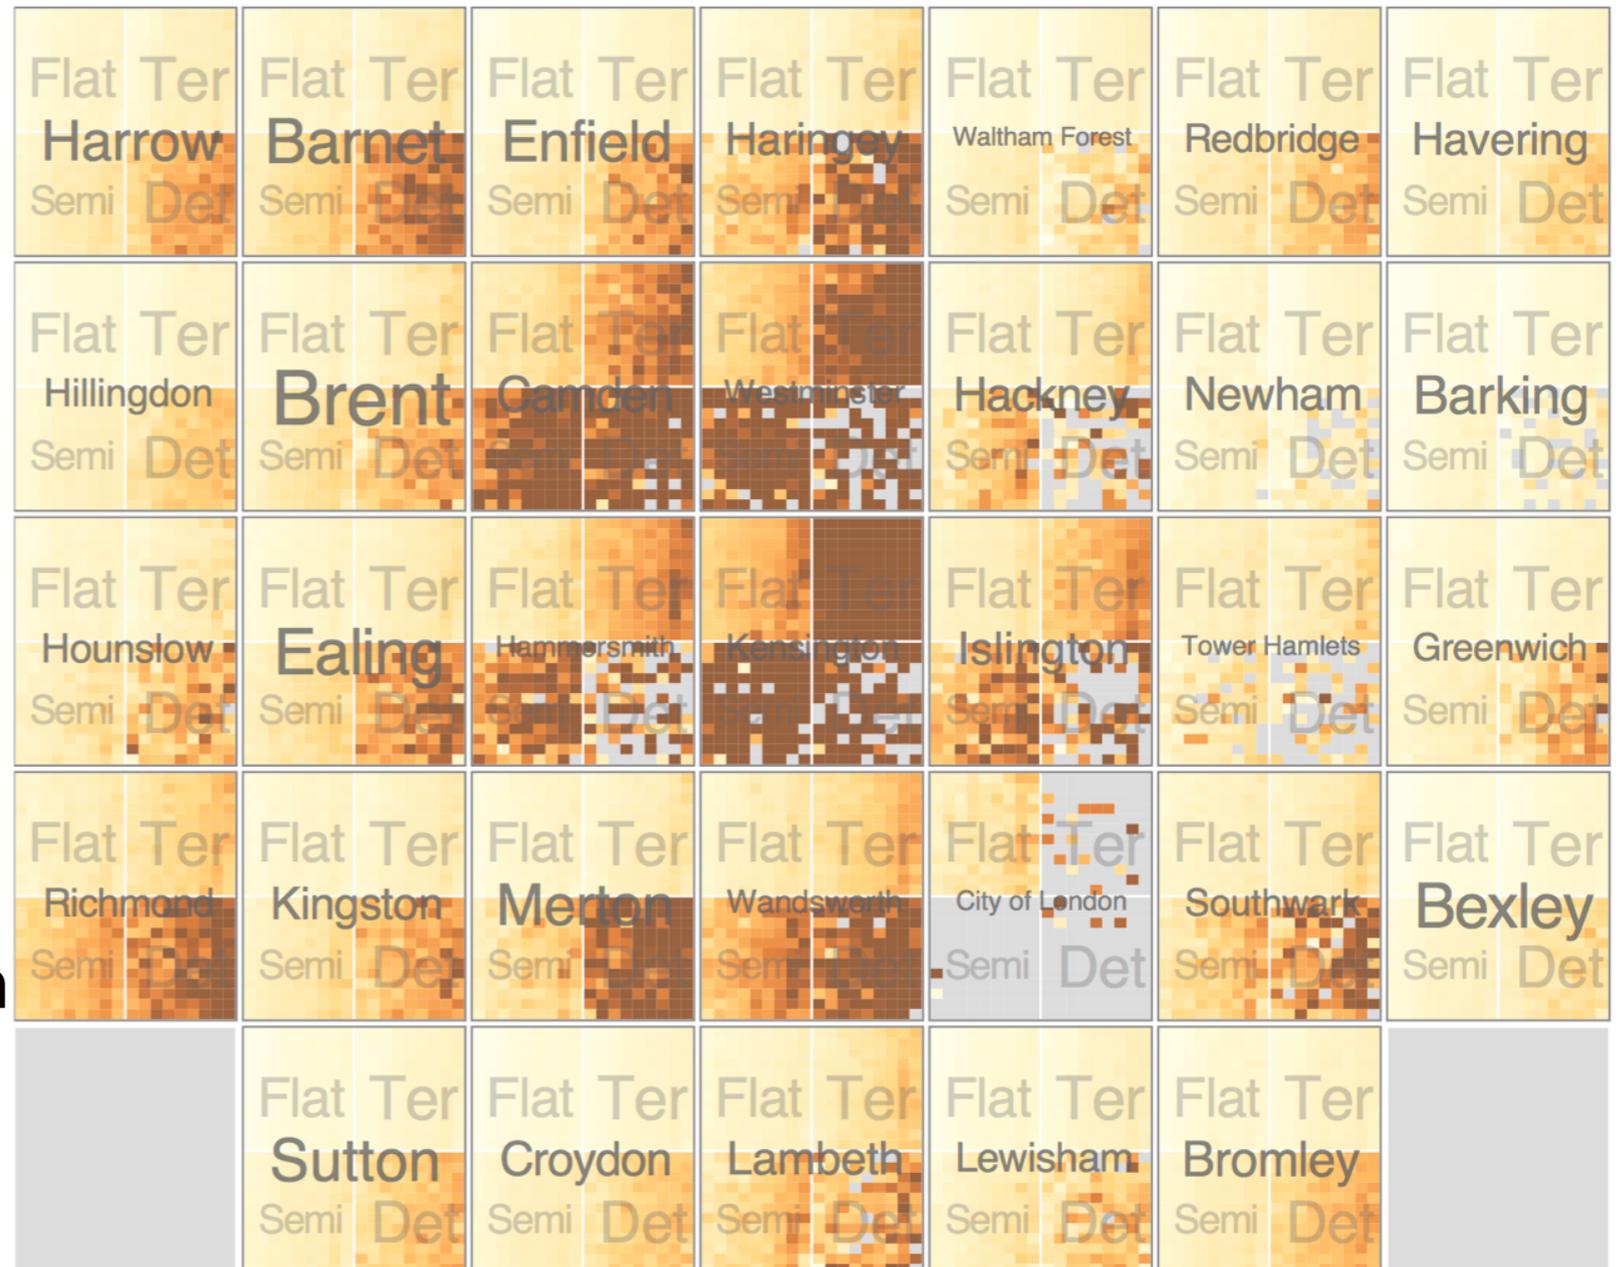

View as **treemap** ▼

# Treemaps Partitioning

- split by neighbourhood
- then by type
- colour by price
- neighbourhood patterns
  - where it's expensive
  - where you pay much more for detached type

# Treemaps Partitioning

- switch order of splits
  - type then neighbourhood
- switch colour
  - by price variation
- type patterns
  - within specific type, which neighbourhoods are inconsistent

# Validation & User Testing

# Validating your visualisation..

# Validating your visualisation...

## **Domain situation**

Observe target users using existing tools

## **Data/task abstraction**

 **Visual encoding/interaction idiom**  
Justify design with respect to alternatives

 **Algorithm**  
Measure system time/memory  
Analyze computational complexity

Analyze results qualitatively

Measure human time with lab experiment (*lab study*)

Observe target users after deployment (*field study*)

Measure adoption

# The elephant in the room... scaling up

“Visualization can surprise you, but doesn't scale well.  
Modelling scales well, but can't surprise you.”

Hadley Wickham

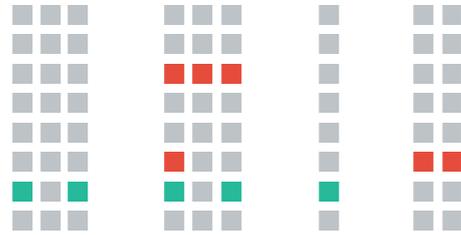

# The elephant in the room... scaling up

One of the biggest challenges in HEP, Biology, chemistry, and business is scale.

Our screens have a limited number of pixels. And our data is often much larger.

**You can do two things to get around this.**

# Solutions

## Reduce the problem space

Try and get users to focus queries as soon as possible to reduce the amount of data to be visualised.

Provide ways to aggregate information in to meaningful overview visualisations...

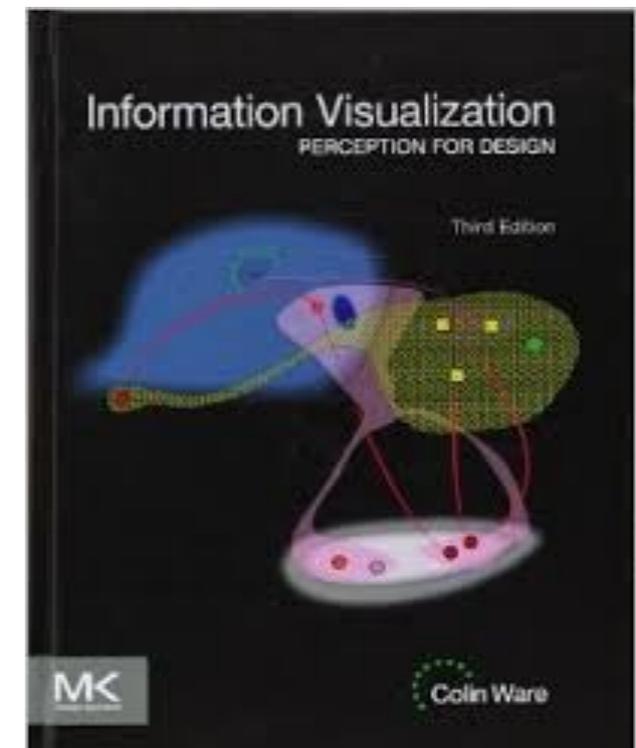

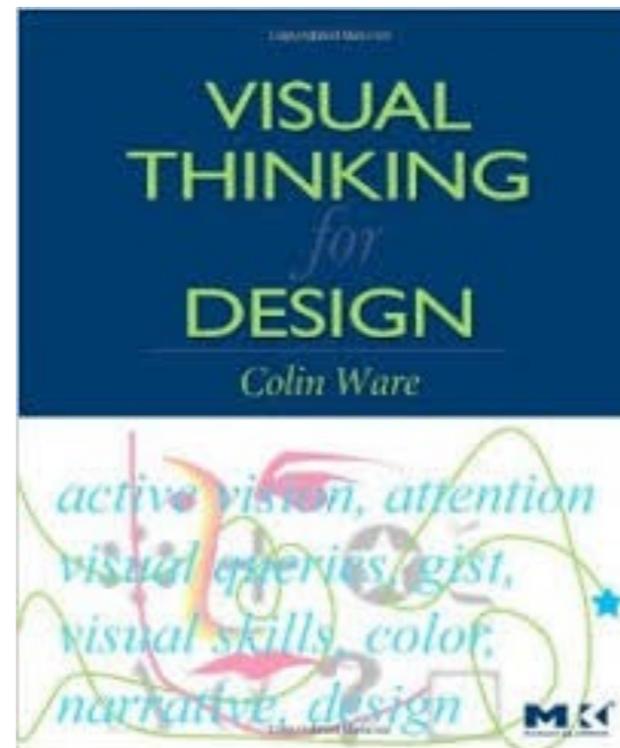

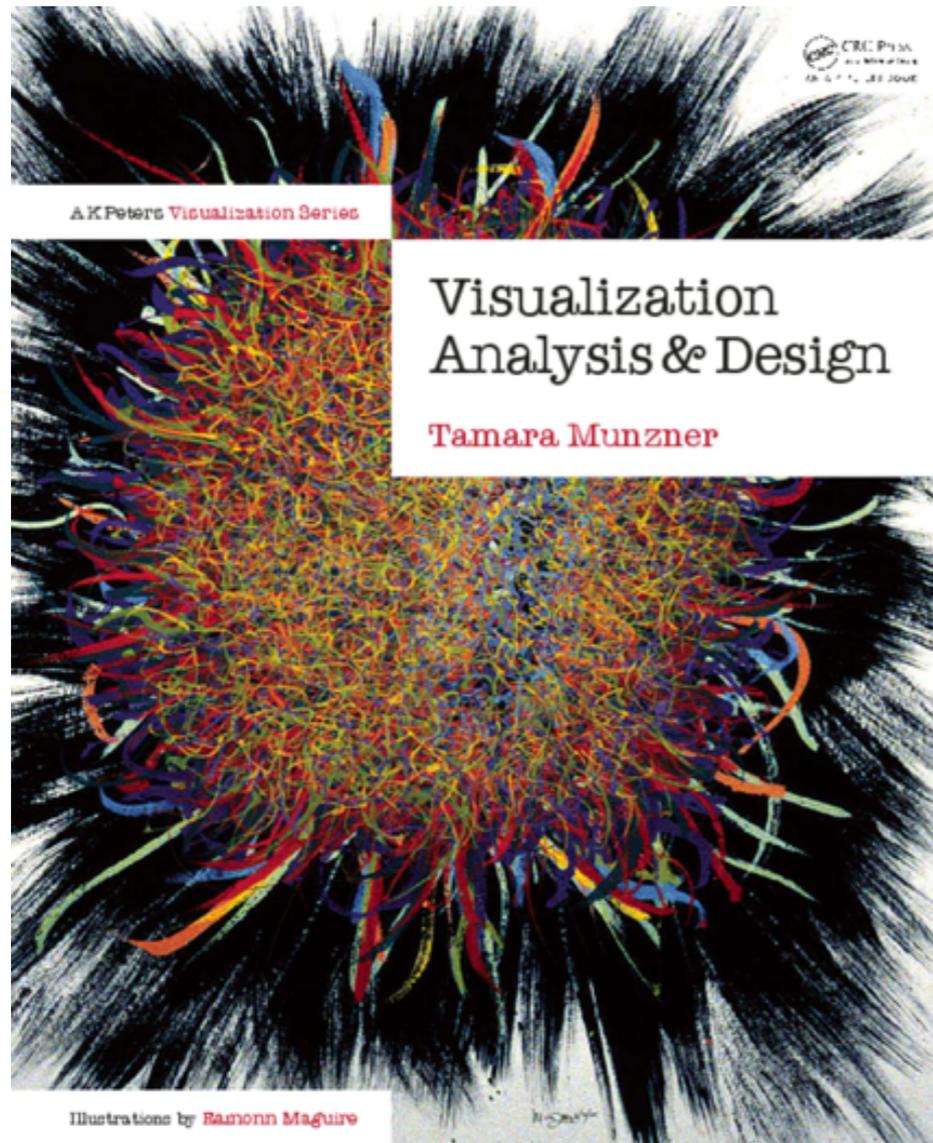

## GPU usage and WebGL

As done in imMens from Jeffrey Heer's lab in Washington. Renders billions of data points at 50 fps in the browser.

Not yet compatible across all browsers, and not everyone has a dedicated GPU.
