

# ***Charm, beauty and (a little on) top at the LHeC***

LHeC workshop, Divonne, 2 Sep 2009  
Olaf Behnke, DESY

- 
- Charm and beauty production in DIS (**RAPGAP**)
  - Beauty in Photoproduction (**PYTHIA**)
  - Total cross sections for charm, beauty and top production (**RAPGAP, PYTHIA, LEPTO**)

# Motivation

---

- Understand quark properties: **Top**
- Look for enhanced production due to new physics: **Top, Beauty**
- Tool for measuring proton **strange** density via  $sW \rightarrow c$ : **Charm**
- Tool for measuring proton gluon density: **F2cc, F2bb**
- To predict  $bb \rightarrow H$  and other b-initiated processes at LHC: **F2bb**

# F2bb one motivation: determine 'b-density' in proton

## LheC

## LhC

# Charm and beauty in DIS with RAPGAP31 MC

- Used steering:
- LO BGF + PS (ipro=14)
  - Used PDF: CTEQ5L
  - $mc=1.5$ ,  $mb=4.75$  GeV
  - $0.01 < y < 0.95$

Note: all MC predictions shown are on parton level

# Fiducial cuts

HERA :

- $pt_c > 1.5 \text{ GeV}$   
 $|\eta_c| < 1.5 \leftrightarrow 25 < \theta < 155$

LHeC :

- No cut scenario *"all inclusive"*
- $pt_c > 1.5 \text{ GeV}$ 
  - $|\eta_c| < 4 \leftrightarrow 2 < \theta < 178$
  - $|\eta_c| < 2.5 \leftrightarrow 10 < \theta < 170$
  - $|\eta_c| < 1.5 \leftrightarrow 25 < \theta < 155$

*$|\eta| < 4$  or at least  $|\eta| < 2.5$   
should be reachable*

# Energy, luminosity and tagging efficiencies

---

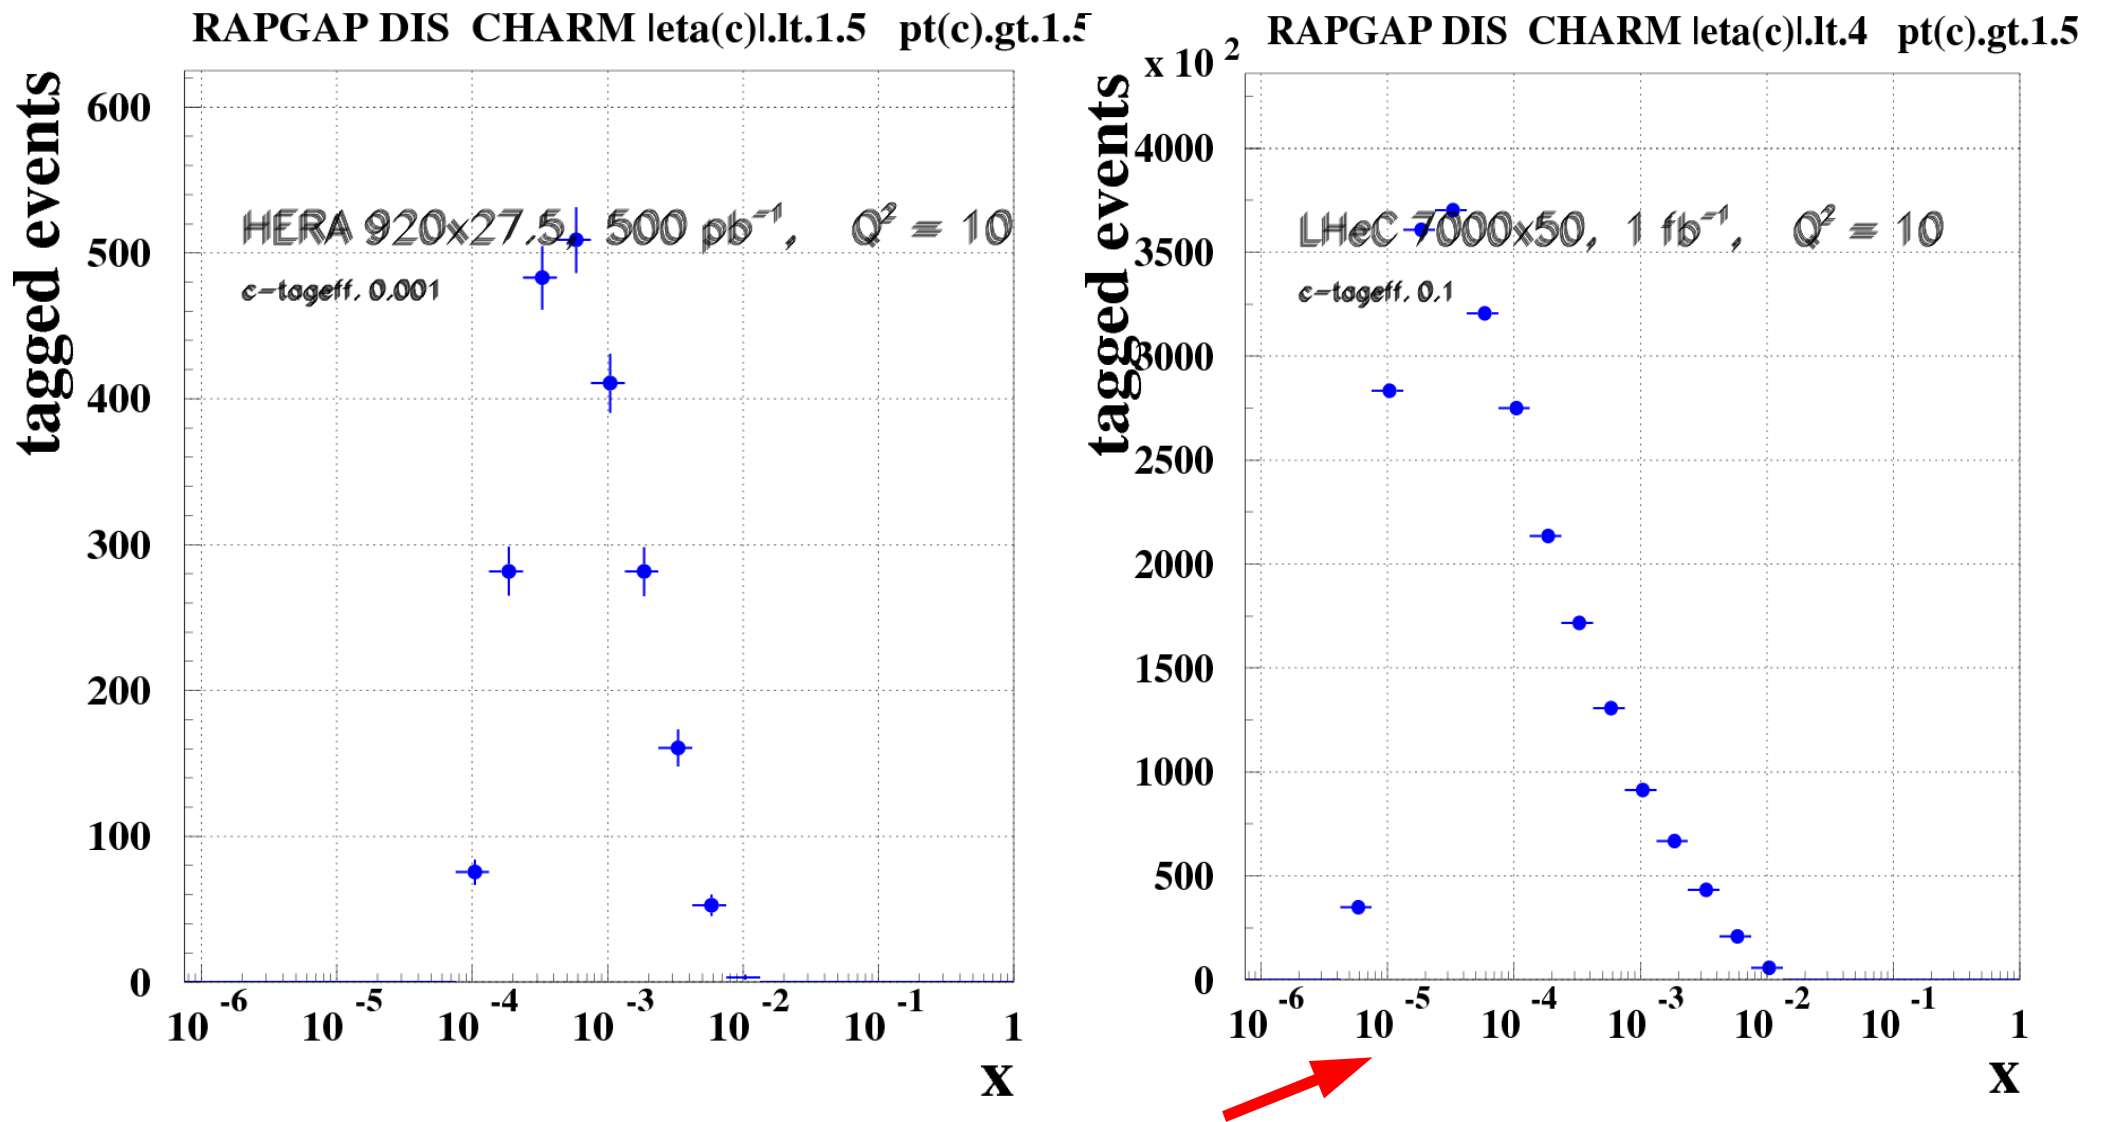

## HERA :

- $L = 500 \text{ pb}^{-1}$
- Effective tagging efficiencies (corresponding to background free events):
  - Charm: 0.001
  - Beauty: 0.01

## LHeC :

- Charm: scenario C, Ring Ring low x
  - 7000 GeV x 50 GeV
  - $L = 1 \text{ fb}^{-1}$
- Beauty: scenario D Linac Ring
  - 7000 GeV x 100 GeV
  - $L = 10 \text{ fb}^{-1}$
- Effective tagging efficiencies:
  - Charm: 0.1
  - Beauty: 0.1

# Expected tagged charm events (corresponding to background free #events)

→ LHeC extends to much smaller x values (as expected!)

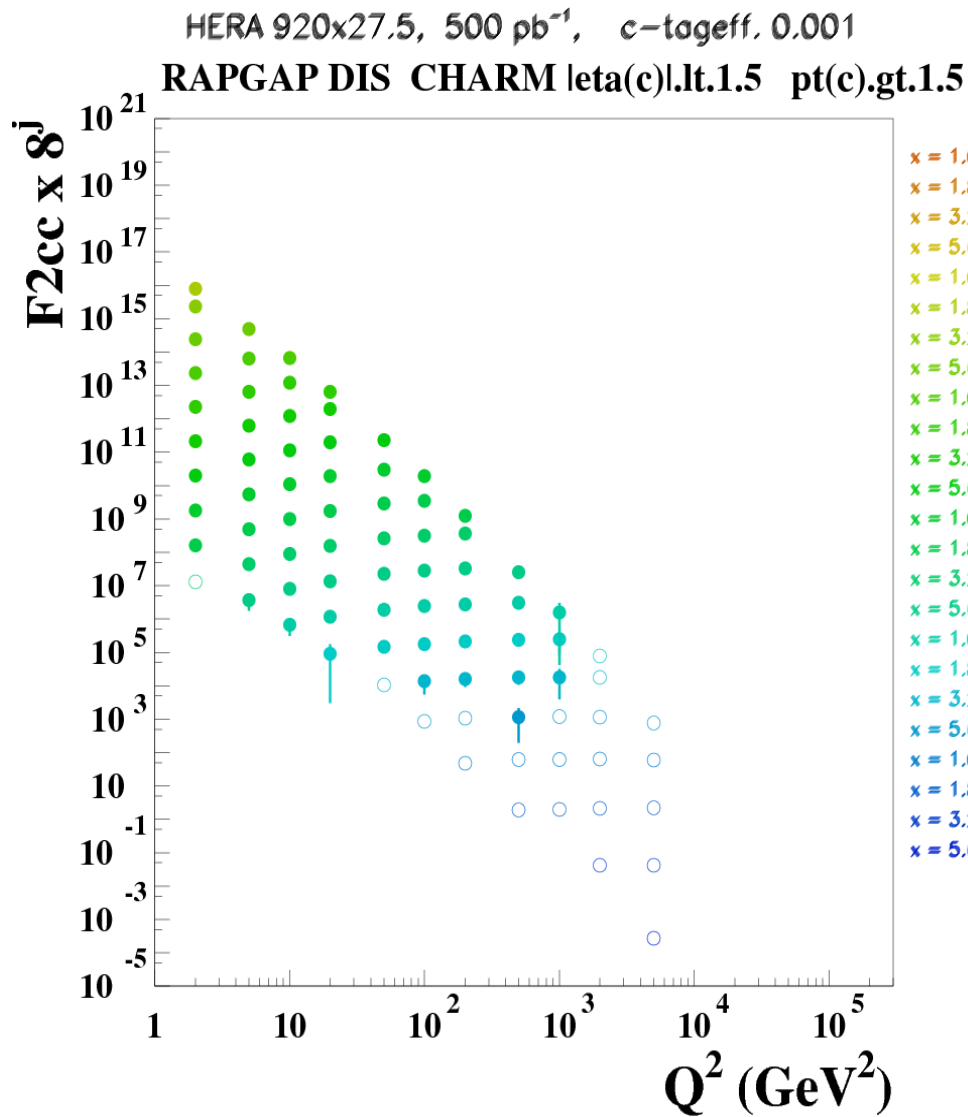

# Expected F2cc: LHeC vs HERA

→ Again:  
for same  $Q^2$   
LHeC extends to  
much lower  $x$

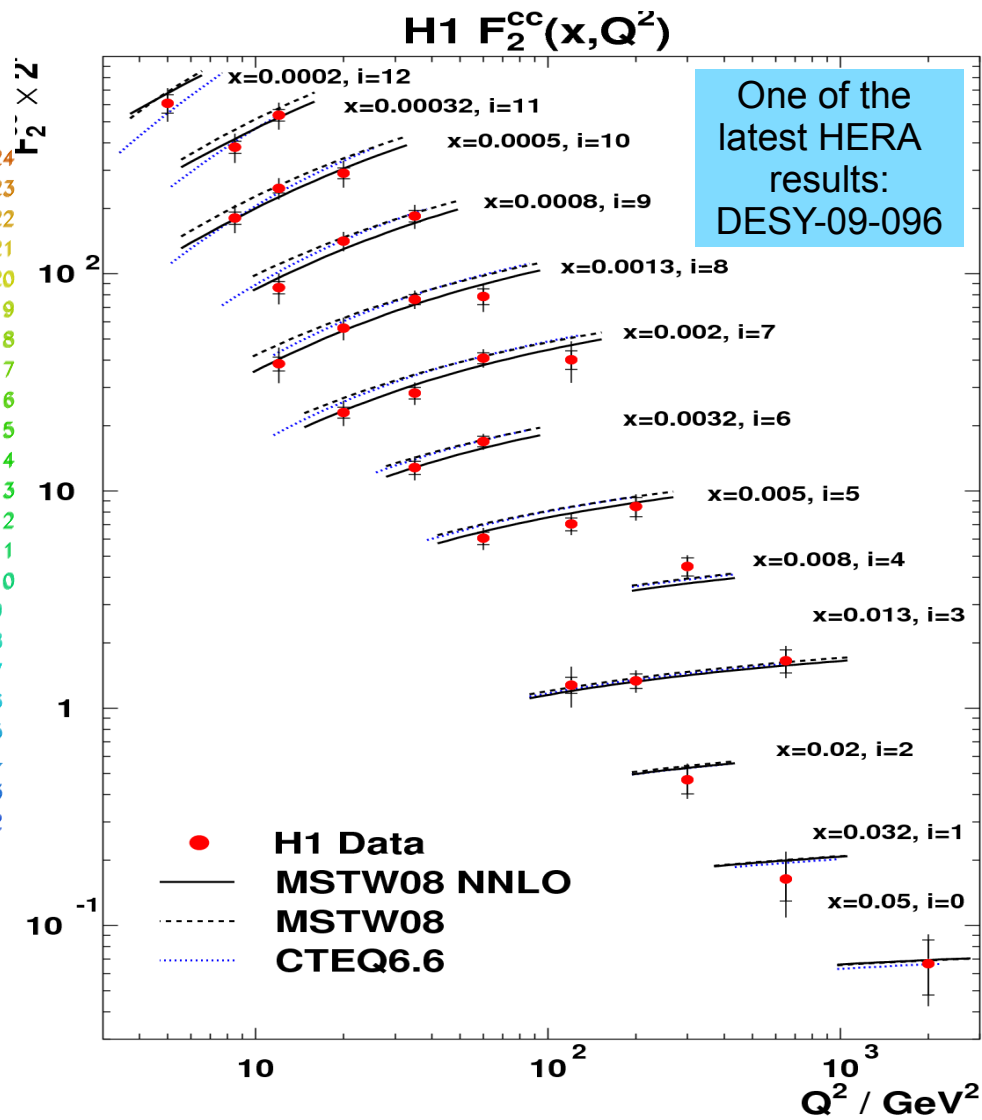

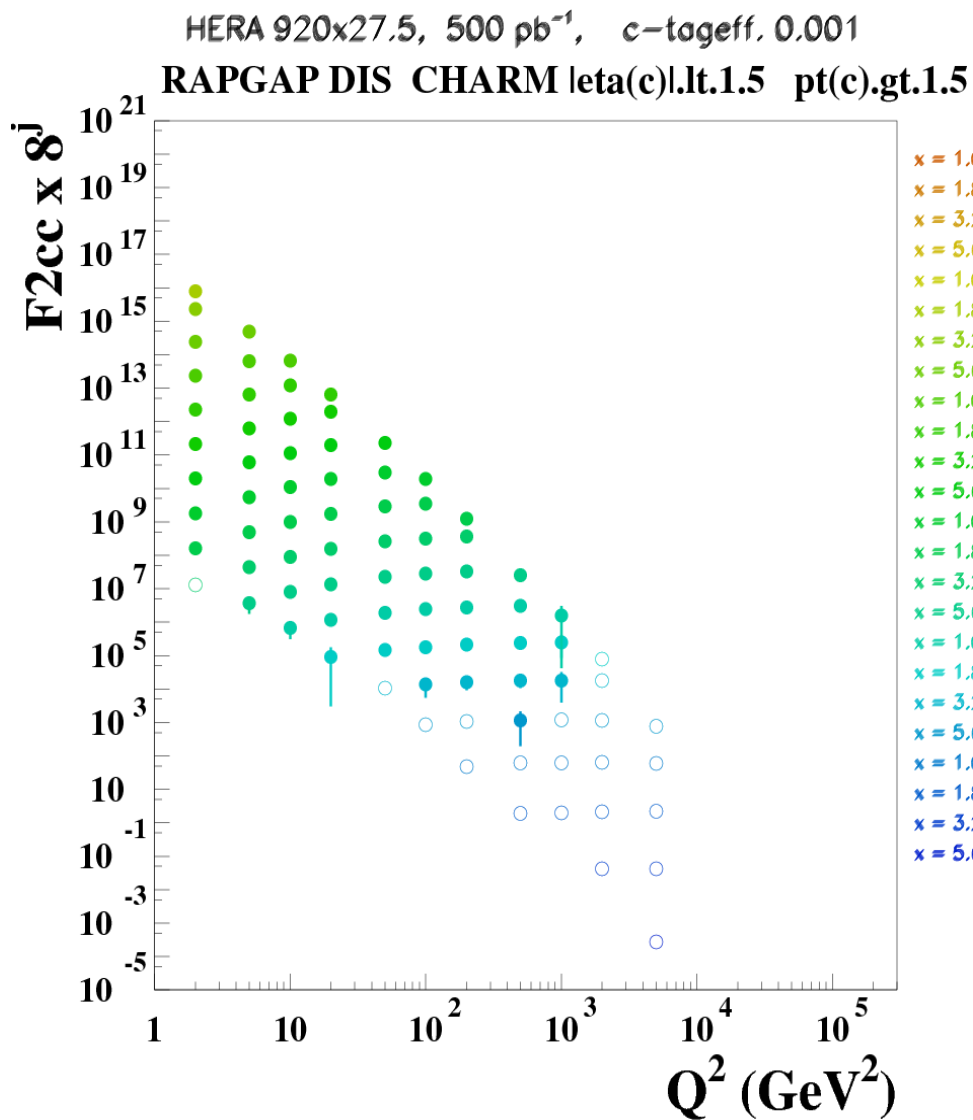

# F2cc: Can we 'reproduce' HERA with our simulation?

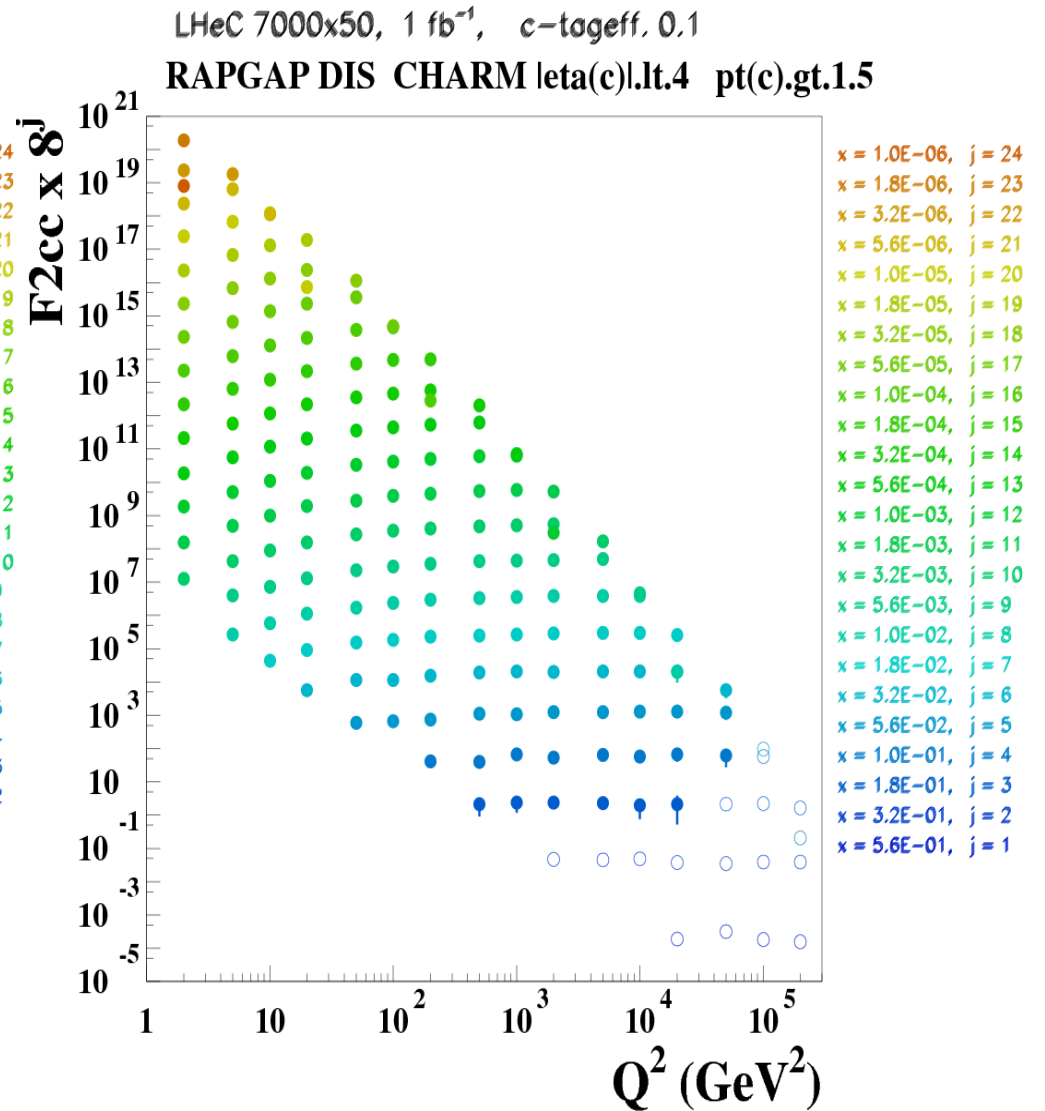

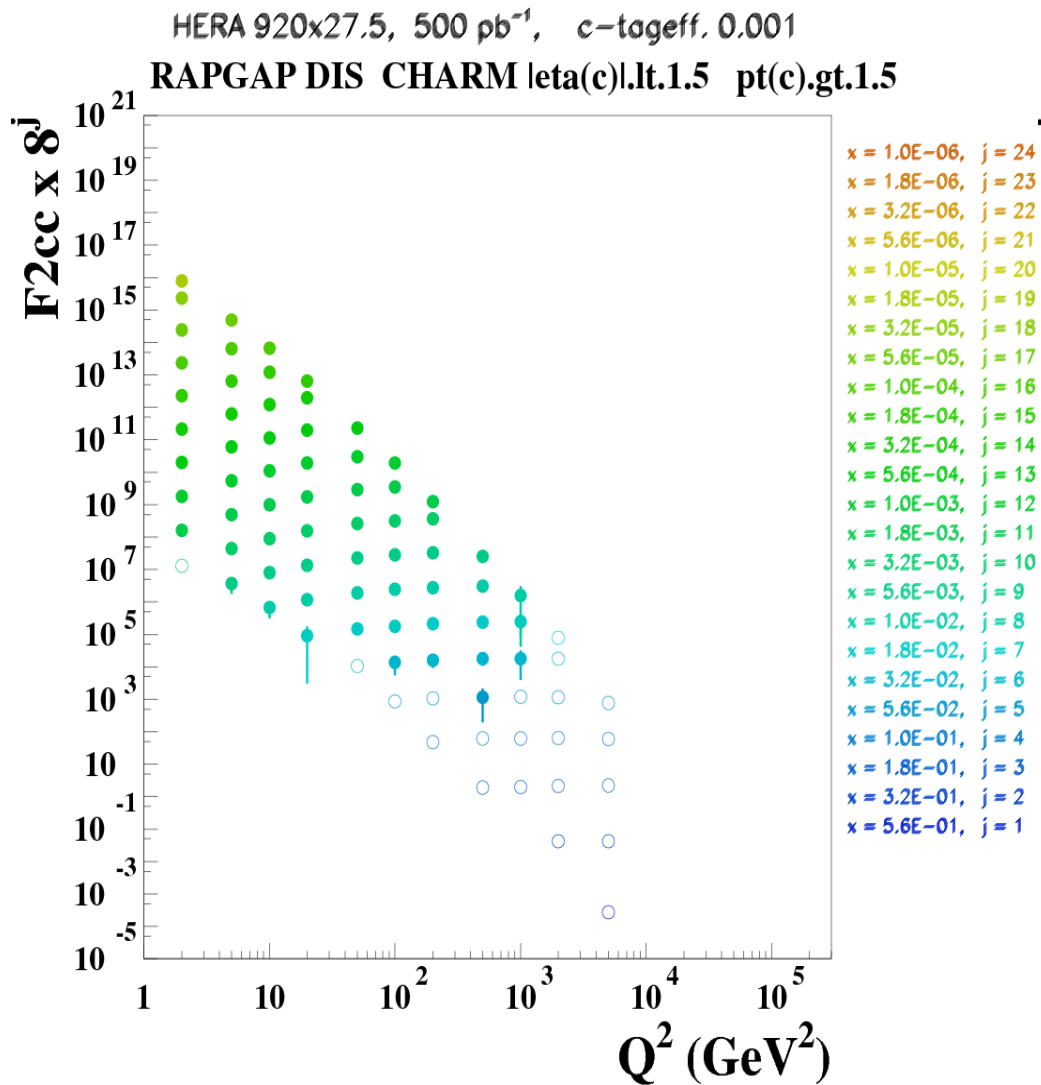

➔ Yes, at least roughly 😊

# F2cc: Can we 'reproduce' HERA with our simulation?

➔ Yes, at least roughly 😊

# F2cc: HERA vs LHeC

→ LheC increases visible phasespace to  $10^{-6} < x < 0.1$

**Next: check dependence of expected  
F2cc @LHeC on the detector polar  
angle acceptance**

$\Theta=25^\circ$   $\eta=1.5$

$\Theta=9.4^\circ$   $\eta=2.5$

$\Theta=2^\circ$   $\eta=4$

LHeC 7000x50, 1 fb<sup>-1</sup>, c-tageff, 0.1

RAPGAP DIS CHARM |eta(c)|.lt.1.5 pt(c).gt.1.5

F2cc: LHeC  
|eta\_c| < 1.5

LHeC 7000x50, 1 fb<sup>-1</sup>, c-tageff. 0.1

RAPGAP DIS CHARM |eta(c)|.lt.2.5 pt(c).gt.1.5

F2cc: LHeC  
|eta\_c| < 2.5

LHeC 7000x50, 1 fb<sup>-1</sup>, c-tageff. 0.1

RAPGAP DIS CHARM  $|\eta_c| < 4$   $pt(c) > 1.5$

F2cc: LHeC  
 $|\eta_c| < 4$

LHeC 7000x50, 1 fb<sup>-1</sup>, c-togeff. 0.1

RAPGAP DIS CHARM leta(c)|.lt.inf pt(c).gt.0

F2cc: LHeC  
no eta\_c cuts

→ Detector coverage down to  $\theta=1^\circ$  crucial for large x physics

LHeC 7000x50, 1000 fb<sup>-1</sup>, c-tageff, 0.1

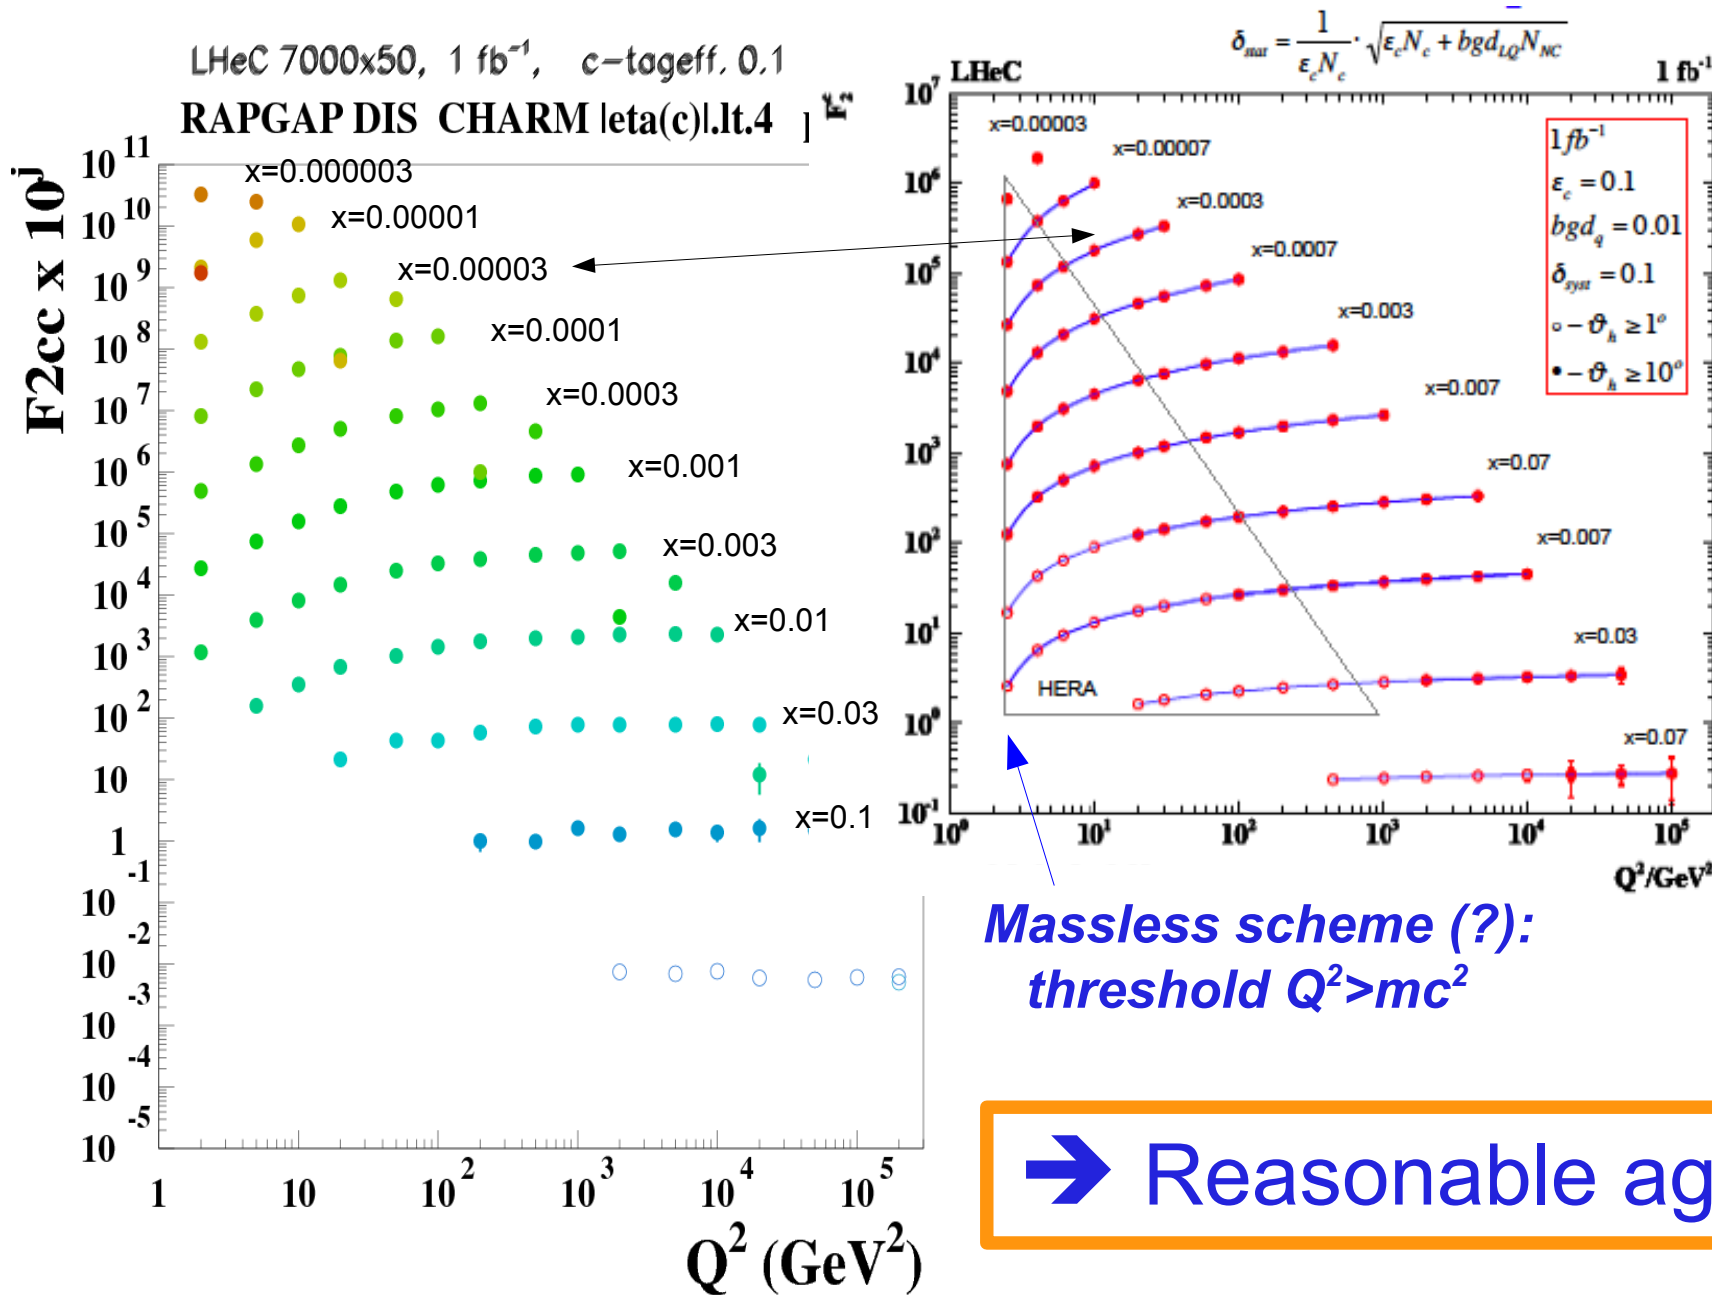

RAPGAP DIS CHARM  $\text{I}(\eta_c) < \text{I}(\eta_c)_{\text{inf}}$   $\text{pt}(c) > 0$

F2cc: LHeC  
no  $\eta_c$  cuts  
with 1000 fb<sup>-1</sup>

→ Detector coverage down to  $\theta=1^\circ$  crucial for large x physics

# F2cc: Comparing to Max and Andy's LHeC simulation

Max Klein,  
 Andy Mehta  
 LHeC 7000 x 70

# F2bb: Comparing to Max and Andys LHeC simulation

LHeC 7000x100, 10 fb<sup>-1</sup>, b-toeff. 0.1

RAPGAP DIS BEAUTY  $\eta(b)|_{lt.4}$   $pt(b).gt.1.5$

Max Klein, Andy Mehta

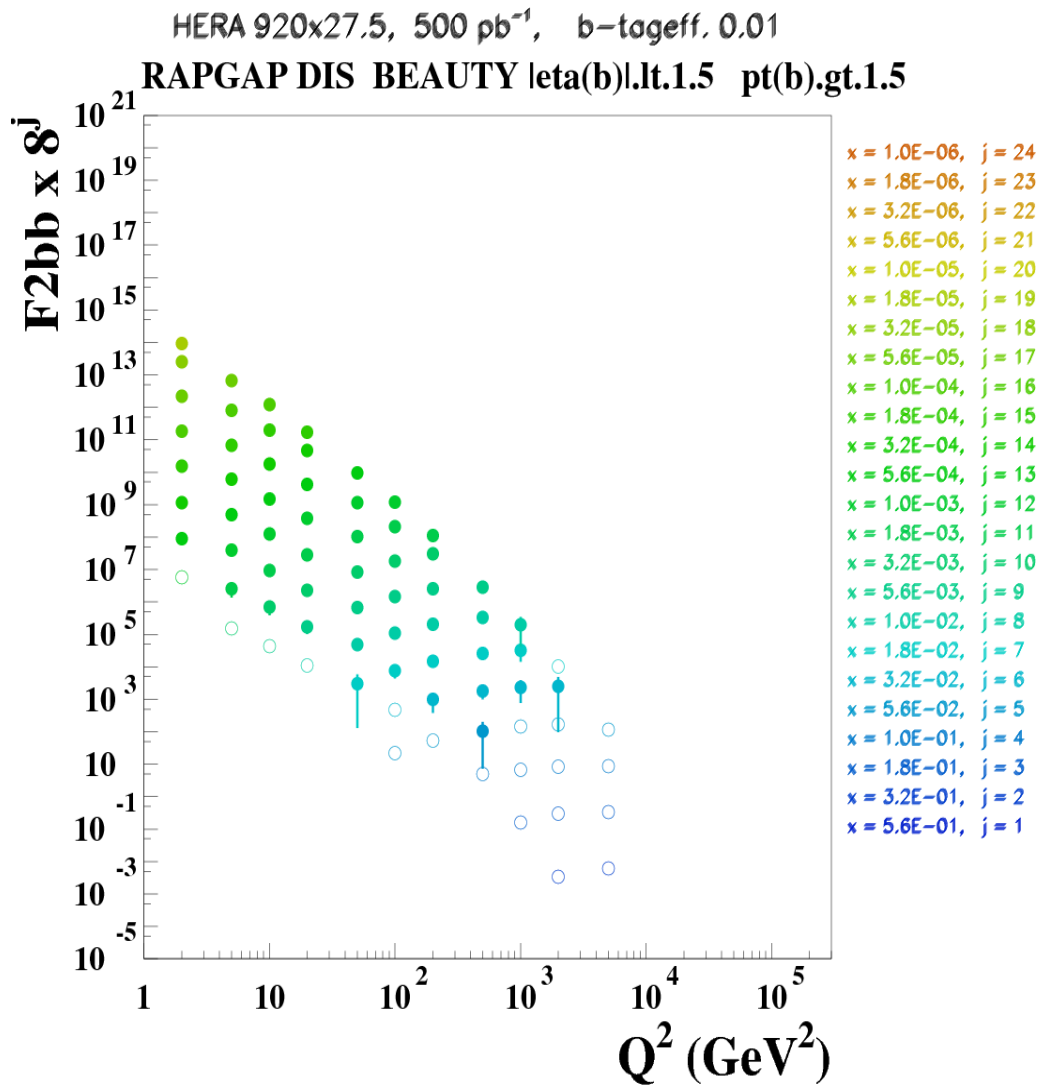

LHeC 7000 x 70

Threshold  $Q^2 > mb^2$

→ RAPGAP simulation in massive scheme extends to lower x and  $Q^2$

# F2bb: HERA vs LHeC

➔ Again: LHeC increases visible phasespace to  $10^{-6} < x < 0.1$

# Used tool for **Top**, **Beauty** and **Charm** photoproduction: PYTHIA 6.4

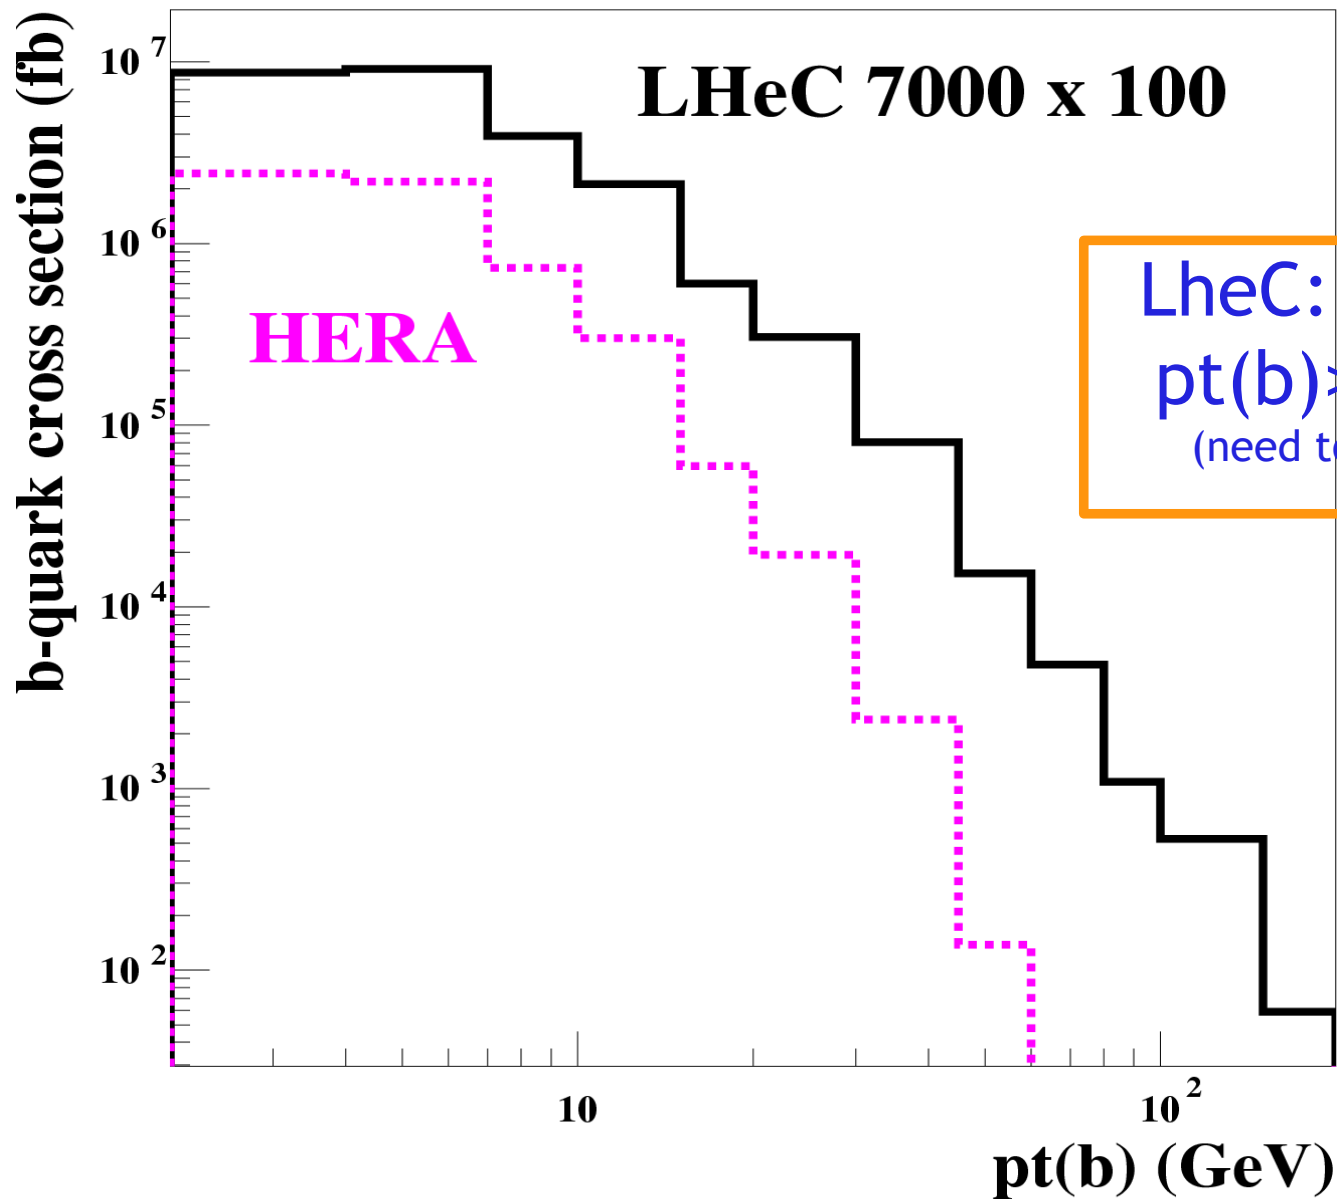

Used steering:

- LO BGF + PS (Proc 84)
- Used PDF: CTEQ6L
- $m_c=1.5, m_b=4.75$  GeV
- $0.1 < y < 0.9$

# Beauty $\gamma p$ : LHeC vs HERA

Pythia beauty  $\gamma p$  (proc 84) y.gt.0.1

LHeC: ~1000 b-events for  
 $pt(b) > 100$  GeV per  $1\text{fb}^{-1}$   
(need to multiply with tagging eff.)

# Used tool for **incl cc, sW** $\rightarrow$ **c** and **bw** $\rightarrow$ **t**: Lepto6.5 MC

---

## Used steering:

- Lepto CC mode
- QCD 'switched off'
- Used PDF: CTEQ5L
- For top:  $m_{\text{top}}=170$  GeV,  $y>0.1$

# LHeC total cross sections (MC simulated)

Total LHeC cross sections  
vs  $E_{lep}$   
( $E_p=7$  TeV)

# Conclusions

---

## **Assuming LHeC 7 TeV x 50-100 GeV with $L \sim 1-10 \text{ fb}^{-1}$ :**

- ✓ Expect factor  $\sigma(100-1000)$  larger tagged charm and beauty samples compared to HERA, requires c and b tagging efficiencies  $\geq 10\%$
- ✓ F2cc and F2bb: LHeC extends coverage down to  $x=10^{-6}$ , while  $x>0.1$  will be (again) difficult, polar angle acceptance  $<10^\circ$  crucial
- ✓ Single top cross-section bW  $\rightarrow$  t of order 5-10 pb (but Lepto inappropriate (?) since probably doesn't have correct matrix elements (quote Hubert Spiesberger))
- ✓ Total cross section for sW  $\rightarrow$  c of order 40 pb
- ✓ Future: c and b studies – not only on parton level but also including final state particles (e.g.  $b \rightarrow \mu X$ ) and their detector acceptance
- ✓ ***More detailed comparison of physics potentials and complementarity to LHC/ILC prospects would be nice, e.g. comparing impact on proton effective beauty density from: F2bb at LHeC vs Z+b production at LHC***

# Backup slides

Lets have some fun !

## To obtain errors on $F2_{cc}$

Calculate expected number  $N$  of charm tagged events in bins of  $Q^2$  and  $x$

$$N = L * \Delta\sigma * \mathbf{t_{ageff}}$$

- $\Delta\sigma$  is charm cross section obtained from RAPGAP
- Assumed effective tagging efficiency is product of branching ratios (e.g.  $c \rightarrow D^*$ ), acceptances, and takes background contamination into account
- Obtain fractional error on  $F2_{cc}$  from  $1/\sqrt{N}$

# Simulation results $F_{2c}$ : LHeC vs HERA

→ For same  $Q^2$   
LHeC extends to  
much lower  $x$

# Simulation results $F_{2cc}$ : LHeC vs HERA

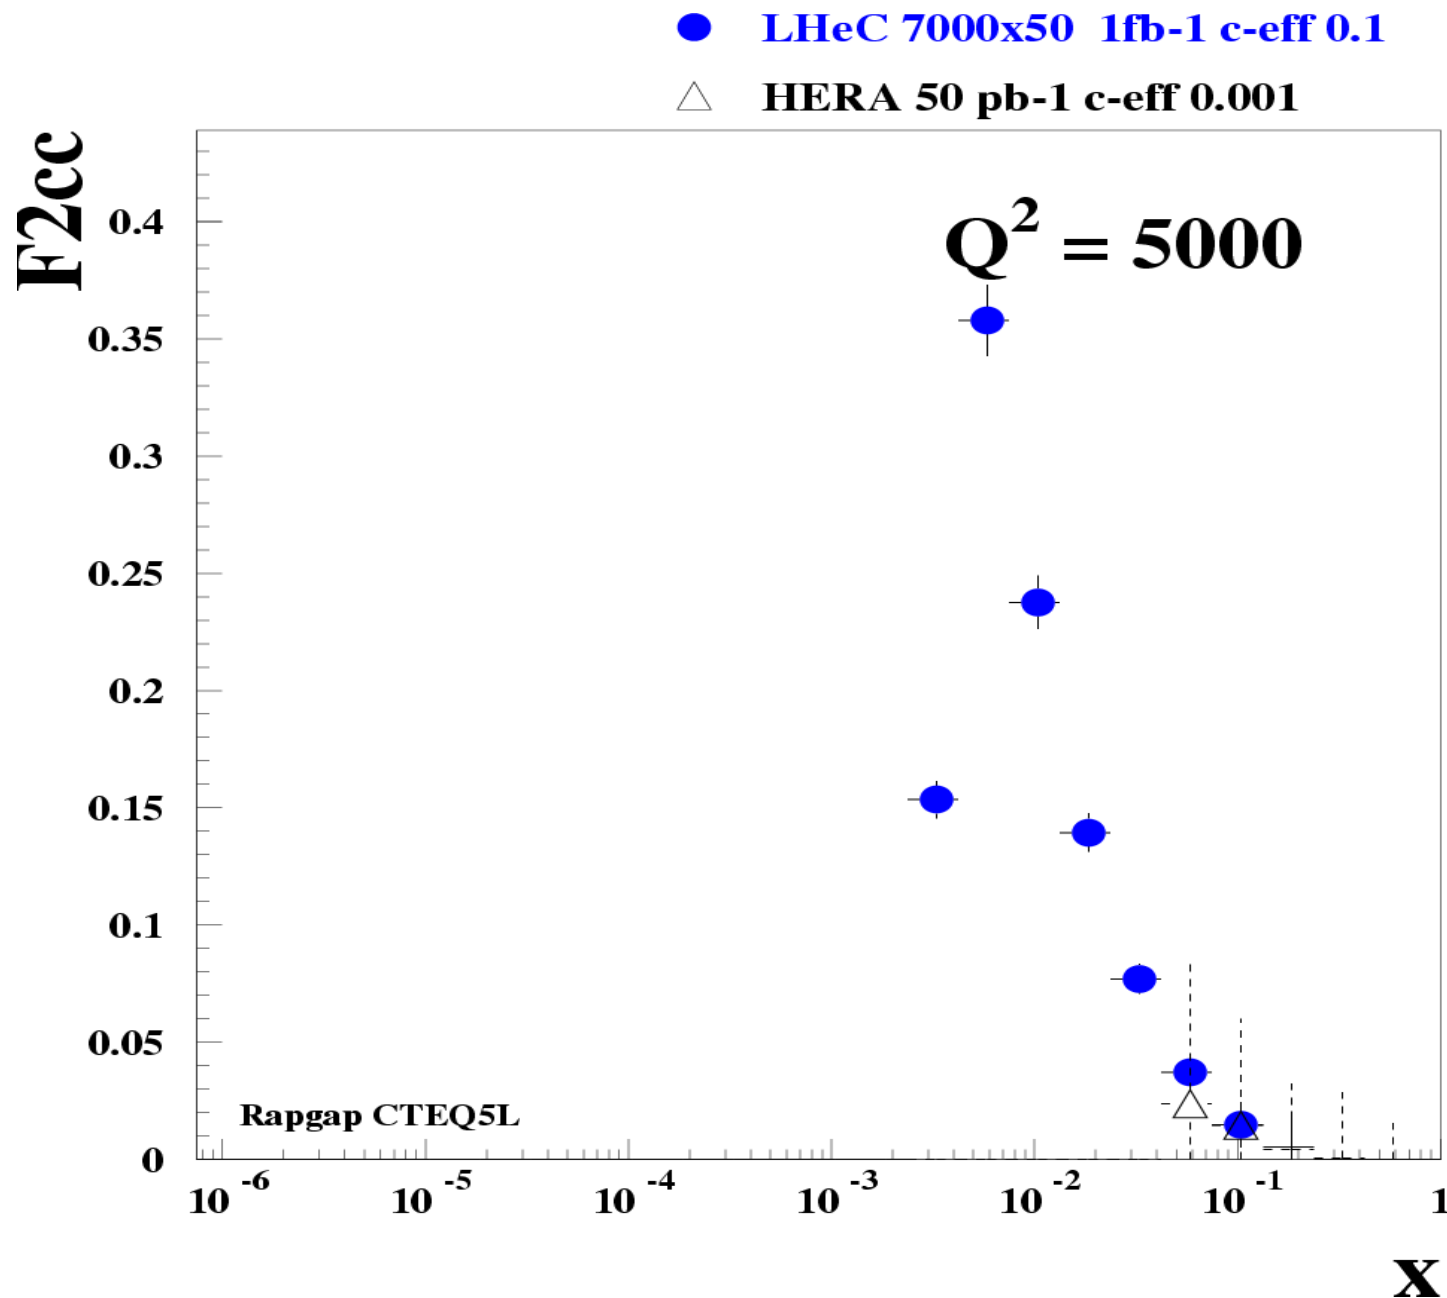

→ For same  $Q^2$   
LHeC extends to  
much lower  $x$

# Simulation results $F_{2cc}$ : LHeC vs HERA

→ For same  $Q^2$   
LHeC extends to  
much lower  $x$

# Simulation results **F2cc**: LHeC vs HERA

→ No HERA here  
(almost)

# Simulation results **F2cc**: LHeC vs HERA

● LHeC 7000x50 1fb-1 c-eff 0.1

➔ Up to where we go...

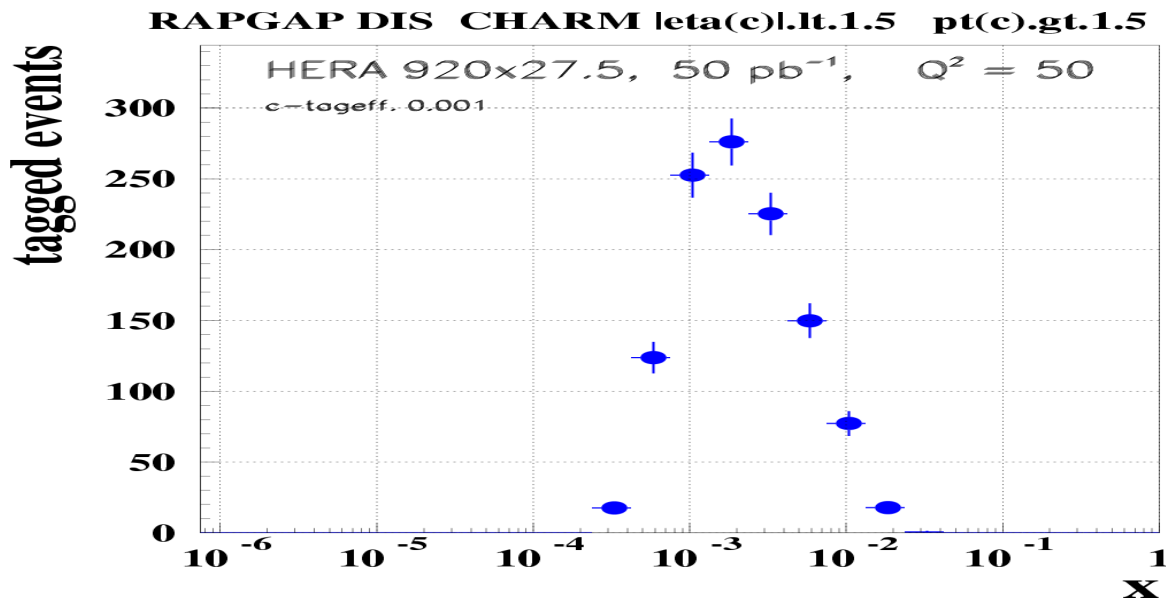

# Simulation results $F_{2cc}$ : LHeC vs HERA

● LHeC 7000x50 1fb-1 c-eff 0.1

→ NO, that's too far, sorry

# #charm tagged events for same x: LheC vs HERA

LheC/HERA rate factor  
~100 from:  
20 x lumi, 100 x tageff  
higher gluon density  
1/Q<sup>4</sup> suppression

# Charm: improvement with forward tagging

7 TeV x 70 GeV  
simulation

## LHeC $|\eta_c| < 1.5$

## LHeC $|\eta_c| < 4$

→ Intrinsic charm ( $x > \sim 0.1$ ) will be difficult (again)

# F2bb one motivation: determine 'b-density' in proton
