SYSTEM TESTING SERVICE DEVELOPMENTS USING

EOS + CTA USE CASE

DATA ARCHIVING AT CERN EVOLUTION

- EOS + tapes...
 - EOS is CERN strategic storage platform
 - tape is the strategic long term archive medium
- EOS + tapes =
 - You just met CTA: CERN Tape Archive

CTA + EOS DEVELOPMENTS Tightly coupled software \Rightarrow tightly coupled

developments

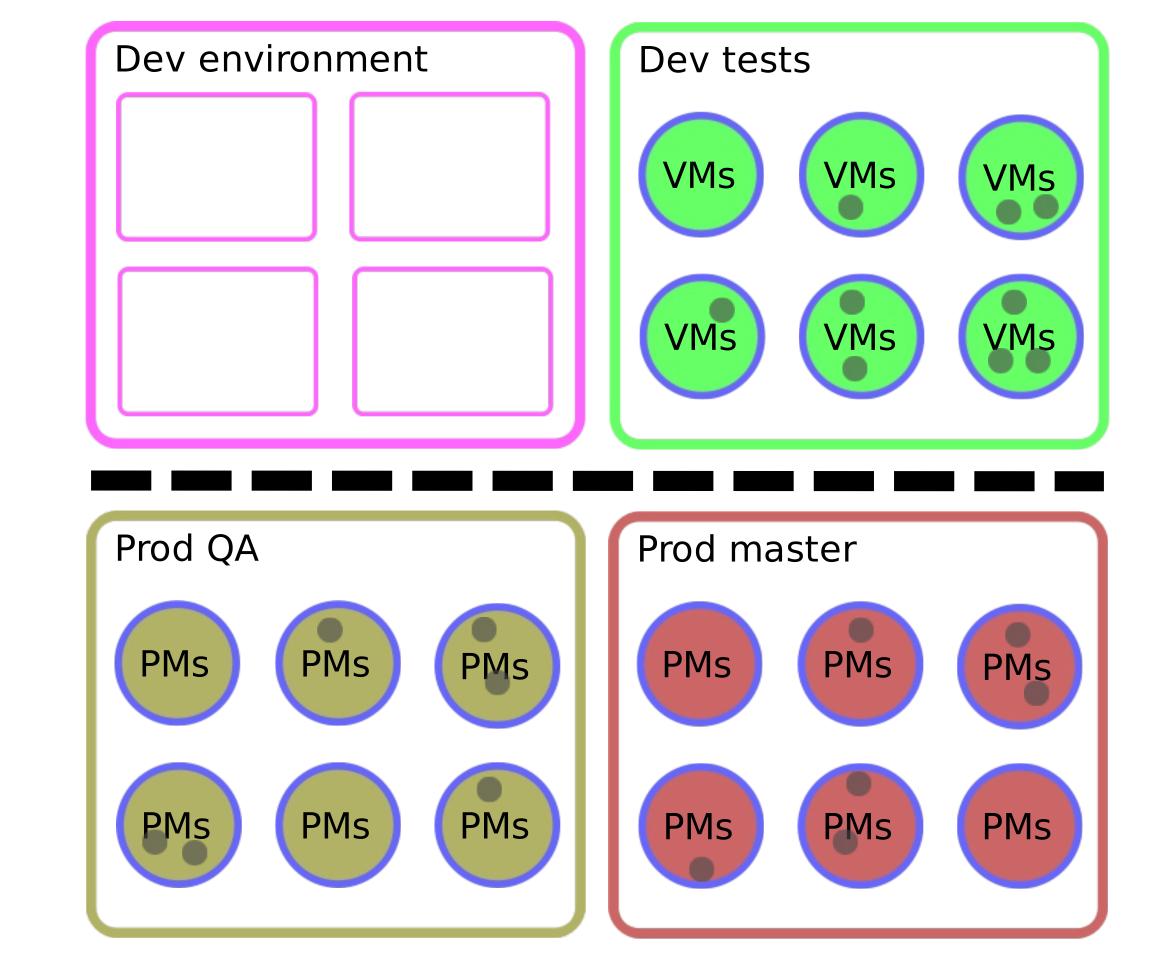

Extensive and systematic testing is paramount to limit regressions

CASTOR INTEGRATION TEST

- Easy situation:
 - all components are within one git repository
 - Puppet deploys development instances on VMs
 - Limited external dependencies per instance: 1 database, 1 virtual tape library

CASTOR INTEGRATION TESTS

- But several issues with VM/Puppet approach:
 - deploying a developer instance from scratch takes looonnng time...
 - code changes in CASTOR often require Puppet manifest change
 - real tape hardware tests are way further down the road in separate hostgroups, environments... • which implies ad hoc developer tests...

CTA+EOS INTEGRATION TESTS

- Complex situation:
 - 2 distinct software projects
 - More external dependencies per instance: 1 database, 1 virtual tape library, 1 objectstore

CTA+EOS INTEGRATION TESTS

- How to fix everything?
 - I am lazy and impatient
 - \circ no manual operation \rightarrow Cl
 - make it fast
 - Must allow similarly easy beta testing deployments for administrators/users (simple and bulletproof)
 - Must allow tests on real tape hardware.

CTA CI

Implemented in CERN Gitlab instance

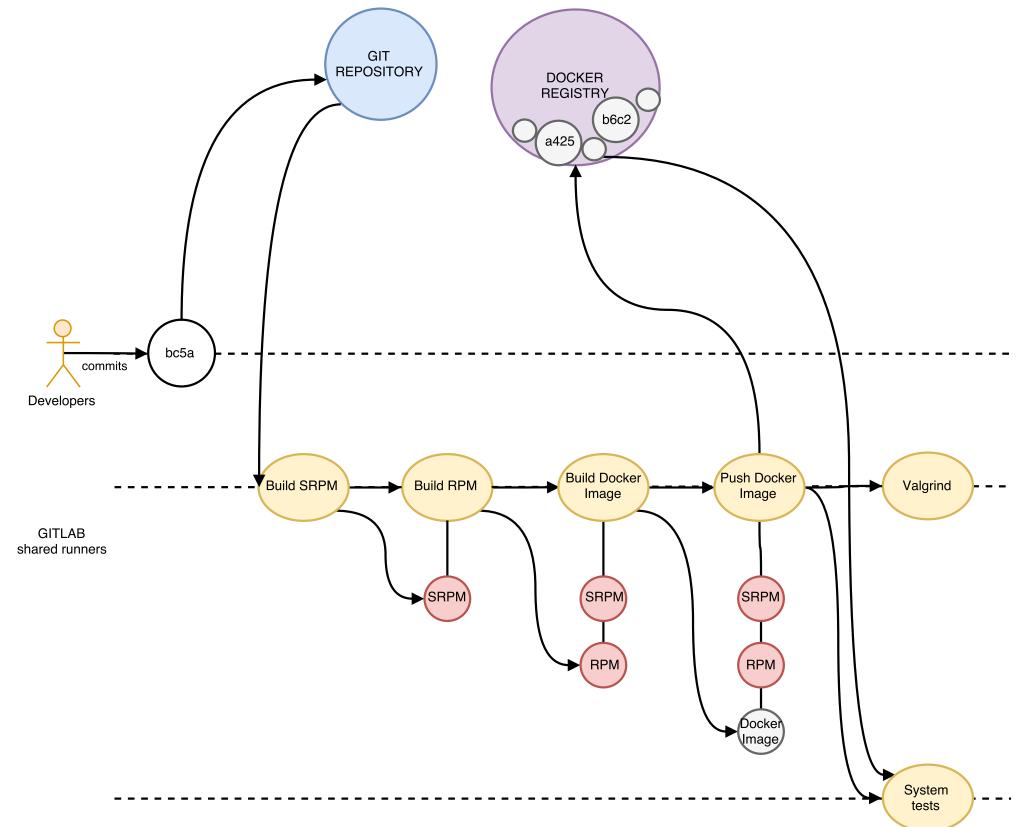

Build:Srpm		Build:Rpm		Build:Dockerimage	Rename:Dockerimage	
⊘ cta_srpm	a		0	Ctageneric_dock	Ctageneric_dock	

- Build software: CTA RPMs available as artifacts
- Build and publish a generic Docker image in gitlab registry
 - Contains all required versioned RPMs for **instantiation** (built artifacts, EOS, XROOTD)
- Run system tests in custom kubernetes cluster

Test

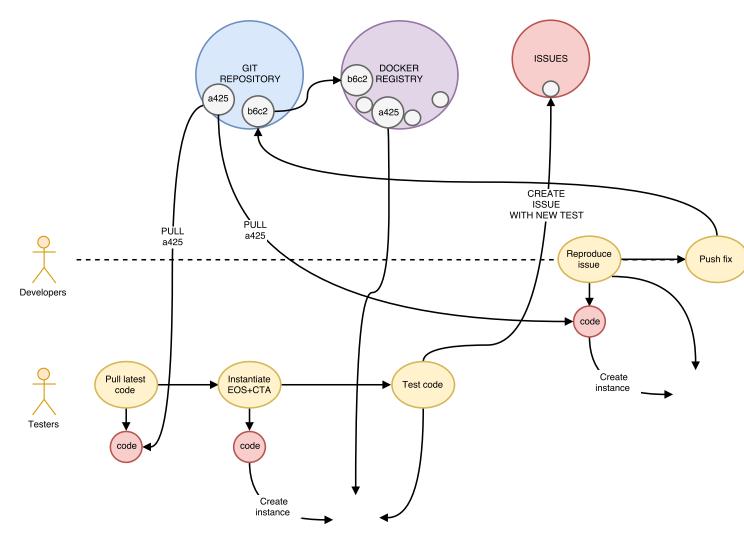

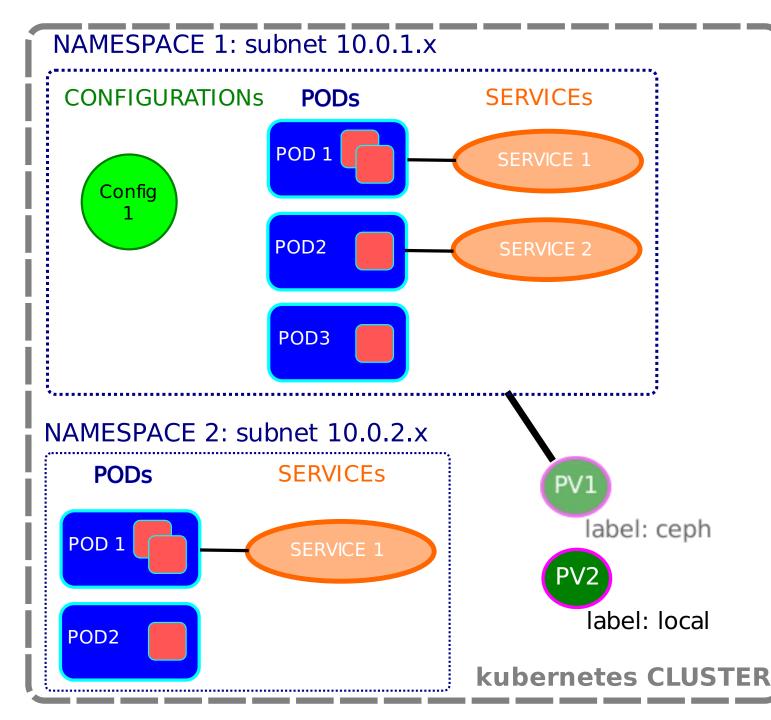

A COMMON REFERENCE INFRASTRUCTURE

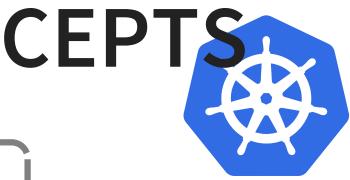

BASIC KUBERNETES CONCEPTS

KUBERNETES RESOURCES

System tests on dedicated kubernetes clusters

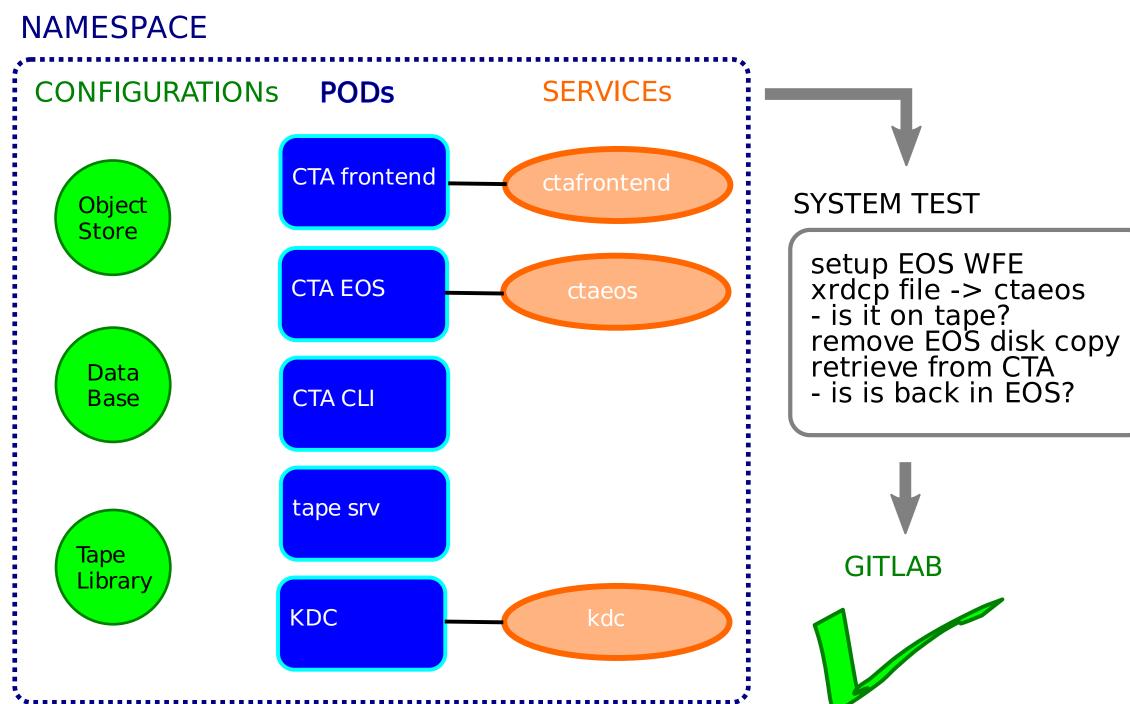

- One Puppet deployed kubernetes cluster per developer on a single VM
- Kubernetes resources per cluster:
 - I Oracle database (+ unlimited sqlite accounts)
 - I Ceph objectstore (+ unlimited local objectstores)
 - In 10 Virtual tape libraries: 2 tape drives, 10 tapes

INSTANTIATING A TEST

- Create k8 Namespace
- Instantiate all Services in the namespace
- Consumable resources are implemented as **Persistent Volumes**
 - Issue a Persistent Volume Claim with selector
 - Instantiate associated ConfigMaps in the Namespace
- Instantiate all the Pods with their associated containers to implement all the services
- Wait for all the pods to be ready

INSTANTIATING A TEST

REAL TAPE DRIVE TESTS

- Deploy Puppet manifest on real hardware
- Add physical tape library resources in hiera
- Increase timeouts for system tests

We can deploy the same kubernetes instance on real tape hardware and run exactly the same system tests.

THE END

- Very powerful approach addresses and federates all our use cases
- Fast, flexible, isolated and self contained in software repository
- Reproducible development environment that allows regression tests

TO DO

- Write more system tests
- Evaluate possible production use 🙄

🚷 Pod

Pods contain one or more containers that run together on a node, containing your application code.

Replication Controller

Replication controllers dynamically create instances of pods from templates, and remove pods when necessary.

🞯 Service

Services group pods and provide a common DNS name and an optional, load-balanced IP address to access them.

Nodes are the machines that run your containers.
