arXiv:1704.05478

Top Quark as a BSM probe

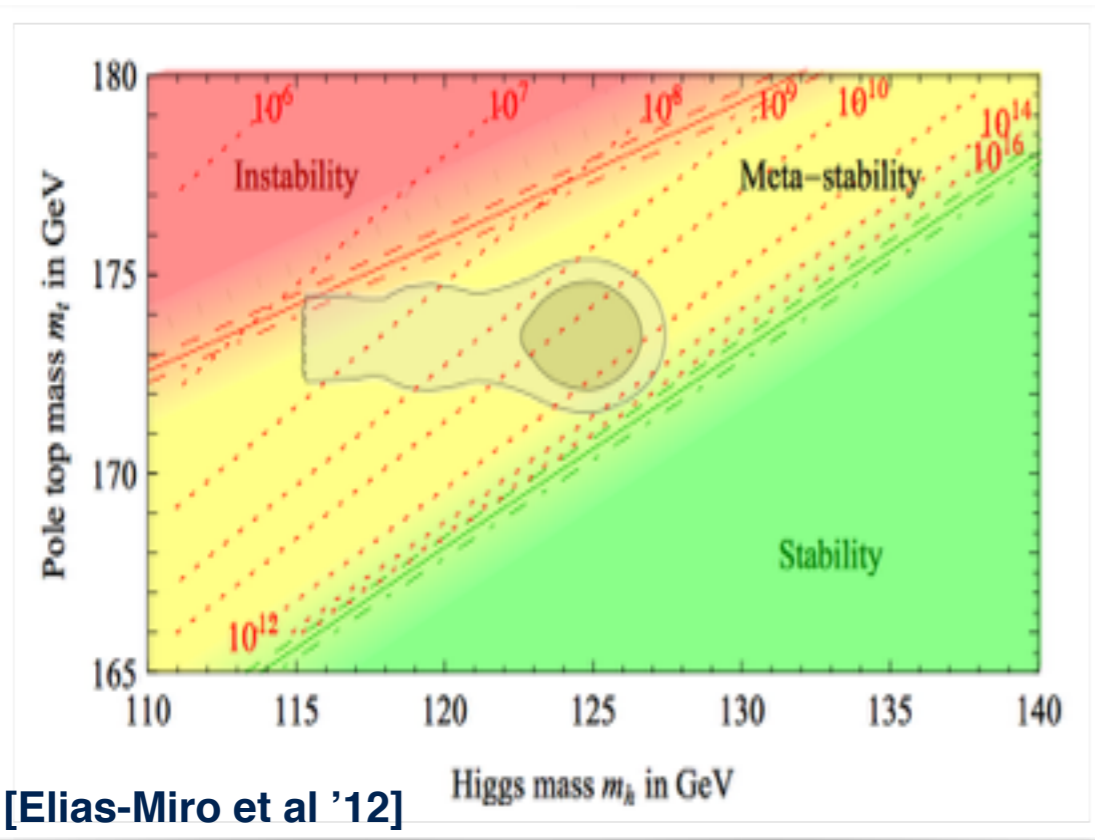

In the SM the top-quark yukawa coupling is of order one

$$y_t \sim 1 \quad m_t \sim v$$

$$m_t/m_b \sim 4 \times m_c/m_s, 100 \times m_u/m_d$$

Following naturalness paradigm it's expected to play a special role in NP searches

Also intimately connected with the nature and stability of the EW vacuum

Motivates an intense program for NP searches related to top physics

Searches for New Physics

New Physics searches can be broadly divided into two categories

Searches for New Physics

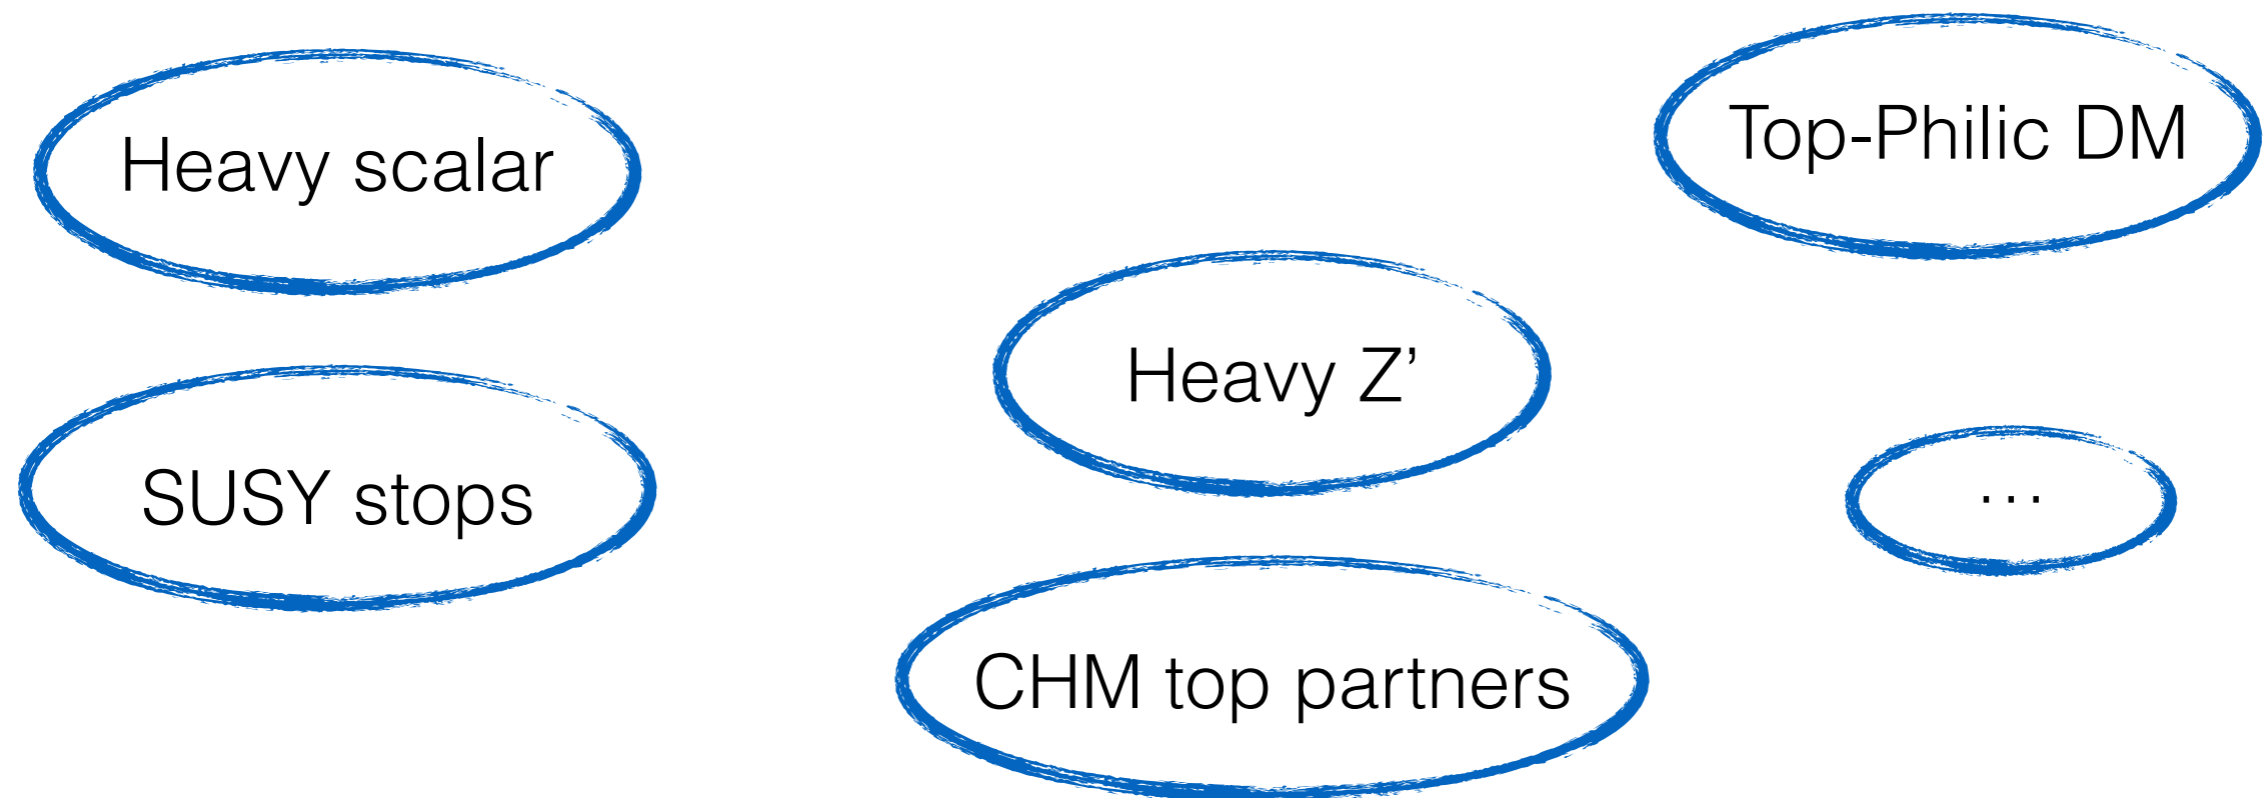

Direct searches for New Physics

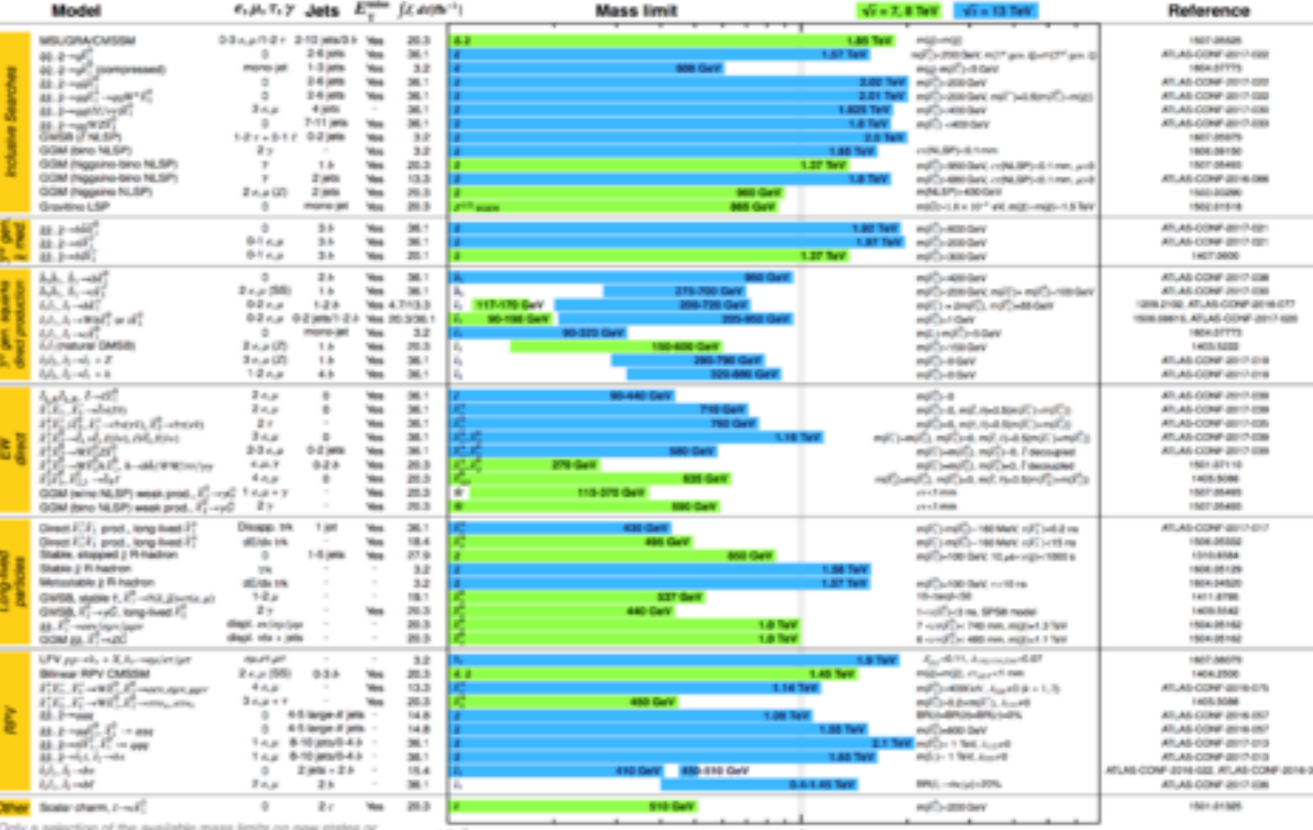

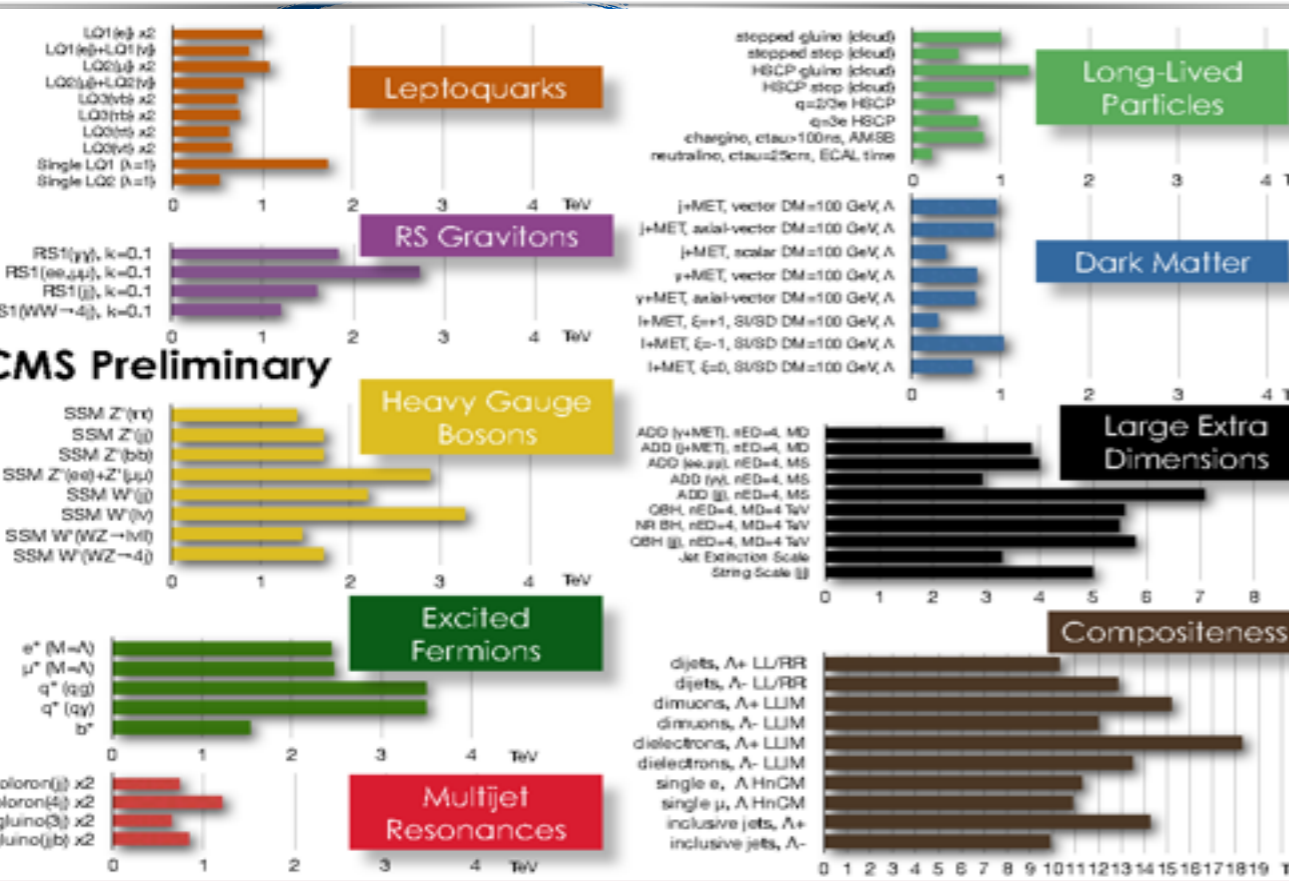

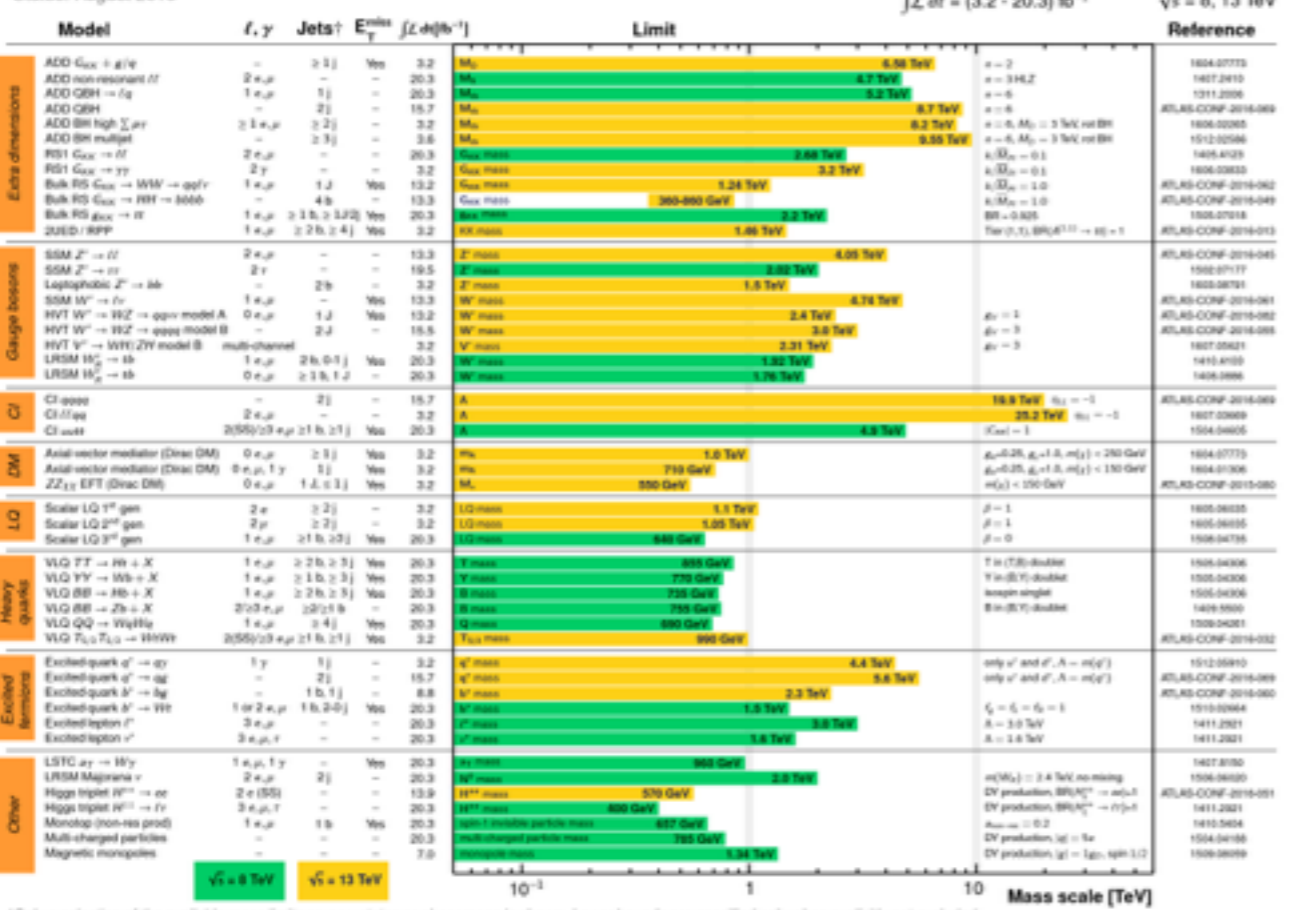

$$M_X < \sqrt{s}$$

- New states can be **resonantly** produced
- We search for them through their **decay** into SM states

A plethora of **resonances** connected with the top quark

Intense **experimental activity** aimed at the search for these states

Indirect search for New Physics

Experimental **results point** to a situation where $M_X \gg \sqrt{s}$

New states **too heavy** to be resonantly produced

$$\frac{1}{p^2 - M_X^2}$$

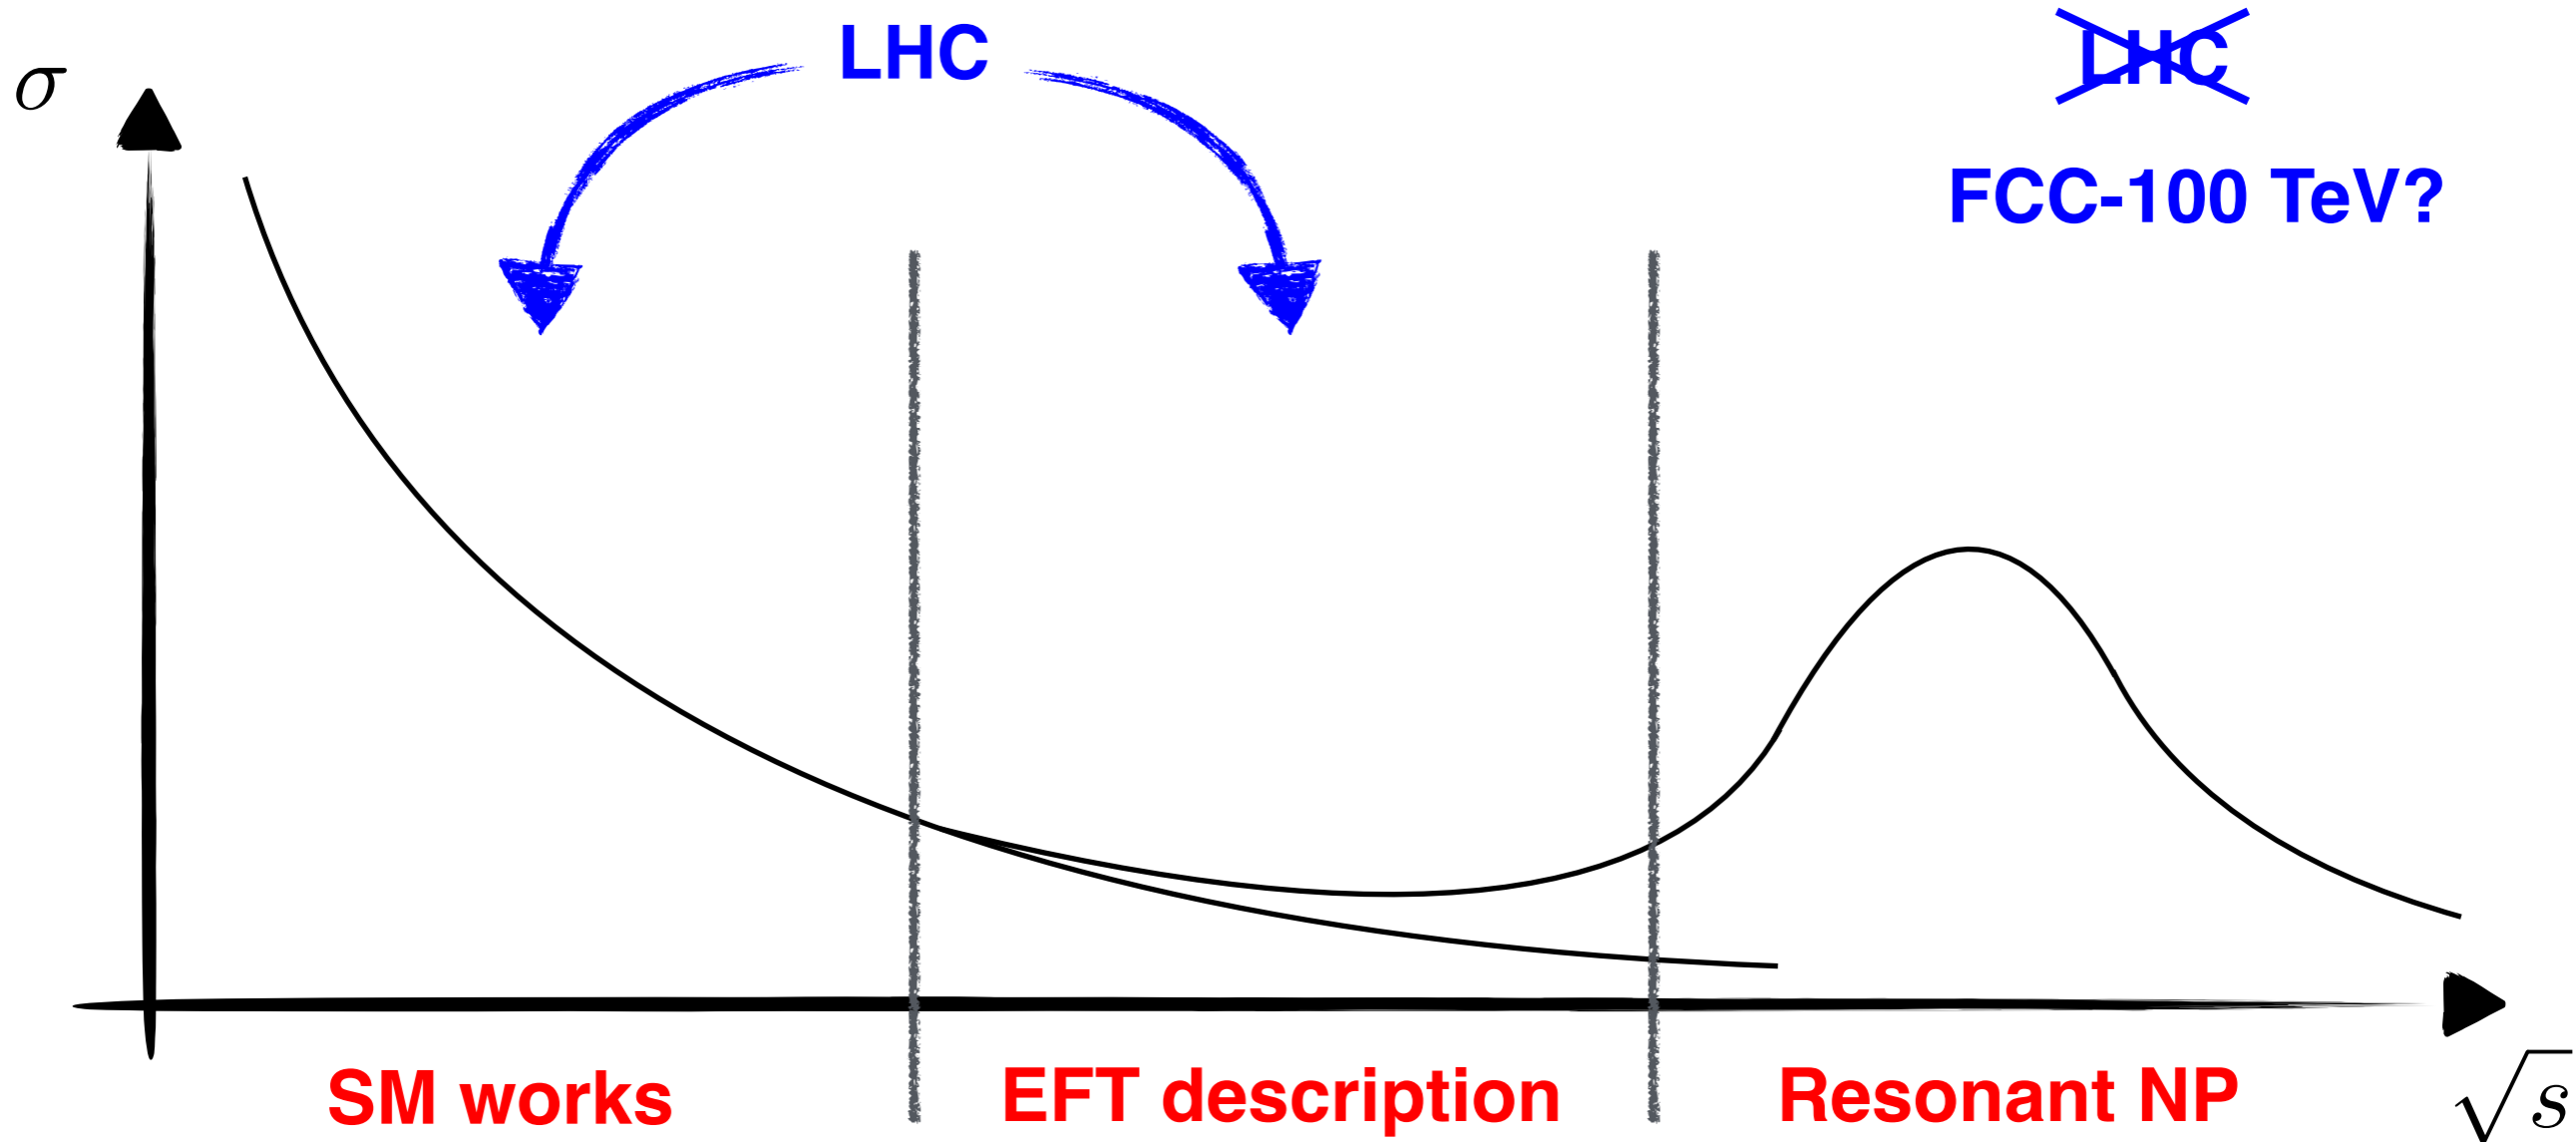

Heavy states can be **integrated out**

$$\frac{1}{M_X^2}$$

Search NP indirectly through **precision measurements** of SM observables

Powerful and **model independent tool** to guide experimental efforts

Standard Model EFT

$$\mathcal{L} = \mathcal{L}_{\text{SM}} + \frac{1}{\Lambda^2} \mathcal{O}^6 + \frac{1}{\Lambda^4} \mathcal{O}^8 + \dots$$

SM EFT - The top sector

A **complete** - non redundant - **basis** of dimensions six operators identified

[Warsaw basis - Grzadkowski et al. '10]

Operators affecting top quark pair production

Four fermions

Triple gluon

Dipole

Assumptions: flavor independence

All 4F operators enters with the same coefficient

$$\sum_f \bar{f} \gamma^\mu f \sim D_\nu G^{\nu\mu}$$

SM EFT - The top sector

Only two operators affecting the top quark - gluon interaction

$$\mathcal{O}_1 = \frac{C_1}{\Lambda^2} \bar{t} \gamma^\mu T^a t D^\nu G_{\mu\nu}^a$$

$$\mathcal{O}_2 = \frac{C_2}{\Lambda^2} \bar{t} \sigma^{\mu\nu} T^a t D^\nu G_{\mu\nu}^a \tilde{\Phi} \xrightarrow{\text{VEV}} \frac{C_2}{\Lambda^2} v \bar{t} \sigma^{\mu\nu} T^a t D^\nu G_{\mu\nu}^a$$

They can be seen as the leading terms of the [Dirac and Pauli form factors](#)

$$e \gamma_\mu F_1(q^2) + ie \frac{\sigma_{\mu\nu} q^\nu}{2M} F_2(q^2)$$

Abelian - QED

$$\frac{C_1}{\Lambda^2} \gamma^\mu f_1 \left(\frac{D^2}{\Lambda^2} \right) D^\nu G_{\mu\nu} + \frac{C_2}{\Lambda} \sigma^{\mu\nu} f_2 \left(\frac{D^2}{\Lambda^2} \right) G_{\mu\nu}$$

Non abelian - QCD

Interpretation in terms of [top quark intrinsic structure](#)

Non abelian nature however gives rise to interaction with [multiple bosons](#)

Constraints from measurements of total $t\bar{t}$ cross section

Most precise 13 TeV LHC result

$$\sigma(pp \rightarrow t\bar{t}) = 835 \pm 3 \text{ (stat)} \pm 23 \text{ (syst)} \pm 23 \text{ (lum)} \text{ pb} \quad \sim 3.9\%$$

$$\mathcal{O}_1 = \frac{C_1}{\Lambda^2} \bar{t} \gamma^\mu T^a t D^\nu G_{\mu\nu}^a$$

Does not affect $gg \rightarrow t\bar{t}$ production

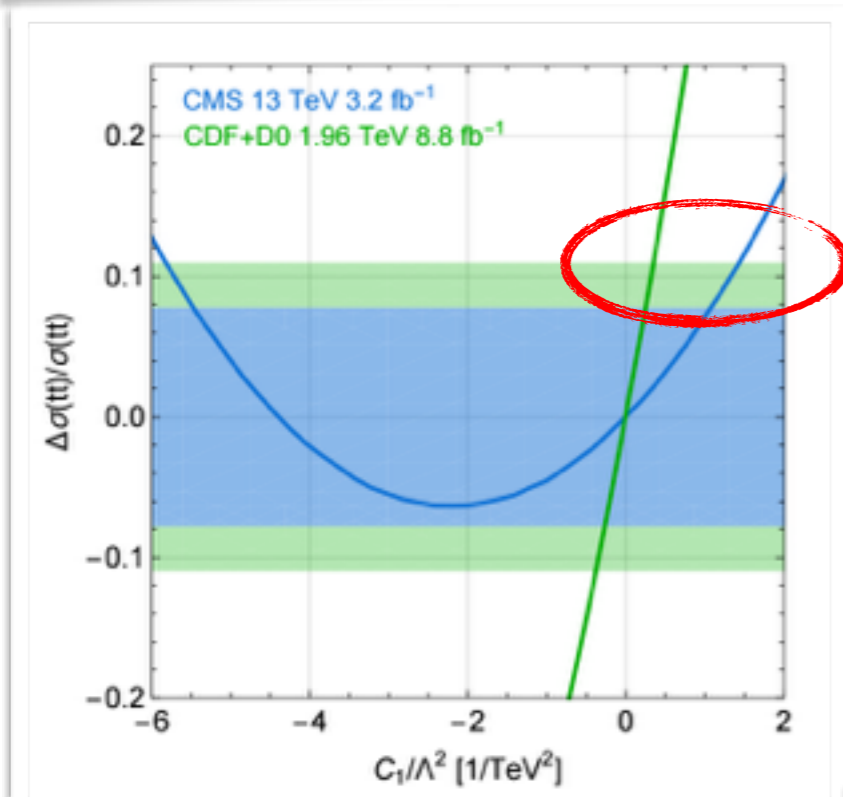

$$\sigma(gg \rightarrow t\bar{t}) / \sigma(q\bar{q} \rightarrow t\bar{t}) \quad \left\{ \begin{array}{l} \text{LHC} \sim 6 \\ \text{Tevatron} \sim 0.1 \end{array} \right.$$

Tevatron results can still be important to bound \mathcal{O}_1

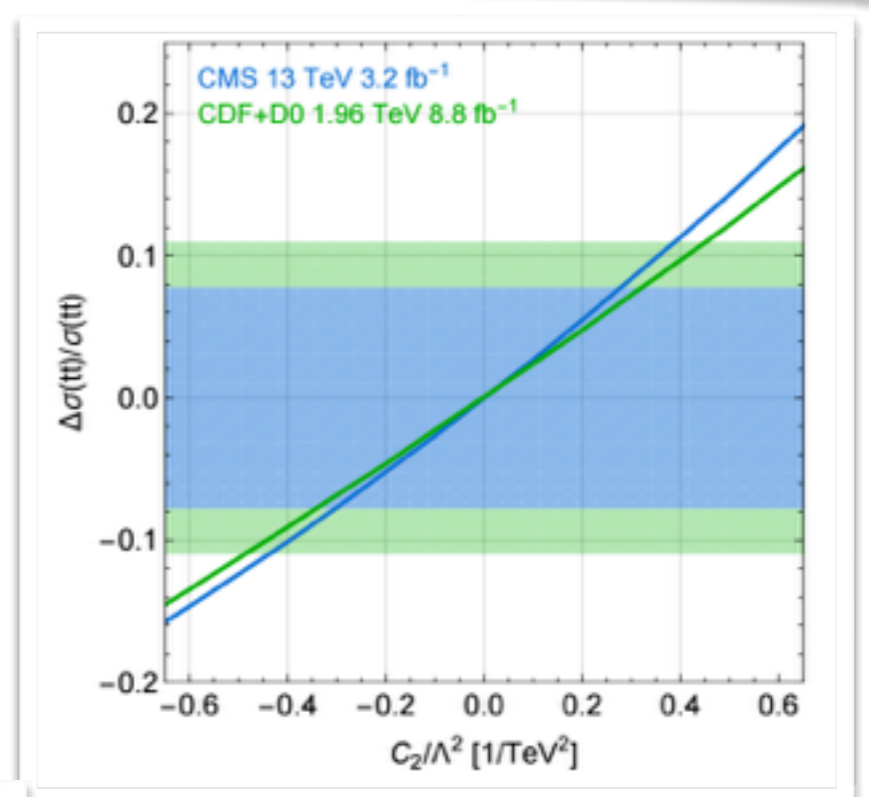

CDF and D0 final combination

$$\sigma(p\bar{p} \rightarrow t\bar{t}) = 7.65 \pm 0.42 \text{ pb} \quad \sim 5.5\%$$

Constraints from measurements of total $t\bar{t}$ cross section

Poor LHC sensitivity on \mathcal{O}_1

LHC and Tevatron measurements are complementary

Constraints from differential measurements

$$\sigma(pp \rightarrow t\bar{t}) \sim 800 \text{ pb}$$

$$\mathcal{L} = 100 \text{ fb}^{-1} \rightarrow 8 \times 10^7 \text{ top pairs}$$

$$\mathcal{L} = 3000 \text{ fb}^{-1} \rightarrow 24 \times 10^8 \text{ top pairs}$$

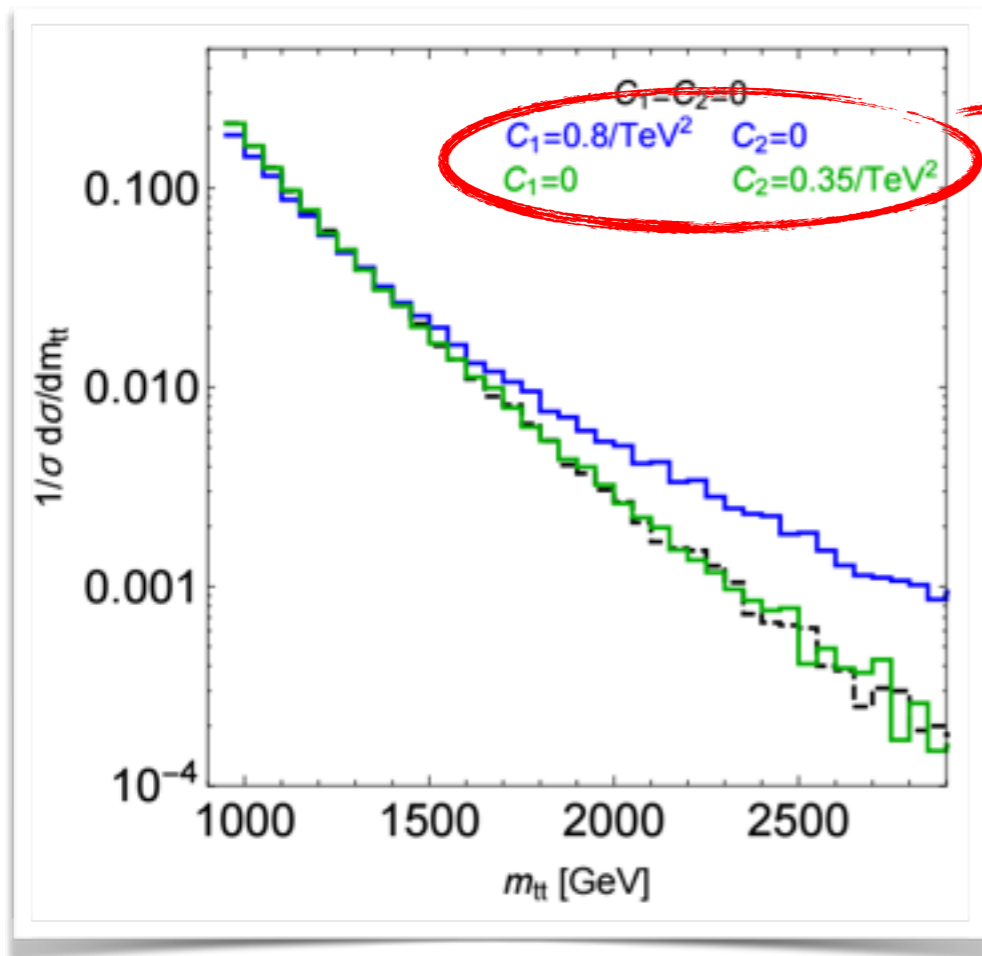

The LHC acts as a **top factory**

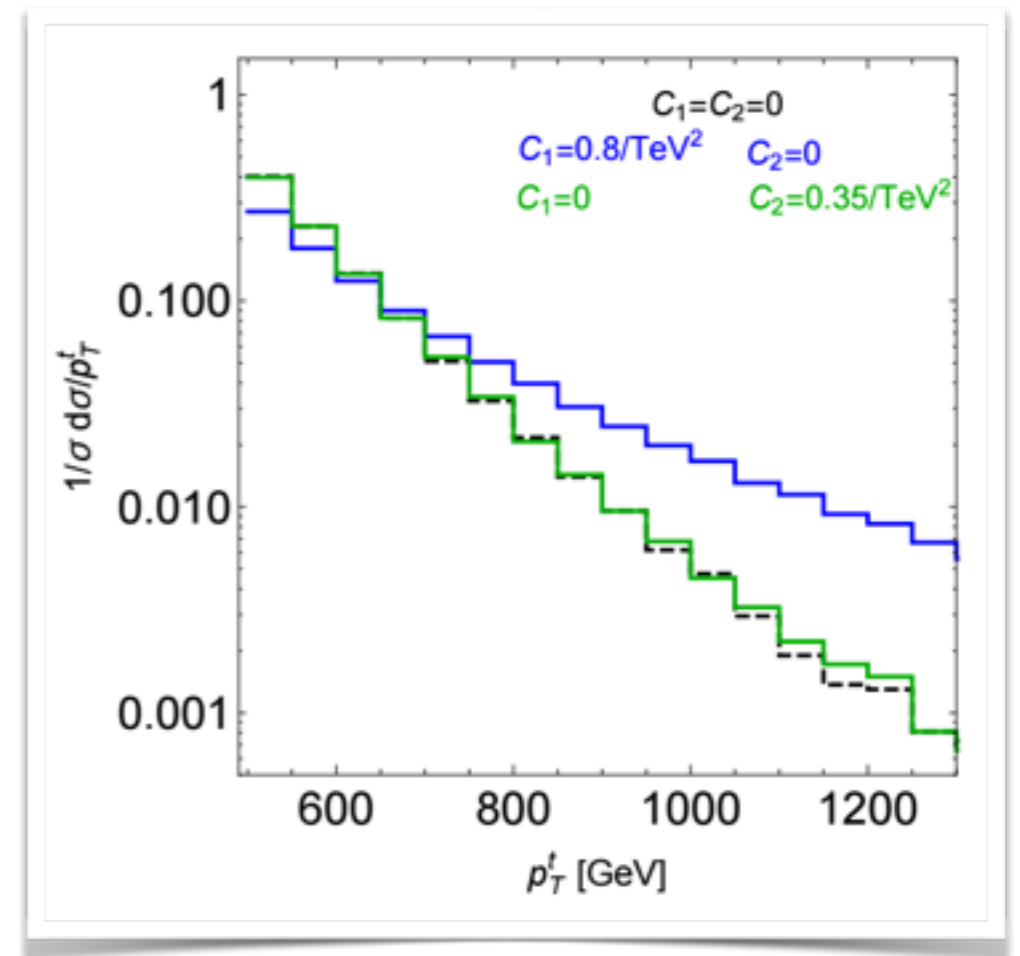

High statistic expected in the **tails** of the differential distributions, i.e. where we are more sensitive to higher dimensional operators

Differential measurements are a powerful probe to test the top quark EFT

Constraints from differential measurements

Within the bounds
from total xs

Insertion of the \mathcal{O}_1 operator causes a **stronger enhancement** at high masses

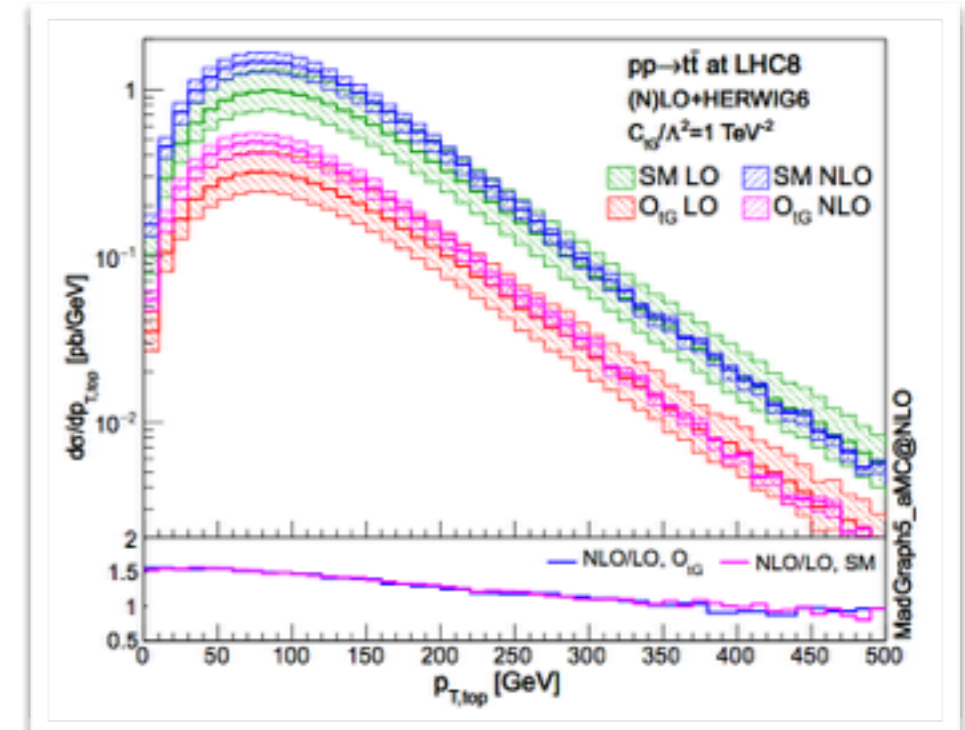

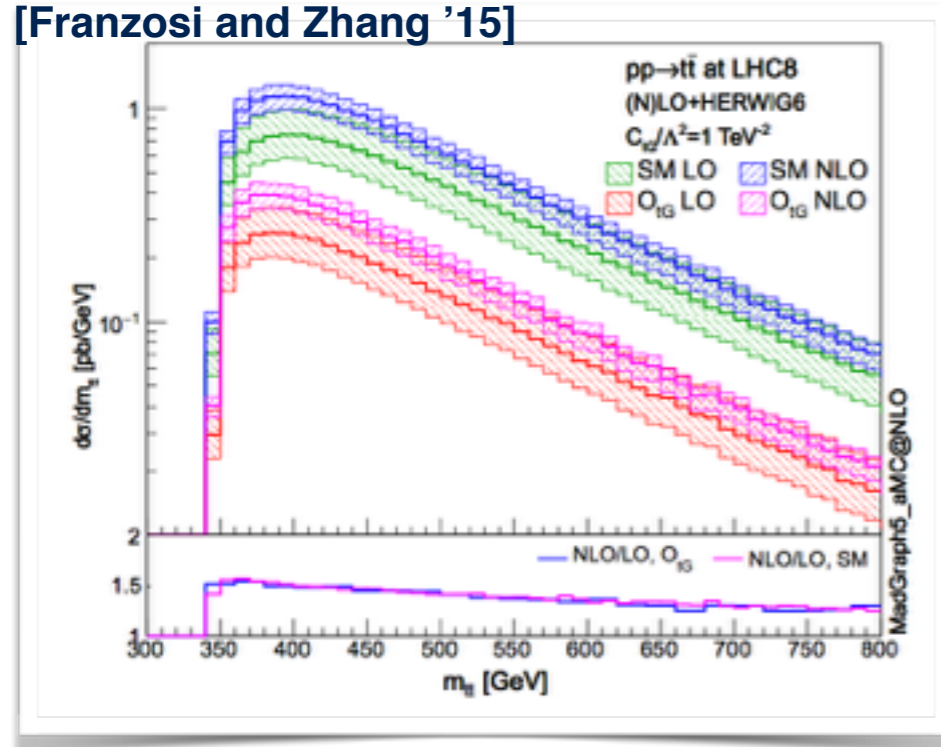

Normalized distributions **less sensitive** to the insertion of the operator \mathcal{O}_2

This suggests that \mathcal{O}_1 can be constrained **independently** of \mathcal{O}_2 !

Higher order corrections impact

Inclusion of NLO corrections for the \mathcal{O}_2 operator

[Franzosi and Zhang '15]

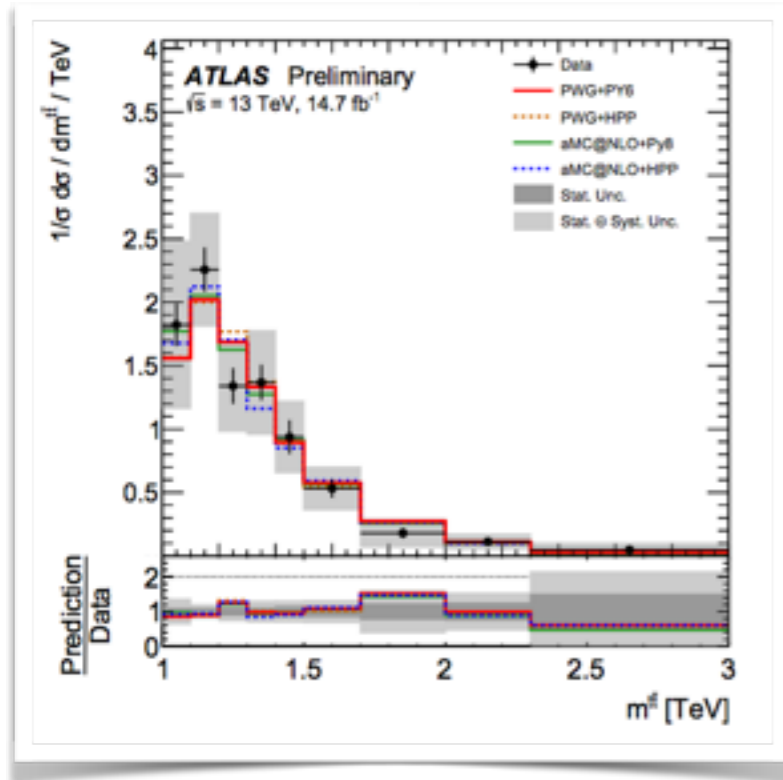

Total and diff. k-factors **equal** for SM and EFT - **cancels** out in normalized xs

Shape difference in \mathcal{O}_2 **relevant**
for a **future** FCC -100 TeV

[Aguilar-Saavedra et al '14]

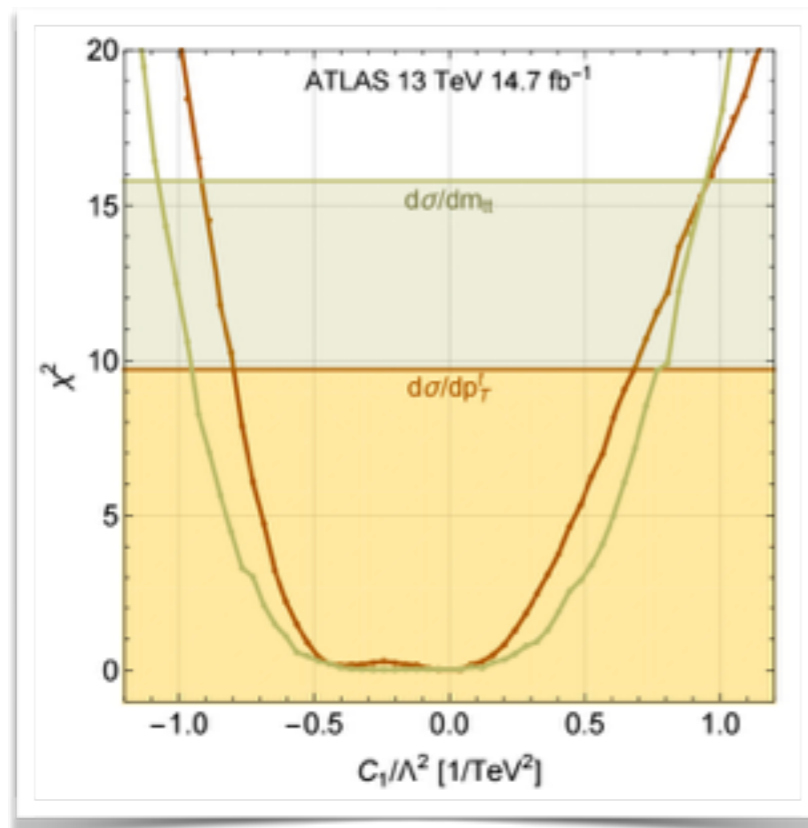

Constraints from differential measurements

$m_{t\bar{t}}$ [TeV]	1.0	1.1	1.2	1.3	1.4	1.5	1.7	2.0	2.3-3.0
Error [%]	36	20	25	30	31	32	63	58	123

p_T^t [TeV]	0.5	0.55	0.6	0.65	0.75	0.9-1.2
Error [%]	19	25	28	45	73	95

[ATLAS-CONF-2016-100]

Perform a χ^2 fit

$|C_1| < 0.7/\text{TeV}^2$

comparable to the bound obtained by total cross section measurement

Constraints from Higgs observables

$$\mathcal{O}_1 = \frac{C_1}{\Lambda^2} \bar{t} \gamma^\mu T^a t D^\nu G_{\mu\nu}^a$$

\mathcal{O}_1 vanishes when coupled to on-shell gluons

Higgs production cross section constrain only the \mathcal{O}_2 operator

$$(\mathcal{M}_{\mathcal{O}_2})_{\lambda_1 \lambda_2}^{ab} = 4 \times g_s \frac{y_t}{\sqrt{2}} \frac{2C_2}{\Lambda} \frac{1}{16\pi^2} (m_H^2 g_{\mu\nu} - 2q_{2\mu} q_{1\nu}) \epsilon_{\lambda_1}^\mu(q_1) \epsilon_{\lambda_2}^\nu(q_2) \text{Tr} [T^a T^b] \times \left\{ \frac{1}{\epsilon} + 1 + \log \frac{\mu^2}{m_t^2} \right. \\ \left. + \frac{m_t^2}{m_H^2} \log^2 \left(\frac{\sqrt{m_H^4 - 4m_t^2 m_H^2} + 2m_t^2 - m_H^2}{2m_t^2} \right) + \frac{\sqrt{m_H^4 - 4m_t^2 m_H^2}}{m_H^2} \log \left(\frac{\sqrt{m_H^4 - 4m_t^2 m_H^2} + 2m_t^2 - m_H^2}{2m_t^2} \right) \right\}$$

Counter-term proportional to $\mathcal{O}_{HG} = H^\dagger H G_{\mu\nu}^a G_a^{\mu\nu}$

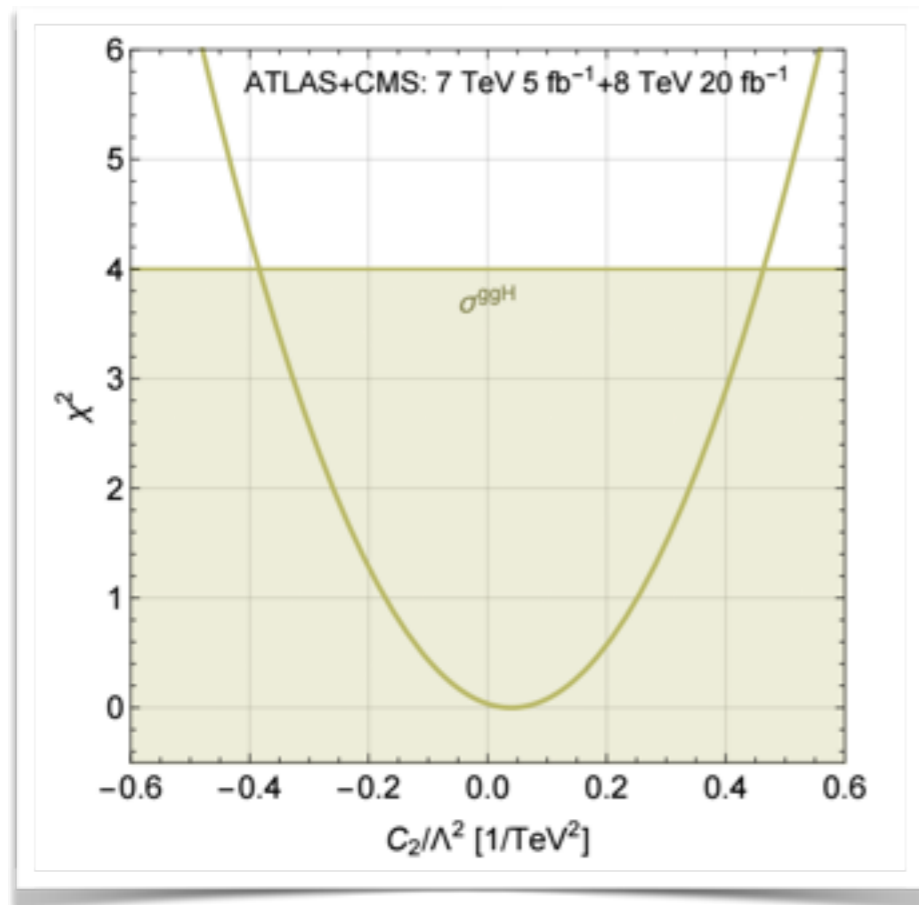

Fix $\mu = m_H$

Constraints from Higgs observables

$$\mu_{O_2} \simeq 1 + 0.755 \text{ TeV}^2 \frac{C_2}{\Lambda^2}.$$

Production process	ATLAS+CMS	ATLAS	CMS
μ_{ggF}	$1.03^{+0.17}_{-0.15}$	$1.25^{+0.24}_{-0.21}$	$0.84^{+0.19}_{-0.16}$

**ATLAS & CMS
Run-1 combination**

$$|C_2| < 0.4/\text{TeV}^2$$

comparable to the bound obtained
by total cross section measurement

Prospects for the LHC

Current measurements can already be used to set competitive and independent limits on \mathcal{O}_1 and \mathcal{O}_2

Total $t\bar{t}$ cross section measurements dominated by systematics $\sim 4\%$

Unlikely to improve

Differential $t\bar{t}$ measurements and Higgs couplings determination are expected to become more precise with accumulation of more statistics

Prospects for the LHC

Differential measurements

Assume a **luminosity dependent rescaling** of the systematic uncertainties with a 15% floor

$$\frac{\Delta\sigma}{\sigma} \Big|_{\mathcal{L}} = \text{Max} \left[0.15, \frac{\Delta\sigma}{\sigma} \Big|_{\mathcal{L}_0} \times \sqrt{\frac{\mathcal{L}}{\mathcal{L}_0}} \right]$$

Higgs signal strength

[CMS-NOTE-2012-006]

Coupling	Uncertainty (%)			
	300 fb ⁻¹		3000 fb ⁻¹	
	Scenario 1	Scenario 2	Scenario 1	Scenario 2
κ_γ	6.5	5.1	5.4	1.5
κ_V	5.7	2.7	4.5	1.0
κ_g	11	5.7	7.5	2.7
κ_b	15	6.9	11	2.7
κ_t	14	8.7	8.0	3.9
κ_τ	8.5	5.1	5.4	2.0

Assume **CMS projections** on Higgs coupling measurements

SM EFT - the top sector

SM EFT - the top sector

LHC 300 fb ⁻¹	LHC 3000 fb ⁻¹
$-0.49 < C_1/\Lambda^2 < 0.19$	$-0.47 < C_1/\Lambda^2 < 0.19$
$-0.15 < C_2/\Lambda^2 < 0.15$	$-0.07 < C_2/\Lambda^2 < 0.07$

Higgs coupling with 300/fb will provide the **most stringent** limits of \mathcal{O}_2

At the end of the LHC program **most stringent limits** on \mathcal{O}_1 and \mathcal{O}_2 can be set

Bound on NP scale

$$C_1 = C_2 = 4\pi \rightarrow \Lambda \sim 5 \text{ TeV} \quad \text{Within EFT validity}$$

Conclusions

- Searches for NP are **testing the TeV scale** also in the top sector
- **No signs on heavy resonances** in LHC data - NP too heavy?

- **EFT** framework provide a **model independent** approach for NP searches
- It's **important** to test the impact of **many observables** in the top quark coupling determination. Relevant also for **global fit** approaches
- **Normalized distributions** for top quark production together with **Higgs production** measurements provide **independent observables** to bound non standard top-gluon interactions
- These observables are expected to be **more sensitive** than total cross section measurements which is already dominated by systematics
