

WLCG

Computing resources for handling LHC data and using them.

- **The detectors**
- **LHC Computing**
- **What is a GRID ?**
- **But why a GRID for LHC ?**
- **LCG : Large Hydron Colider Computing Grid**
- **Dataflow**
- **WLCG software**
- **WLCG context**
- **Achievements**
- **Problems**
- **Questions**
- **Links**

Louis Poncet IT/GD

Louis Poncet IT/GD

- **The aims of LCG is to give to Physicist computing resources able to use the data coming out from the LHC detectors**
 - Atlas
 - Alice
 - CMS
 - LHCb
- **Estimation of 15 Petabytes of usable data per year**
- **Average of 0.1 – 1 Go/sec**
- **We need to process the data around 150,000 cores with at least 2 Gig of RAM per core**
- **The problematic is unsolvable with one computing centre**

- **Grid computing is a word in distributed computing domain which can have several meanings:**
 - A local computer cluster which is like a "grid" because it is composed of multiple nodes, batch system and advanced network storage
 - Offering online computation or storage as a metered commercial service, known as utility computing, computing on demand, or cloud computing, Amazon EC2
 - The creation of a "virtual supercomputer" by using spare computing resources within an organization, BOINC
 - **The creation of a "virtual supercomputer" by using a network of geographically dispersed computers. Volunteer computing, which generally focuses on scientific, mathematical, and academic problems, is the most common application of this technology (Wikipedia definition)**

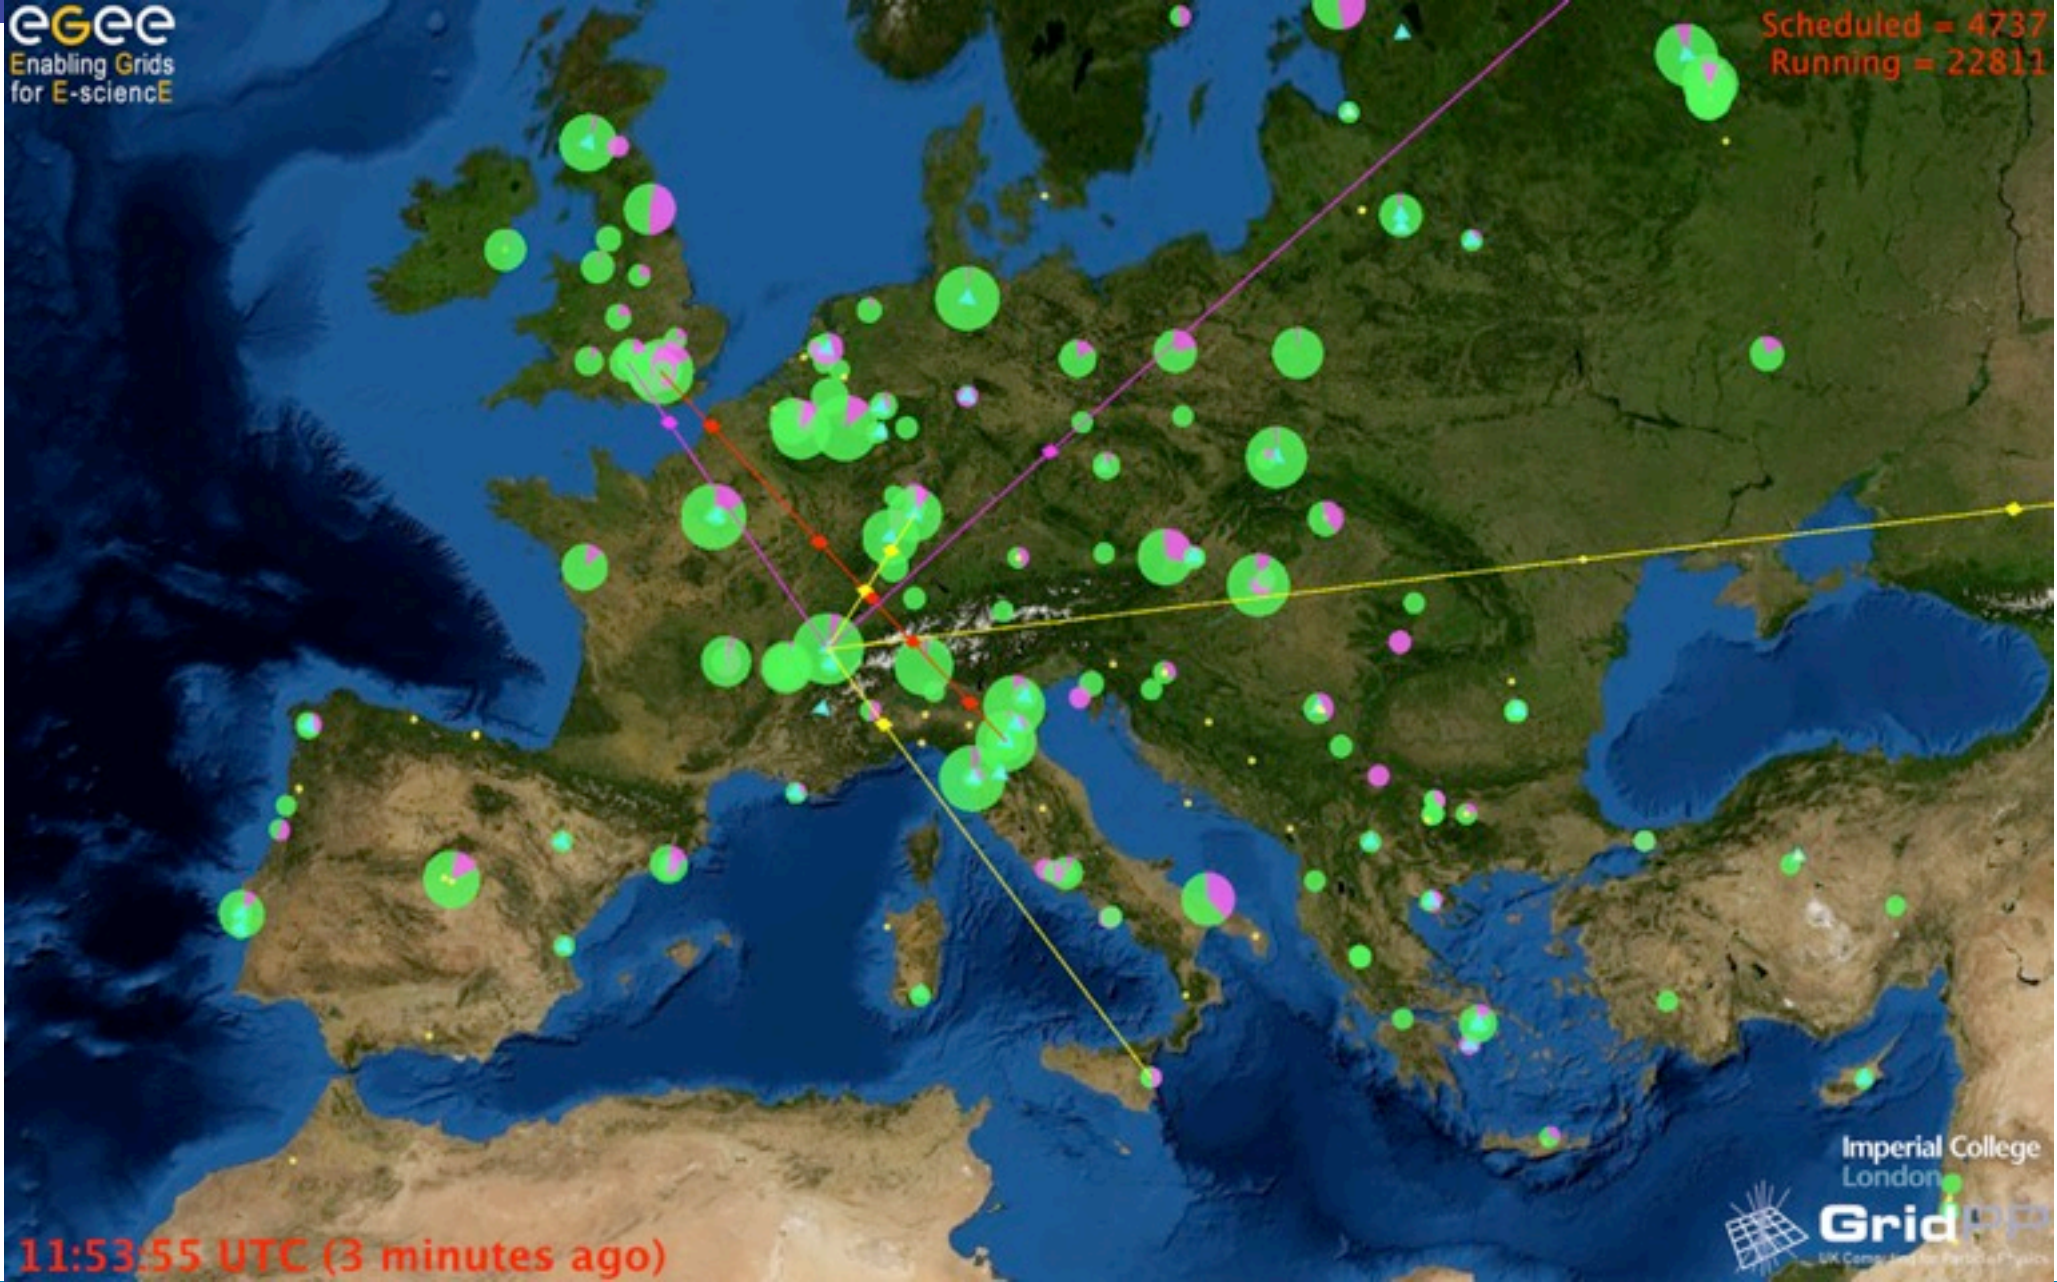

- **Multiple copies of data that can be kept in different sites**
- **Optimum use of spare capacity of all CC in the project**
- **No single point of failure**
- **The cost of maintenance and upgrade is also distributed**
- **Diversity in the way to use computing resource**
- **The system can be partially change and reconfigure depending of the user requirement**
- **Flexibility in deciding how and where to provide future computing resources**
- **Sharing of the knowledge of new technologies**
- **Cost sharing resources in different places permit a reduce of cost by using the existing structure**

- **What is LCG :**
 - The architecture choose for processing LHC data
 - A deployment team of 300 persons
 - Application support for the 4 experiments
 - A team of data storage experts

 - Status 31st July 2009
 - 283 sites
 - 67k jobs / per week
- **Maintenance :**
 - Monitoring all sites every 4 hours
 - Information about sites status renew every 7 minutes
 - Continental support for computing centers
 - Tracking problems for a worldwide service

Scheduled = 4737
Running = 22811

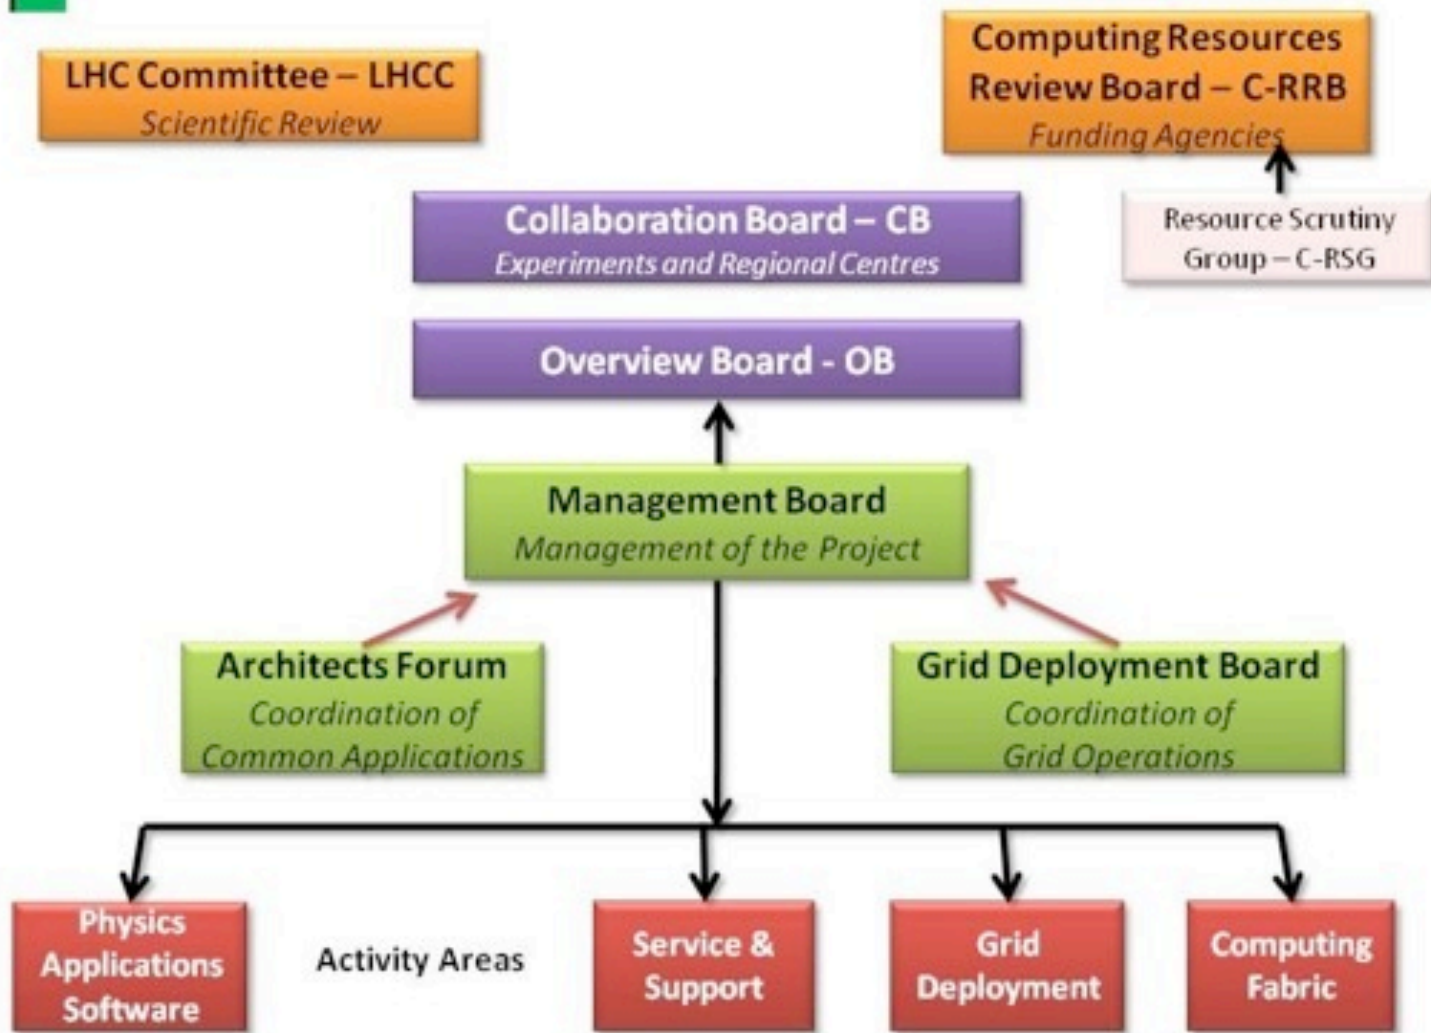

11:53:55 UTC (3 minutes ago)

- **gLite middleware**
- **ARC middleware**
- **OSG middleware**
- **Fabric management**
- **Monitoring tools**
- **Physics software**
 - ROOT (data analysis advance framework)
 - POOL (data management)
 - ARDA (A Realisation of Distributed Analysis)
- **Networking**
 - Links between Tier 0 > Tier 1

Worldwide LCG Organisation

- **WLCG is a collaboration of various grid organisations**
 - EGEE (Enabling Grid for E-ScienceE)
 - OSG (Open Science Grid)
- **National and regional Grid structure**
 - GridPP (UK)
 - INFN Grid (Italy)
 - NorduGrid (Nordic region)
- **Part of the Globus Alliance**
 - involve in the support of Globus and uses the Globus-based Virtual Data Toolkit
- **Work with industry**
 - in particular through the CERN openlab

- **A Grid install on 283 sites is really hard to maintain**
 - New version of the middleware require lot of sysadmin attention
 - Each centre are unique with pretty long history
 - They always need to check that the middleware does not affect other activities of there computing centers
- **We have problem to get the properly compiled part of the middle-ware**
- **Monitoring and test has to be really close to the evolution of new functionality of the middleware**
- **Where the problems come from :**
 - Configuration of the middleware
 - Bug in the code of the middleware
 - Site configuration : Os, network infrastructure, security local policy, national computing severity policy.

- **Monitoring tools :**
 - <http://gridportal.hep.ph.ic.ac.uk/rtm/>
- **CERN LCG website**
 - <http://lcg.web.cern.ch/LCG/>
- **GRID Cafe**
 - <http://gridcafe.web.cern.ch/gridcafe/>
- **NOVA science physics program**
 - <http://www.pbs.org/wgbh/nova/sciencenow/3410/02.html>
- **OpenScienceGrid**
 -

- **Results :**
 - Data transfer worldwide record
 - “First 500 Terabytes Transmitted via LHCGlobal Grid” (Slashdot Apr 25 2005).
 - Around 30K cpus on the grid active from 150 to 270 active site, 14 petabytes.
 - Around 30K jobs running per day.
 - BIOMED has used 420 Years of CPU time Worth of Data within 4 Months (Slashdot Sep 17 2007).
- **Interoperability :**
 - Interoperation with OSG is perfectly working.
 - Interoperability with NAREGI ready.
- **Quality of cooperation increase every day.**
