

Autofocusing

- Left: TGraph from labVIEW fit results [now outdated]
- Pulled $-dI/dR$ data from LabVIEW directly; fit with ROOT
 - Allows us to propagate errors through all fits. I have the errors now on the mean and SD
- Importing fit results into TGraphErrors and fitting with quadratic again
- Current status: Issue with import (Line enter character?)

BNL Misc.

- Fixed Git code back up
 - Independent forks on personal Git accounts from a “master code” on the sciollalab Git account
 - Prevents “check in” issues
 - Backing up VIs means that even 1 small shifted wire is under version control and can appear as a “conflict” preventing check in. Using independent forks fixes this
 - Listing each other as collaborators on our personal forks so that we can view each other’s code
- Prepped talk for Monday Strip Module Meeting “Brandeis Report”
 - See set of slides
 - <10 minutes talk
 - To review with Gerrit today
 - Last BNL update on Stave Assembly *with slides* was 4 October 2016 — lots to say in short amount of time
