# Introduction

## Evidence for DM: Galaxy Rotation Curves

- DM existence suggested in 1933 by Zwicky (missing mass in Coma cluster, virial theorem)
- In 1970, Rubin and others measured rotation curves of many galaxies and found flat rotation curves

$$\frac{GMm}{r^2} = m \frac{v^2}{r} \rightarrow v(r) = \sqrt{\frac{GM(r)}{r}} \propto \begin{cases} \frac{1}{\sqrt{r}} & : M(r) = \text{const} \\ \text{const} & : M(r) \propto r \end{cases} \quad (1)$$

# Introduction

## Evidence for DM: Gravitational Lensing (Bullet Cluster)

- Red: X-rays emission, tracing baryonic matter
- Blue: gravitational lensing effect, tracing matter
- The region, where most of the baryonic matter is, does not match the one where most of the matter is: most of the matter has to be "dark"

# Introduction

## Evidence for DM: Numerical Simulations

- Dark Matter collapses in Dark halos much before ordinary matter
- Ordinary matter is slowed by pressure due to photons
- When photons decouple (recombination), ordinary matter falls in gravitational wells generated by DM
- Without DM, galaxy formation would occur later and LSS would be different
- DM has to be cold to allow for observed bottom-up hierarchy (hot DM would generate top-down hierarchy)

# Introduction

## Evidence for DM: CMB

- Baryons fell into the gravitational potential wells
- Compression  $\rightarrow$  hotter plasma  $\rightarrow$  increasing photons pressure
- Radiation pressure  $\rightarrow$  compression halted  $\rightarrow$  Expansion and cooling  $\rightarrow$  less radiation pressure
- Decreased radiation pressure  $\rightarrow$  gravity again dominated  $\rightarrow$  another compression phase  $\rightarrow$  BAO

# Introduction

## Evidence for DM: Nucleosyntesys

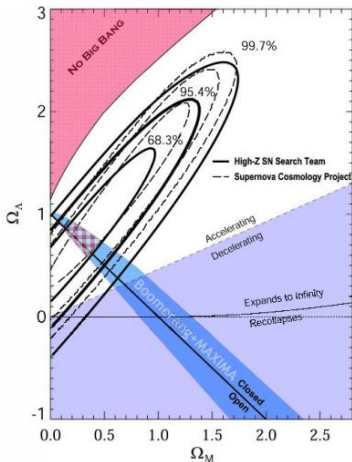

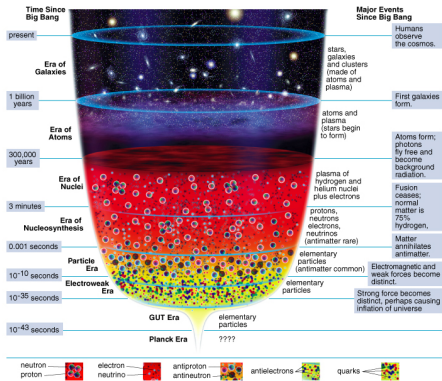

- Big Bang Nucleosyntesys (BBN): formation of light elements
- Depends mostly on  $\Omega_b$
- Very good agreement between BBN and CMB values for  $\Omega_b$

# Introduction

DM Candidates

- Mass range:  $10^{-28} \text{ eV} < m_\chi < 10^{24} \text{ Kg!}$
- Axions, PBH and weak-scale particles

# Introduction

## DM Candidates: WIMP

- WIMP miracle: particle with  $m_\chi \sim m_{weak}$  and  $g \sim g_{weak}$  gives right relic abundance by freeze-out
- When DM interaction rate is smaller than expansion rate ( $m_\chi/T \sim \mathcal{O}(30)$ ) it decouples from thermal bath  $\rightarrow$  DM abundance gets fixed
- WIMP can be searched in multiple ways

- DM cannot be detected by detectors  $\rightarrow$  missing energy
- Can infer the presence of missing particles by imbalance in transverse momentum
- Also neutrinos cannot be detected at collider, like DM

# Dark Matter at Collider

Dark Matter signatures: Mono-Jet

- One or more jets (usually ISR)
- Expected to deliver largest signal (at least for low  $m_\chi$ )
- Background also large ( $pp \rightarrow jZ, Z \rightarrow \nu\bar{\nu}$ )
- Usually systematically limited

arXiv:1604.07773

# Dark Matter at Collider

## Dark Matter signatures: Mono-X

- $X = W^\pm, Z, \gamma, h$
- Signal significantly smaller (unless model has direct coupling to the emitted particle, i.e. not only ISR radiation)
- Signal much cleaner than mono-jet (especially for non-hadronic decays)
- Usually statistically limited

ATLAS-CONF-2016-056, 1609.04572

# Dark Matter at Collider

Dark Matter signatures:  $t\bar{t} + \cancel{E}_T$ ,  $b\bar{b} + \cancel{E}_T$

- Also features small cross section
- Important for top-philic DM models
- Very clean signal (especially fully-leptonic channel)
- Usually statistically limited

1410.4031 (ATLAS-CONF-2016-086)

# Dark Matter at Collider

Dark Matter signatures: invisible Higgs decays (VBF)

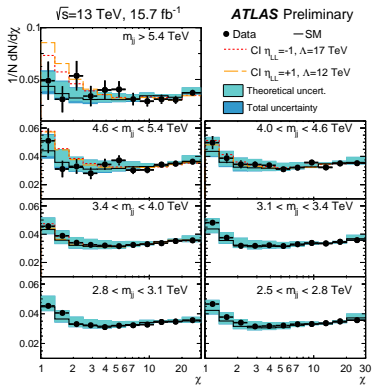

- If DM light enough  $h \rightarrow \chi\bar{\chi}$  could be allowed
- VBF Distinctive topology, allows background discrimination
- Can also investigate DM models with new VBF operators

1508.07869

# Dark Matter at Collider

Dark Matter signatures: dijet (and diphoton)

- Complementary search
- Useful with simplified models (s-channel), and large  $m_\chi$
- Can use both invariant mass distribution (narrow-width) and angular distrib. (large width)

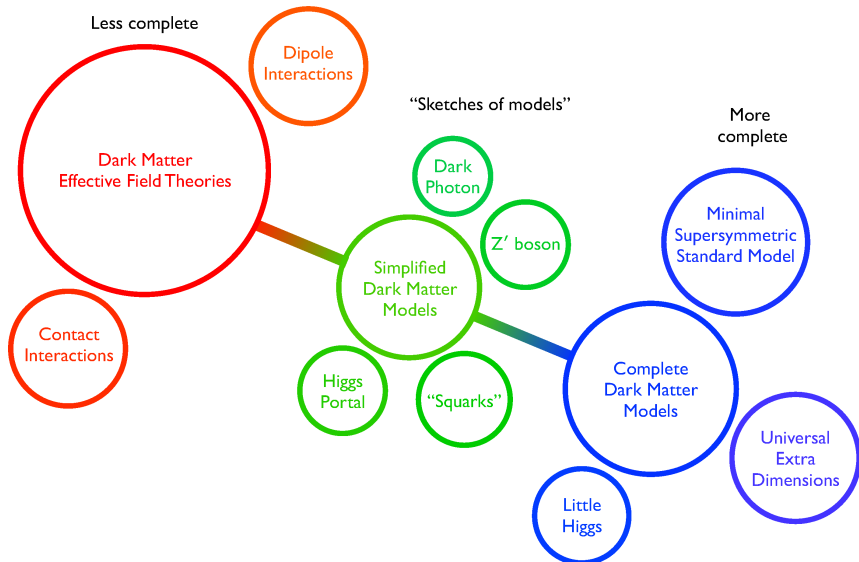

ATLAS-CONF-2016-069 (ATLAS-CONF-2016-059)

D14	$\bar{\chi}\gamma^5\chi G^{\mu\nu}\tilde{G}_{\mu\nu}$	$\alpha_s/4\Lambda^3$

- Completely general: if DM is the lightest BSM particle, any  $\mathcal{L}_{UV}$  can be reduced to  $\mathcal{L}_{SM} + \text{DM} + \text{towers of EFT operators}$
- For interaction with quarks minimum dimension is 6 (for gauge bosons, 5 for higgs)
- Only 2 parameters:  $\Lambda, m_\chi$
- Signal scales with  $\Lambda$ :

$$N_{events} = \mathcal{L}_{int} \frac{f(m_\chi)}{\Lambda^{2(d-4)}}$$

$$\mathcal{L}_{\text{EFF}} \supset \frac{(g_q \bar{q}q + g_\chi \bar{\chi}\chi)^2}{2M^2} \supset \frac{g_q g_\chi \bar{q}q \bar{\chi}\chi}{M^2} \rightarrow$$

arXiv:1307.2253, 1402.1275

# Predicting Dark Matter Signals

EFT validity Problems. From UV to EFT: propagator expansion

- Expand the UV propagator as power series

$$\frac{g_q g_\chi}{Q_{\text{tr}}^2 - M^2} = -\frac{g_q g_\chi}{M^2} \left( 1 + \frac{Q_{\text{tr}}^2}{M^2} + \mathcal{O} \left( \frac{Q_{\text{tr}}^4}{M^4} \right) \right)$$

- Compare result of UV+integrating out or UV+propagator expansion with EFT
- In both cases the two results match if

$$\frac{1}{\Lambda^2} \equiv \frac{g_\chi g_q}{M^2}$$

- This is called matching condition

# Predicting Dark Matter Signals

EFT validity Problems. EFT Validity Condition

In the latter case is easier to understand that the EFT validity requires

## Validity Condition

$$Q_{\text{tr}}^2 < M^2 = g_\chi g_q \Lambda^2$$

To ensure EFT validity, we can throw away events with  $Q_{\text{tr}}^2 > M^2$  produced by your event generator (Truncation)

## Issue 1

Validity condition depends on UV theory parameters

## Issue 2

Matching (and so validity) condition depends on the UV completion which may not be unique.

# Predicting Dark Matter Signals

EFT validity Problems. EFT Validity solution: The Truncation Method (Results)

Issue 3

Imposing EFT validity weakens exclusion limits

## Simplified Models: s-channel

$$\mathcal{L}_S = \frac{1}{2} \partial_\mu S \partial^\mu S - \frac{1}{2} M_{\text{med}}^2 S^2 - y_\chi S \bar{\chi} \chi - y_q^{ij} S \bar{q}_i q_j + \text{h.c.}$$

$$\mathcal{L}_P = \frac{1}{2} \partial_\mu S \partial^\mu S - \frac{1}{2} M_{\text{med}}^2 S'^2 - y'_\chi S' \bar{\chi} \gamma_5 \chi - y_q'^{ij} S' \bar{q}_i \gamma_5 q_j + \text{h.c.}$$

$$\mathcal{L}_V = -\frac{1}{4} F_V^{\mu\nu} F_{V,\mu\nu} - \frac{1}{2} M_{\text{med}}^2 V_\mu V^\mu - g_\chi V_\mu \bar{\chi} \gamma^\mu \chi - g_q^{ij} V_\mu \bar{q}_i \gamma^\mu q_j$$

$$\mathcal{L}_A = -\frac{1}{4} F_V^{\mu\nu} F_{V,\mu\nu} - \frac{1}{2} M_{\text{med}}^2 V'_\mu V'^\mu - g'_\chi V'_\mu \bar{\chi} \gamma^\mu \gamma_5 \chi - g_q'^{ij} V'_\mu \bar{q}_i \gamma^\mu \gamma_5 q_j$$

- MFV for  $V, A$  models requires  $g_q^{i,j} = g_q^{V/A} \delta_{i,j}$ .
- MFV for  $S, A$  models requires  $y_{u,d}^{i,j} = g_{u,d} \frac{m_i}{v} \delta_{i,j}$ . To reduce parameter space, first generation of simplified models also assumed  $g_u = g_d$ .

# Predicting Dark Matter Signals

## Simplified Models

Name	Operator	Model
D1	$\bar{\chi}\chi \bar{q}q$	$S(SS)$
D4	$\bar{\chi}\gamma^5\chi \bar{q}\gamma^5q$	$P(PP)$
D5	$\bar{\chi}\gamma_\mu\chi \bar{q}\gamma^\mu q$	$V(VV)$
D8	$\bar{\chi}\gamma_\mu\gamma^5\chi \bar{q}\gamma^\mu\gamma^5q$	$A(AA)$
D11	$\bar{\chi}\chi G^{\mu\nu}G_{\mu\nu}$	$S(SS)$

- Simplest UV-safe models that yield EFT dim-6 operators
- Replace contact interactions with propagating degrees of freedom
- Scalar (and pseudoscalar) also introduce dim-7 operator with gluons through top loop
- D2,D3,D6,D7 can also be reproduced, by changing the coupling structure
- All other EFT dim-6 and 7 operators arise at loop level in such models

# Predicting Dark Matter Signals

## Simplified Models: t-channel

$$\mathcal{L} = \mathcal{L}_{SM} + \sum_{i,j=1,2,3} g^{i,j} \left( \tilde{Q}_L^i \bar{Q}_L^j + \tilde{u}_R^i \bar{u}_R^j + \tilde{d}_R^i \bar{d}_R^j \right) \chi + \text{h.c.} \quad (2)$$

- Require multiple scalar propagators  $\tilde{Q}_L^i, \tilde{u}_R^i, \tilde{d}_R^i$
- Propagators are colored
- Either propagators (MSSM) or DM (flavored-DM) are flavored
- MFV requires  $g^{i,j} = g_t \delta_{i,j}$
- Approximate MFV, given  $y_t \gg y_{u,c}$ , only requires  $g^{i,j} = g_{t,i} \delta_{i,j}, \quad g_{t,1} = g_{t,2} \neq g_{t,3}$

  - Simplified Models
  - **Simplified Models: consistency**
  - Simplified Models: complementarity
- 4 Summary
  - Conclusions

# Predicting Dark Matter Signals

Simplified Models: consistency (s-ch)

- A full UV consistent theory, features: only  $dim \leq 4$  interactions, gauge invariance  $\longleftrightarrow$  renormalizable, anomaly-free
  - ✓ Simplified models have only  $dim \leq 4$  interactions
  - ✓ Simplified models do not care of anomalies, as one can always assume that additional fermions to cancel the anomalies exist but have much larger masses
  - ✗ Simplified models listed before are not (all) gauge invariant
- Models are invariant only under  $SU(3)_c \times U(1)_{em}$ , but not under  $SU(2)_L \times U(1)_Y$ , neither under  $U(1)_{dark}$  in  $V, A$  models
  - $V, A$  models have a massive gauge boson whose mass term is not G.I.
  - $S, P$  models have  $\bar{q}q$  terms that are not G.I.

# Predicting Dark Matter Signals

Simplified Models: consistency V/A models

- For pure vector couplings to both quarks and DM, the mass term for  $V$  is indeed G.I., gauge invariance is hidden (Stuckelberg Mechanism)
- In all other cases, if any particle has an axial coupling to  $V$ , one needs to add a Dark higgs Boson  $\phi$ 
  - The dark higgs will in general mix with the SM higgs  $\Phi$  through a  $\Phi\Phi^\dagger\phi\phi^\dagger$  term
  - If quarks have axial charge, the SM higgs is charged under the new  $U(1)$ , implying that the SM  $Z$  boson is mixing with  $V$
  - If DM has axial couplings, DM can only get a mass through  $\phi$ . The dark yukawa coupling will be  $y_\chi \propto \frac{g_q m_\chi}{M_{med}} \leq \sqrt{4\pi}$ . Moreover this means that there are 2 mediators connecting dark and visible sectors:  $V$  and  $\phi$ .  $V$  and  $Z$  will anyway mix at loop level.

# Predicting Dark Matter Signals

Simplified Models: consistency S/P models

- To restore gauge invariance, one needs quarks to couple to an higgs-like doublet, and the scalar of the new doublet to mix with a gauge singlet, and the singlet coupling to DM
  - Minimal option: SM higgs mixing with a new gauge singlet scalar (mixing angle severely constrained  $\rightarrow$  tiny signal). Moreover, also leptons are forced to couple to the new scalar with  $g_l = g_q$ , giving stringent constraints from di-lepton resonances.
  - Next-to-minimal option: New higgs doublet mixing with a new gauge singlet scalar (THDM)

# Predicting Dark Matter Signals

Simplified Models: complementarity

## Warning!!!

- Simplified models are **NOT** complete models, they are just thought to be a tool to analyse LHC data for certain searches.
- Some models may have been thought for a particular search, and may be fine to be used for that search, but not for others
- Using simplified models in contexts different from LHC means making **several assumptions**, i.e. that physics at LHC energy scale and DD/ID energy scales is affected by the same subset of particles/interactions of the underlying UV theory

# Predicting Dark Matter Signals

## Simplified Models: complementarity. Direct Detection

Name	Operator	Model	$\sigma$	Suppression
D1	$\bar{\chi}\chi \bar{q}q$	$SS$	SI	$\frac{m_N}{v}$
D2	$\bar{\chi}\gamma^5\chi \bar{q}q$	$SP$	SI	$q^2, \frac{v}{m_N}$
D3	$\bar{\chi}\chi \bar{q}\gamma^5q$	$PS$	SD	$q^2, \frac{v}{m_N}$
D4	$\bar{\chi}\gamma^5\chi \bar{q}\gamma^5q$	$PP$	SD	$q^4, \frac{m_N}{v}$
D5	$\bar{\chi}\gamma_\mu\chi \bar{q}\gamma^\mu q$	$VV$	SI	-
D6	$\bar{\chi}\gamma_\mu\gamma^5\chi \bar{q}\gamma^\mu q$	$VA$	SI+SD	$v_r^2(SI)q^2(SD)$
D7	$\bar{\chi}\gamma_\mu\chi \bar{q}\gamma^\mu\gamma^5q$	$AV$	SD	$q^2 + v_r^2$
D8	$\bar{\chi}\gamma_\mu\gamma^5\chi \bar{q}\gamma^\mu\gamma^5q$	$AA$	SD	-
D11	$\bar{\chi}\chi G^{\mu\nu}G_{\mu\nu}$	$SS$	SI	$\frac{m_N}{v}$

- Spin structure of couplings very important for DD
- SI: usually assumes isospin conservation
- SD: constraints for  $\sigma_p$  and  $\sigma_n$

# Predicting Dark Matter Signals

## Simplified Models: complementarity. Direct Detection

- Bounds

$M_{med} > M_{med}^{min}(m_\chi)$  can be translated in bounds on  $\sigma_{SI/SD} < \sigma(m_\chi)$  by using the EFT limit with proper matching, for example

$$\frac{1}{\Lambda^2} = \frac{g_q g_\chi}{M_{med}^2}$$

- When taking EFT limit, matching is not enough, one also needs to run the couplings from LHC energy scale to DD energy scale

1605.04917

# Predicting Dark Matter Signals

Simplified Models: complementarity. Indirect Detection/Relic Density

Name	Model	s-wave
D1	$SS$	No
D2	$SP$	Yes
D3	$PS$	No
D4	$PP$	Yes
D5	$VV$	Yes
D6	$VA$	No
D7	$AV$	Yes
D8	$AA$	$m_q^2/m_\chi^2$
D11	$SS$	No

- Away from resonance ( $M_{med} = 2m_\chi$ ) can expand  $\sigma v = a + bv^2 + \mathcal{O}(v^4)$
- $\langle\sigma v\rangle = a + b\langle v^2\rangle$  with  $\langle v^2\rangle \sim T/m_\chi \sim \mathcal{O}(0.03)$
- If  $a = 0$  or  $a \ll b$  (no or suppressed s-wave) annihilation is suppressed
- $\Omega_\chi \sim 0.118 \frac{3 \times 10^{26} \text{ cm}^3/\text{s}}{\langle\sigma v\rangle}$

## Actung!!!

There are many ways to enhance or suppress DM relic abundance, by adding additional particles at the model for example (not relevant for DD, LHC). Examples: secluded models (fix overabundance), multi-component DM (fix underabundance)

- Resonance region ( $M_{med} \sim 2m_{DM}$ )
- Annihilation to mediator closed (low  $m_{DM}$ , high  $M_{med}$ )
- Annihilation to top open ( $m_{DM} > m_t$ )

# Predicting Dark Matter Signals

Simplified Models: complementarity. Indirect Detection/Relic Density

- 1 Introduction
  - Evidence for DM
  - $\Lambda$ CDM model
  - DM Candidates
- 2 Dark Matter at Collider
  - Collider Introduction
  - Dark Matter signatures
- 3 Predicting Dark Matter Signals
  - Effective Field theories (EFT)
  - EFT validity Problems
  - Simplified Models

  - Conclusions

# Summary

## Conclusions

- Plenty of evidence for DM
- Plenty of DM candidates, large mass range
- Plenty of ways to search for DM
- DM at collider: EFT not a good description
- Simplified Models the current best-motivated tool
- They allow more phenomenology, and complementarity
- Possibility to combine different searches, with care
