

Status of the TDataFrame sprint

D. Piparo (EP-SFT)

A Plan in JIRA

- A story is available here [ROOT-8754](#)

Input from Vassil

- Vassil on board: involved in the discussions, reviewing PRs, contributing to future benchmarking

Comments for 6.10:

- Names could be better, e.g. less implementation details exposed in them
 - Overcome the Server/Client names: misleading b/c of http server and net library
 - Go for `DiscriminateFileBlockAllocator` or smth like this?
- Move the header files where they belong semantically, i.e. `root/io/io`
- Add in-tree gtests to test usecases the initial implementation is supposed to cover
- Avoid to bring in the queue header as is (reuse something exists perhaps enhanced?)

Future Evolution:

Perhaps we want to investigate could we reuse the splitting mechanism to allocate discriminate chunks of storage?
