Harbinger of New Physics

Non-zero neutrino mass \implies physics beyond the SM

- Something beyond the EW Higgs mechanism?
- A natural way is by breaking the $(B - L)$ -symmetry of the SM.
- Dimension-5 operator $(LLHH)/\Lambda$. [Weinberg (PRL '79)]
- Tree-level realization: **Seesaw mechanism**

Can the seesaw mechanism be ever tested experimentally?

- Look for *all* possible signatures (*leave no stone unturned*).

Origin of $B - L$ breaking

Local $B - L$ symmetry

- The corresponding Higgs field will have a physical neutral scalar component.
- Could provide important clues to the physics of neutrino mass.
- Experimentally realistic only if $B - L$ breaking scale is within multi-TeV.
- Mass of the new Higgs field is still largely unrestricted.
- Important to scan over the entire allowed range.

Origin of $B - L$ breaking

Local $B - L$ symmetry

- The corresponding Higgs field will have a physical neutral scalar component.
- Could provide important clues to the physics of neutrino mass.
- Experimentally realistic only if $B - L$ breaking scale is within multi-TeV.
- Mass of the new Higgs field is still largely unrestricted.
- Important to scan over the entire allowed range.
- For mass $\gg m_h$, production at colliders is (typically) kinematically suppressed. (Many studies on heavy Higgs searches)
- For masses $\sim m_h$, potentially large mixing with the SM Higgs (disfavored by the LHC Higgs data).
- Our focus here will be on the mass range $\ll m_h$ (largely unexplored so far).

Left-Right Symmetric Model

- Provides a natural framework for (type-I) seesaw embedding.
- Based on the gauge group $SU(2)_L \times SU(2)_R \times U(1)_{B-L}$. [Pati, Salam (PRD '74); Mohapatra, Pati (PRD '75); Senjanović, Mohapatra (PRD '75)]
- Minimal scalar sector:

$$SU(2)_L \times SU(2)_R \times U(1)_{B-L}$$

$$\Downarrow \Delta_R(\mathbf{1}, \mathbf{3}, 2)$$

$$SU(2)_L \times U(1)_Y$$

$$\Downarrow \Phi(\mathbf{2}, \mathbf{2}, 0)$$

$$U(1)_{EM}$$

$$\left(\begin{array}{cc} \frac{1}{\sqrt{2}}\Delta_R^+ & \Delta_R^{++} \\ \Delta_R^0 & -\frac{1}{\sqrt{2}}\Delta_R^+ \end{array} \right) \Rightarrow H_3^0, H_2^{\pm\pm}$$

$$\left(\begin{array}{cc} \phi_1^0 & \phi_2^+ \\ \phi_1^- & \phi_2^0 \end{array} \right) \Rightarrow h, H_1^0, A_1^0, H_1^\pm$$

Left-Right Symmetric Model

- Provides a natural framework for (type-I) seesaw embedding.
- Based on the gauge group $SU(2)_L \times SU(2)_R \times U(1)_{B-L}$. [Pati, Salam (PRD '74); Mohapatra, Pati (PRD '75); Senjanović, Mohapatra (PRD '75)]
- Minimal scalar sector:

$$SU(2)_L \times SU(2)_R \times U(1)_{B-L}$$

$$\Downarrow \Delta_R(\mathbf{1}, \mathbf{3}, 2)$$

$$SU(2)_L \times U(1)_Y$$

$$\Downarrow \Phi(\mathbf{2}, \mathbf{2}, 0)$$

$$U(1)_{EM}$$

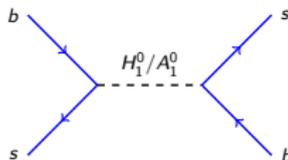

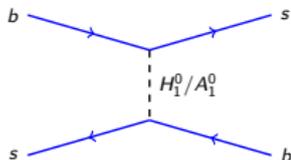

$$\left(\begin{array}{cc} \frac{1}{\sqrt{2}} \Delta_R^+ & \Delta_R^{++} \\ \Delta_R^0 & -\frac{1}{\sqrt{2}} \Delta_R^+ \end{array} \right) \Rightarrow H_3^0, H_2^{\pm\pm}$$

$$\left(\begin{array}{cc} \phi_1^0 & \phi_2^+ \\ \phi_1^- & \phi_2^0 \end{array} \right) \Rightarrow h, H_1^0, A_1^0, H_1^\pm$$

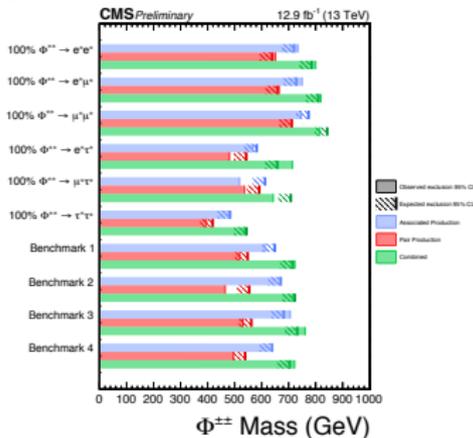

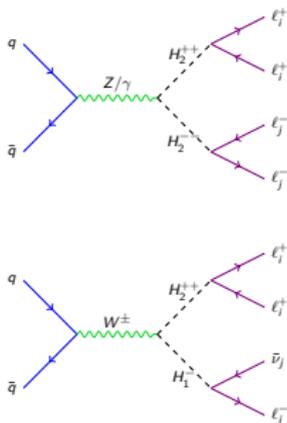

- Eight physical scalars with rich phenomenology. [Gunion, Grifols, Mendez, Kayser, Olness (PRD '89); Bambhaniya, Chakraborty, Gluza, Jeliński, Kordiaczyńska (PRD '14, '15); Dutta, Eusebi, Gao, Ghosh, Kamon (PRD '14); BD, Mohapatra, Zhang (JHEP '16);...]
- Left-handed Δ_L is decoupled from the TeV scale physics. [Chang, Mohapatra, Parida (PRL '84), Deshpande, Gunion, Kayser, Olness (PRD '91)]
- Allows gauge coupling $g_R \neq g_L$ at the TeV scale.

Constraints on the scalars

- FCNC limits on bidoublet mass: $M_{H_1^0, A_1^0, H_1^\pm} \gtrsim 10 \text{ TeV}$ [Zhang, An, Ji, Mohapatra (NPB '07); Bertolini, Maiezza, Nesti (PRD '14)]

- LHC limits on doubly-charged scalar: $M_{H_2^{\pm\pm}} \gtrsim 500 \text{ GeV}$

- Almost no limit on the neutral scalar H_3 (before our work).

Scalar Potential

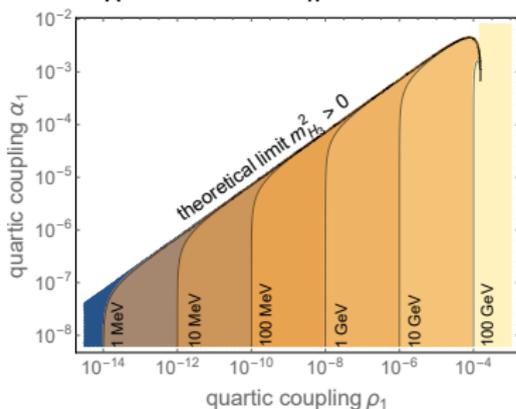

$$\begin{aligned} V(\Phi, \Delta_R) = & -\mu_1^2 \text{Tr}(\Phi^\dagger \Phi) - \mu_2^2 \left[\text{Tr}(\tilde{\Phi} \Phi^\dagger) + \text{Tr}(\tilde{\Phi}^\dagger \Phi) \right] - \mu_3^2 \text{Tr}(\Delta_R \Delta_R^\dagger) \\ & + \lambda_1 \left[\text{Tr}(\Phi^\dagger \Phi) \right]^2 + \lambda_2 \left\{ \left[\text{Tr}(\tilde{\Phi} \Phi^\dagger) \right]^2 + \left[\text{Tr}(\tilde{\Phi}^\dagger \Phi) \right]^2 \right\} \\ & + \lambda_3 \text{Tr}(\tilde{\Phi} \Phi^\dagger) \text{Tr}(\tilde{\Phi}^\dagger \Phi) + \lambda_4 \text{Tr}(\Phi^\dagger \Phi) \left[\text{Tr}(\tilde{\Phi} \Phi^\dagger) + \text{Tr}(\tilde{\Phi}^\dagger \Phi) \right] \\ & + \rho_1 \left[\text{Tr}(\Delta_R \Delta_R^\dagger) \right]^2 + \rho_2 \text{Tr}(\Delta_R \Delta_R) \text{Tr}(\Delta_R^\dagger \Delta_R^\dagger) \\ & + \alpha_1 \text{Tr}(\Phi^\dagger \Phi) \text{Tr}(\Delta_R \Delta_R^\dagger) + \left[\alpha_2 e^{i\delta_2} \text{Tr}(\tilde{\Phi}^\dagger \Phi) \text{Tr}(\Delta_R \Delta_R^\dagger) + \text{H.c.} \right] \\ & + \alpha_3 \text{Tr}(\Phi^\dagger \Phi \Delta_R \Delta_R^\dagger). \end{aligned}$$

Light neutral scalar H_3

- Mixing with the SM Higgs

$$\mathcal{M}_{h,H_3}^2 = \begin{pmatrix} 4\lambda_1\epsilon^2 & 2\alpha_1\epsilon \\ 2\alpha_1\epsilon & 4\rho_1 \end{pmatrix} v_R^2 \implies \sin\theta_1 \simeq \frac{\alpha_1}{2\lambda_1} \frac{v_R}{v_{EW}}$$

- Tree-level mass: $m_{H_3}^2 \simeq 4\rho_1 v_R^2 - \sin^2\theta_1 m_h^2$.

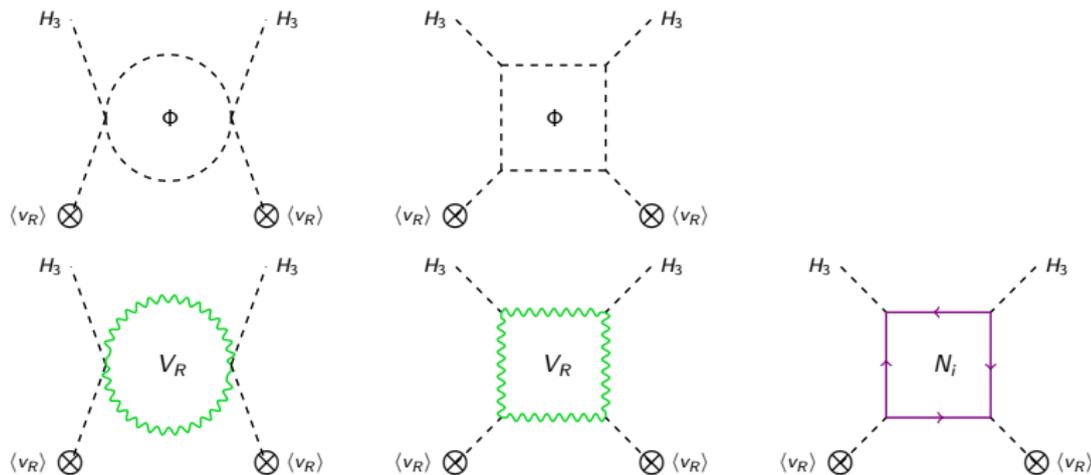

- Mixing with the heavy doublet scalar H_1 : $\sin\theta_2 \simeq \frac{4\alpha_2}{\alpha_3} \frac{v_{EW}}{v_R}$.
- H_3 talks to the SM particles via
 - mixing angles $\sin\theta_{1,2}$: hadrons, l^+l^- , $\gamma\gamma$;
 - RH gauge (and scalar) coupling: $\gamma\gamma$ [through the W_R (also H_1^\pm , $H_2^{\pm\pm}$) loop].

Radiative Effects

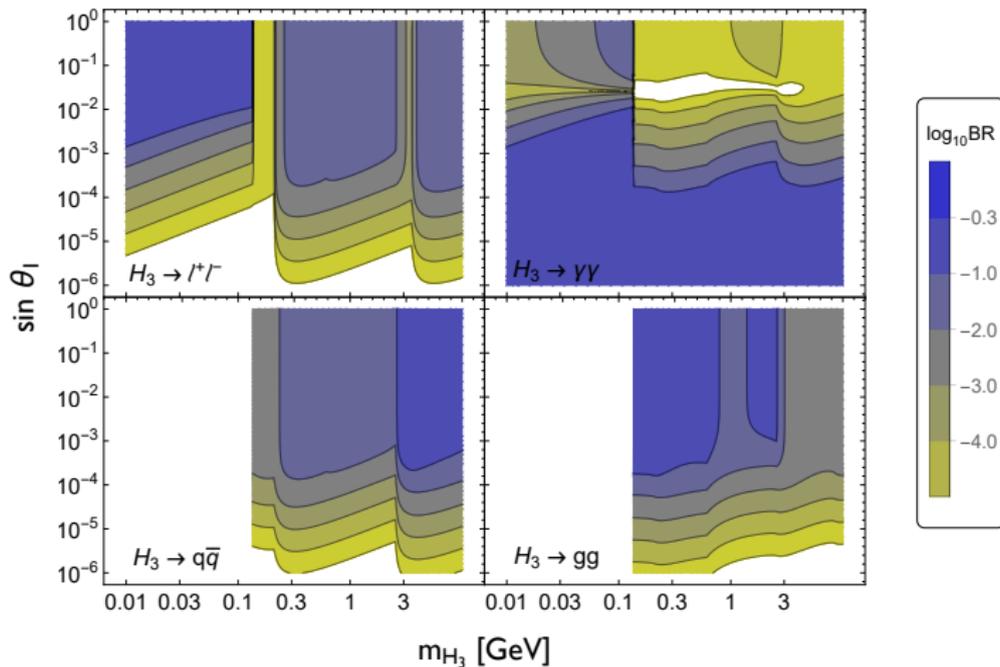

- Mass dependence on the parameters at the 1-loop level

$$(m_{H_3}^2)^{\text{loop}} \simeq \frac{3}{2\pi^2} \left[\frac{1}{3}\alpha_3^2 + \frac{8}{3}\rho_2^2 - 8f^4 + \frac{1}{2}g_R^4 + (g_R^2 + g_{BL}^2)^2 \right] v_R^2$$

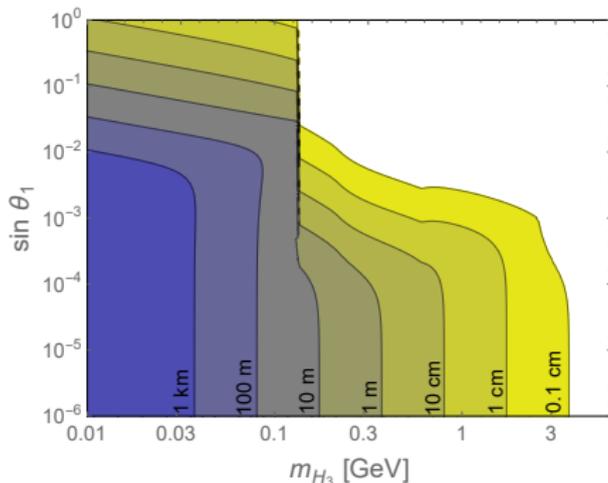

For $m_{H_3} \sim \text{GeV}$ and $v_R \simeq \text{few TeV}$, the parameters above are tuned at the level of $\sim \text{GeV} / \frac{v_R}{4\pi} \simeq 10^{-2}$.

Branching ratios

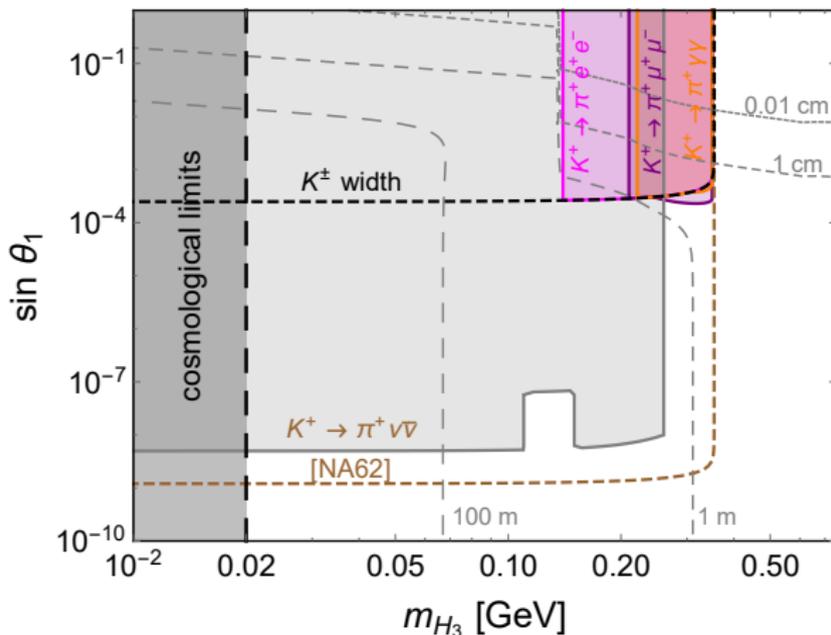

Decay Length

- The mixing angles $\sin \theta_{1,2}$ are required to be very small ($\lesssim 10^{-4}$) by the meson oscillation and rare decay constraints.
- Make H_3 long-lived with dominant decay mode as $H_3 \rightarrow \gamma\gamma$ (via W_R loop).
- Displaced diphoton signal at the LHC.
- For lower masses, sufficiently long-lived to escape the ECAL of LHC detectors.
- Suitable to search for at the lifetime frontier: **MATHUSLA** (MAssive Timing Hodoscope for Ultra-Stable Neutral PArticles) [Chou, Curtin, Lubati (PLB '16)]

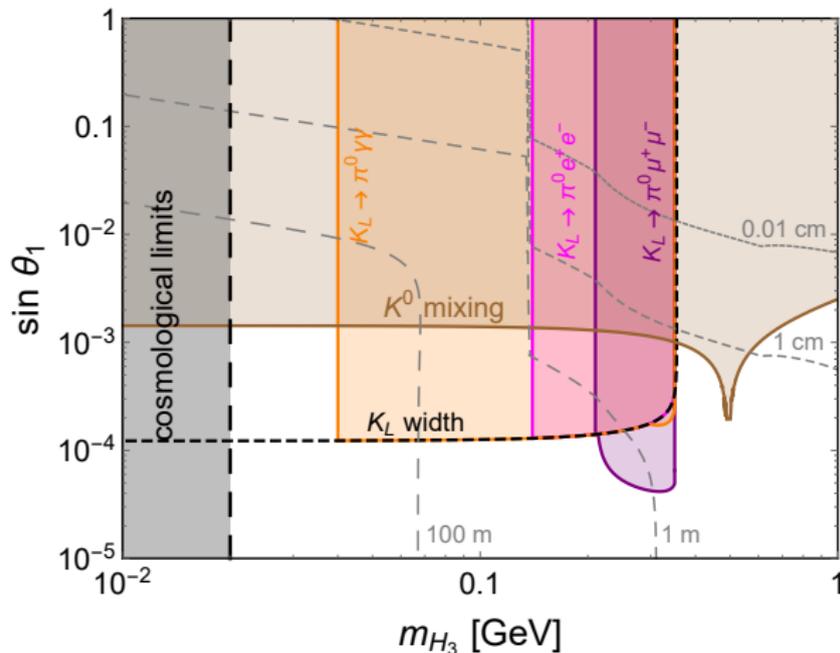

K^\pm meson limits

K^\pm width limits from 20% of $\Gamma_{\text{total}}(K^\pm)$

$K^\pm \rightarrow \pi^\pm e^+ e^-$:	NA48/2 ['09]	$K^\pm \rightarrow \pi^\pm \nu \bar{\nu}$:	E949 ['09]
$K^\pm \rightarrow \pi^\pm \mu^+ \mu^-$:	NA48/2 ['11]	$K^\pm \rightarrow \pi^\pm \nu \bar{\nu}$:	NA62 (prosepects)
$K^\pm \rightarrow \pi^\pm \gamma \gamma$:	NA62 ['14]		

K^0 meson limits

$K^0 - \bar{K}^0$ mixing limits from 50% of experimental central value [1.74×10^{-12} MeV]

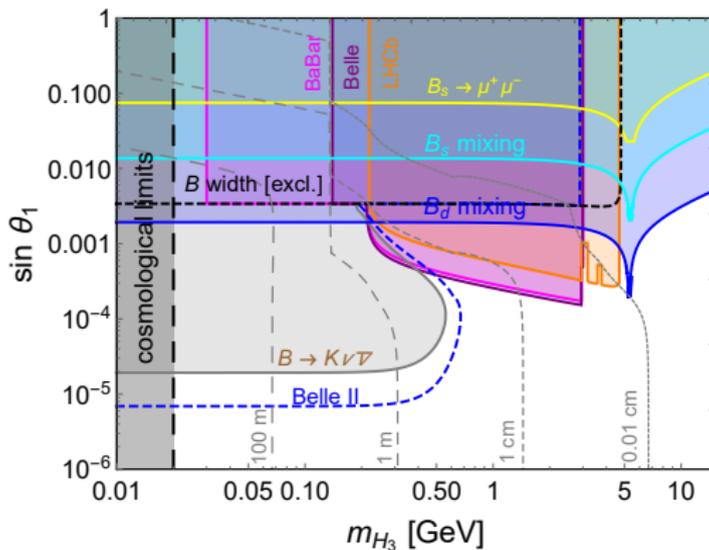

K_L width limits from 20% of $\Gamma_{\text{total}}(K_L)$

$K_L \rightarrow \pi^0 e^+ e^-$: KTeV ['03]

$K_L \rightarrow \pi^0 \mu^+ \mu^-$: KTeV ['00]

$K_L \rightarrow \pi^0 \gamma \gamma$: KTeV ['08]

B meson limits

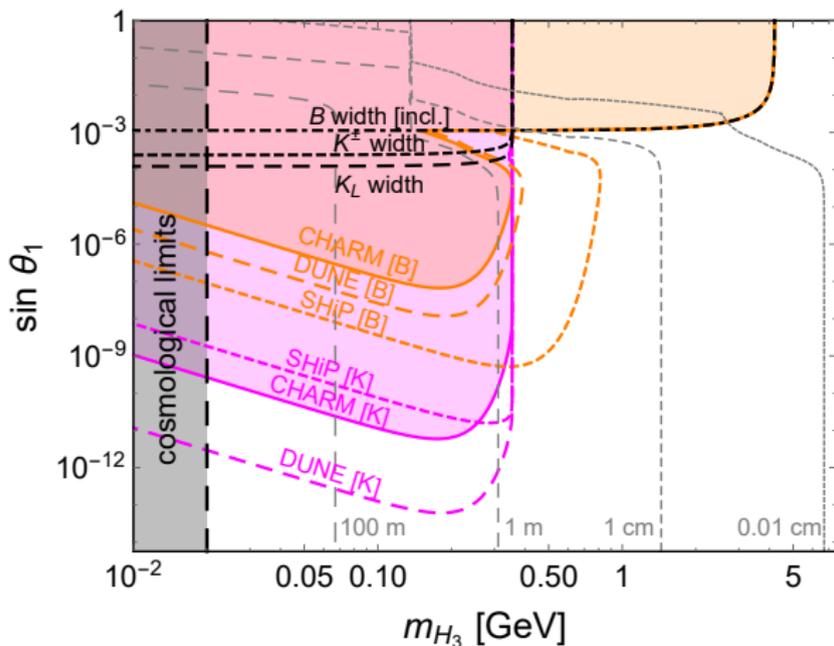

$B_{d(s)} - \bar{B}_{d(s)}$ mixing limits from CKM fitter $[9.3 (2.7) \times 10^{-11(9)} \text{ MeV}]$

B width limits from 20% of $\Gamma_{\text{total}}(B)$

$B \rightarrow K \ell^+ \ell^-$:	BaBar ['03], Belle ['09], LHCb ['12]
$B \rightarrow K \nu \bar{\nu}$:	BaBar ['13], Belle II (prospects)
$B_s \rightarrow \mu^+ \mu^-$:	LHCb ['17]
$B_{d(s)} \rightarrow \gamma \gamma$:	BaBar (Belle) ['10 ('14)]
$\Upsilon \rightarrow \gamma H_3$:	BaBar ['11]

Beam dump experiments

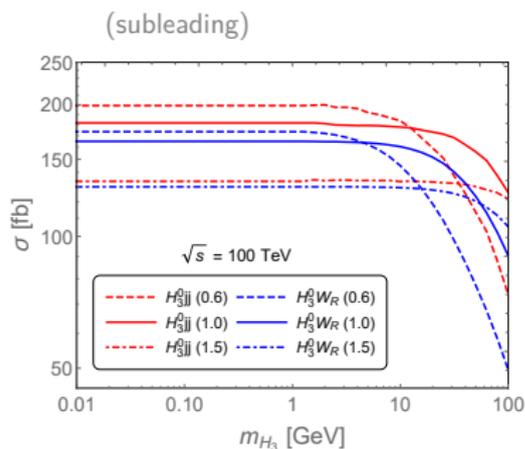

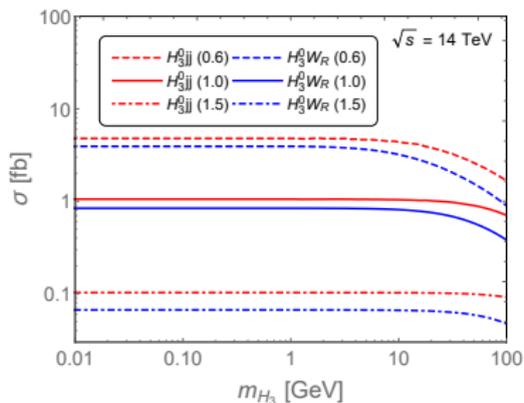

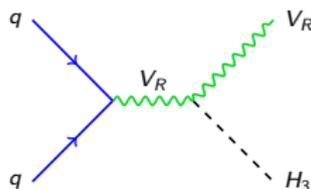

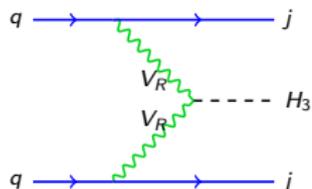

$$\begin{aligned}
 \text{CHARM} : N_{\text{PoT}} &= 2.4 \times 10^{18} &\Rightarrow & 1.2 \times 10^{17} K, & 2.6 \times 10^{10} B \\
 \text{SHiP} : N_{\text{PoT}} &= 2 \times 10^{20} &\Rightarrow & 8 \times 10^{18} K, & 7 \times 10^{13} B \\
 \text{DUNE} : N_{\text{PoT}} &= 5 \times 10^{21} &\Rightarrow & 7.8 \times 10^{21} K, & 5.5 \times 10^{12} B
 \end{aligned}$$

Production at LHC (and FCC-hh)

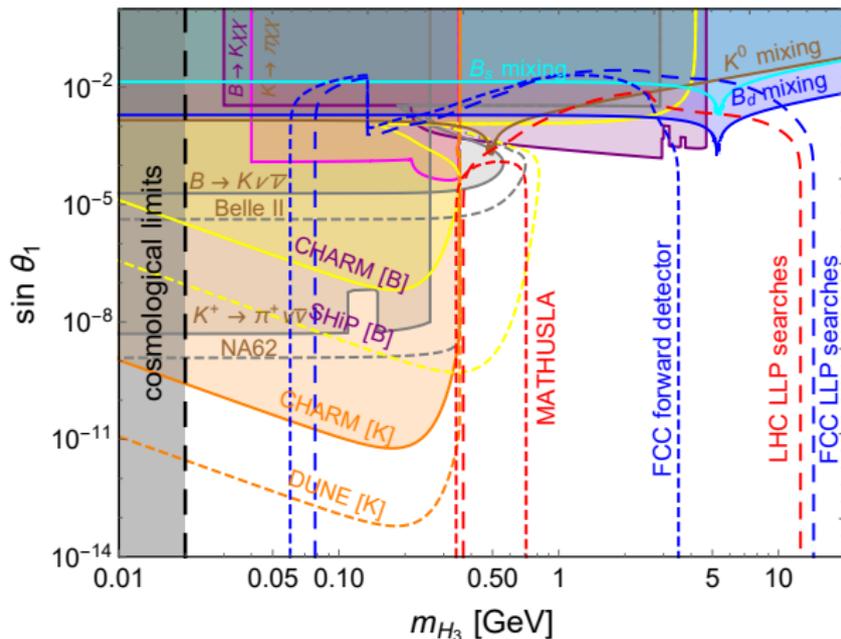

- SM Higgs portal highly suppressed by $\sin \theta_1$:

$$pp \rightarrow h^{(*)} \rightarrow hH_3/H_3H_3 \quad (\propto \sin \theta_1)$$

- Heavy VBF production & associated production:

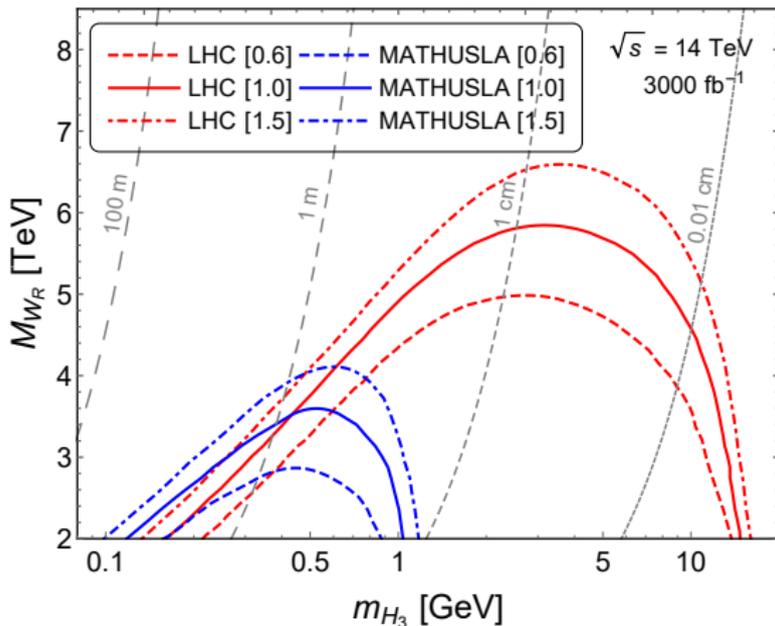

Energy-Intensity frontier complementarity

LLP searches at high-energy colliders are largely complementary to the meson decay and beam-dump experiments.

L-R seesaw sensitivity

Complementary to the like-sign dilepton searches, which constrain the $M_N - M_{W_R}$ parameter space.

Conclusion

- Light scalar (~ 0.1 to 10 GeV) in minimal left-right model: *neutral component from $SU(2)_R$ -triplet (hadrophobic)*
- Mixings to SM Higgs and heavy doublet are constrained to be small (from FCNC).
- $H_3 \rightarrow \gamma\gamma$ is the dominant decay mode (via W_R loop).
- Necessarily long-lived particle with distinct diphoton signal.
- **Unique to the L-R seesaw** (though light H_3 can be long-lived in generic $U(1)_{B-L}$ models).
- Energy-intensity frontier complementarity.

A new probe of the origin of neutrino mass mechanism

Physical scalar masses

Assume CP conservation and

$$\xi \equiv \langle \phi_2^0 \rangle / \langle \phi_1^0 \rangle = \kappa' / \kappa \simeq m_b / m_t \ll 1,$$

$$\epsilon \equiv v_{EW} / v_R = \sqrt{\kappa^2 + \kappa'^2} / v_R \ll 1$$

scalars	components	mass squared
h	$\sim \phi_1^{0 \text{ Re}}$	$\left(4\lambda_1 - \frac{\alpha_1^2}{\rho_1 - \lambda_1} \right) \kappa^2$
H_1^0	$\sim \phi_2^{0 \text{ Re}}$	$\alpha_3(1 + 2\xi^2)v_R^2 + 4 \left(2\lambda_2 + \lambda_3 + \frac{4\alpha_2^2}{\alpha_3 - 4\rho_1} \right) \kappa^2$
A_1^0	$\sim \phi_2^{0 \text{ Im}}$	$\alpha_3(1 + 2\xi^2)v_R^2 + 4(\lambda_3 - 2\lambda_2) \kappa^2$
H_1^\pm	$\sim \phi_2^\pm$	$\alpha_3(1 + 2\xi^2)v_R^2 + \frac{1}{2}\alpha_3\kappa^2$
H_3^0	$\sim \Delta_R^{0 \text{ Re}}$	$4\rho_1 v_R^2 + \left(\frac{\alpha_1^2}{\rho_1} - \frac{16\alpha_2^2}{\alpha_3 - 4\rho_1} \right) \kappa^2$
$H_2^{\pm\pm}$	$\sim \Delta_R^{\pm\pm}$	$4\rho_2 v_R^2 + \alpha_3 \kappa^2$

Bidoublet scalars

Almost degenerate masses

Triplet scalars

Couple to quarks only through mixings:

Hadrophobic states

- All the couplings to SM quarks and leptons are proportional to the linear combinations of $\sin \theta_{1,2}$.
- Heavy particle loops for $H_3 \rightarrow \gamma\gamma$ suppressed by v_{EW}/v_R .

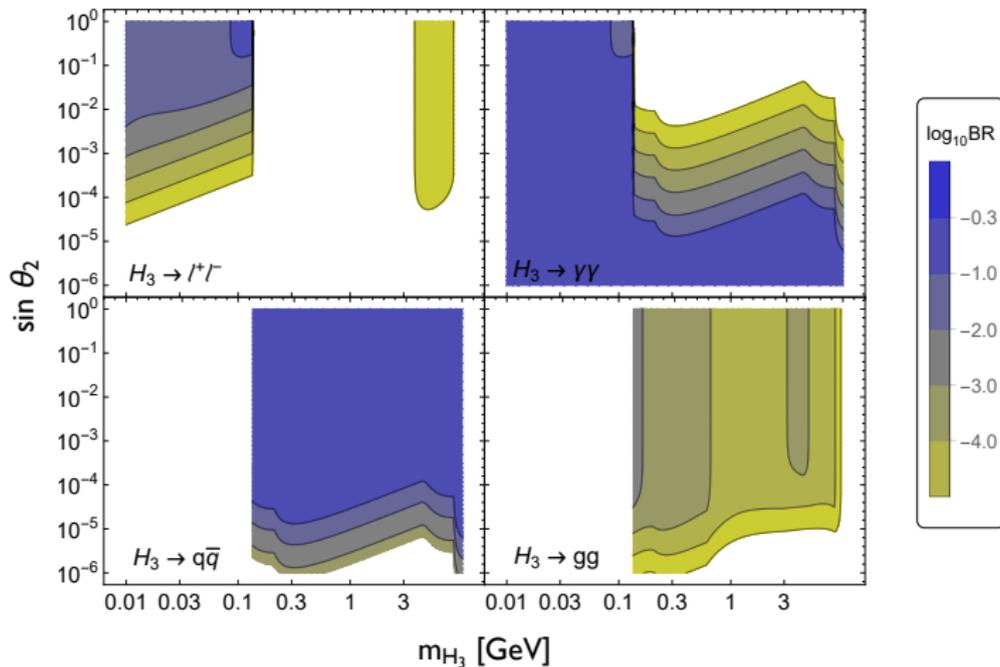

$$\Gamma(H_3 \rightarrow q\bar{q}) = \frac{3m_{H_3}}{16\pi} \left[\sum_{i,j} |\mathcal{Y}_{u,ij}|^2 \beta_2^3(m_{H_3}, m_{u_i}, m_{u_j}) \Theta(m_{H_3} - m_{u_i} - m_{u_j}) + \sum_{i,j} |\mathcal{Y}_{d,ij}|^2 \beta_2^3(m_{H_3}, m_{d_i}, m_{d_j}) \Theta(m_{H_3} - m_{d_i} - m_{d_j}) \right],$$

$$\Gamma(H_3 \rightarrow \ell^+ \ell^-) = \frac{m_{H_3}}{16\pi} \sum_{i,j} |\mathcal{Y}_{e,ij}|^2 \beta_2^3(m_{H_3}, m_{e_i}, m_{e_j}) \Theta(m_{H_3} - m_{e_i} - m_{e_j}),$$

$$\Gamma(H_3 \rightarrow \gamma\gamma) = \frac{\alpha^2 m_{H_3}^3}{1024\pi^3} \left| \frac{\sqrt{2}}{v_R} A_0(\tau_{H_1^\pm}) + \frac{4\sqrt{2}}{v_R} A_0(\tau_{H_2^\pm\pm}) + \frac{\sqrt{2}}{v_{EW}} \sum_{f=q,\ell} f_f N_C^f Q_f A_{1/2}(\tau_f) + \frac{\sqrt{2}}{v_R} A_1(\tau_{WR}) \right|^2, \quad \begin{cases} A_0(0) = 1/3 \\ A_1(0) = -7 \end{cases}$$

$$\Gamma(H_3 \rightarrow gg) = \frac{G_F \alpha_s^2(m_{H_3}) m_{H_3}^3}{36\sqrt{2}\pi^3} \left| \frac{3}{4} \sum_{f=q} f_f A_{1/2}(\tau_f) \right|^2,$$

Branching ratios

K (and B) meson mixing

- “Effective” FCNC coupling for $K^0 - \bar{K}^0$ mixing

from mixing with heavy doublet scalar H_1 and SM Higgs h

$$\mathcal{L}_{H_3} = \frac{G_F}{4\sqrt{2}} \frac{\sin^2 \tilde{\theta}_2}{m_K^2 - m_{H_3}^2 + im_{H_3} \Gamma_{H_3}} \times \left[\left(\sum_i m_i \lambda_i^{RL} \right)^2 \mathcal{O}_2 + \left(\sum_i m_i \lambda_i^{LR} \right)^2 \tilde{\mathcal{O}}_2 + 2 \left(\sum_i m_i \lambda_i^{LR} \right) \left(\sum_i m_i \lambda_i^{RL} \right) \mathcal{O}_4 \right]$$

$$\sin \tilde{\theta}_2 \equiv \sin \theta_2 + \xi \sin \theta_1, \quad \left[\xi = \langle \phi_2^0 \rangle / \langle \phi_1^0 \rangle, \quad h - H_1 \text{ mixing} \right]$$

$$\mathcal{O}_2 = [\bar{s}(1 - \gamma_5)d][\bar{s}(1 - \gamma_5)d],$$

$$\tilde{\mathcal{O}}_2 = [\bar{s}(1 + \gamma_5)d][\bar{s}(1 + \gamma_5)d],$$

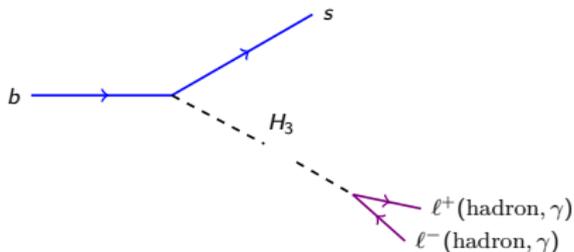

$$\mathcal{O}_4 = [\bar{s}(1 - \gamma_5)d][\bar{s}(1 + \gamma_5)d].$$

$$m_i = \{m_u, m_c, m_t\}, \quad \lambda_i^{LR} = V_{L,i2}^* V_{R,i1}, \quad \lambda_i^{RL} = V_{R,i2}^* V_{L,i1}$$

- “Resonance” effect when m_{H_3} is close to the Kaon mass:

$$\frac{1}{q^2 - m_{H_3}^2 + im_{H_3} \Gamma_{H_3}} \rightarrow \frac{1}{q^2} \simeq \frac{1}{m_K^2}$$

Flavor-changing meson decay

- Stringent limits from the down-type quark sector

$$K \rightarrow \pi\chi\chi, \quad B \rightarrow K\chi\chi, \quad [\chi = \text{hadron}, \ell, \gamma]$$

- “Visible decays”: H_3 decaying **inside detector spatial resolution**

$$d_j \rightarrow d_i H_3, \quad H_3 \rightarrow \chi\chi$$

- “Invisible decays”: H_3 decaying **outside detector size**

$$d_j \rightarrow d_i H_3, \quad H_3 \rightarrow \text{any} (L_{H_3} > R_{\text{detector}})$$

List of meson decay limits
