The problem

$t - \bar{t}$ like BSM events

Goal: To find $m_{\tilde{t}}$, $m_{\tilde{W}}$, and $m_{\tilde{\nu}}$
Subgoal: To find $m_{\tilde{t}}$ and $m_{\tilde{W}}$, given $m_{\tilde{\nu}}$

The problem

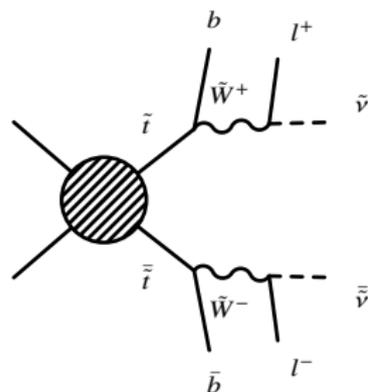

The following analyses were performed on on-shell events at LHC energy with the following mass spectrum

$$m_{\tilde{t}} = 1000 \text{ GeV}, m_{\tilde{W}} = 800 \text{ GeV}, m_{\tilde{\nu}} = 700 \text{ GeV}$$

This will be referred to as the *true* mass spectrum.

Particles in the two branches
have the same masses

$$p_{\nu}^2 = p_{\bar{\nu}}^2$$

$$(p_{\nu} + p_{l^+})^2 = (p_{\bar{\nu}} + p_{l^-})^2$$

$$(p_{\nu} + p_{l^+} + p_b)^2 = (p_{\bar{\nu}} + p_{l^-} + p_{\bar{b}})^2$$

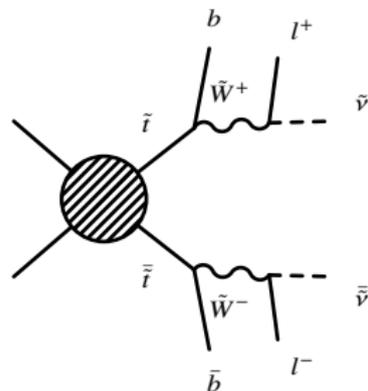

MET condition

$$\vec{p}_{\nu,T} + \vec{p}_{\bar{\nu},T} = \vec{p}_{\cancel{T}}$$

8 unknown momentum components, 5 constraints

Introduce test masses $\tilde{m}_{\tilde{l}}$, $\tilde{m}_{\tilde{W}}$, $\tilde{m}_{\tilde{\nu}}$

Particles in the two branches
have the same masses

$$p_\nu^2 = p_{\bar{\nu}}^2 = \tilde{m}_{\bar{\nu}}^2$$

$$(p_\nu + p_{l^+})^2 = (p_{\bar{\nu}} + p_{l^-})^2 = \tilde{m}_{\tilde{W}}^2$$

$$(p_\nu + p_{l^+} + p_b)^2 = (p_{\bar{\nu}} + p_{l^-} + p_{\bar{b}})^2 = \tilde{m}_{\tilde{t}}^2$$

MET condition

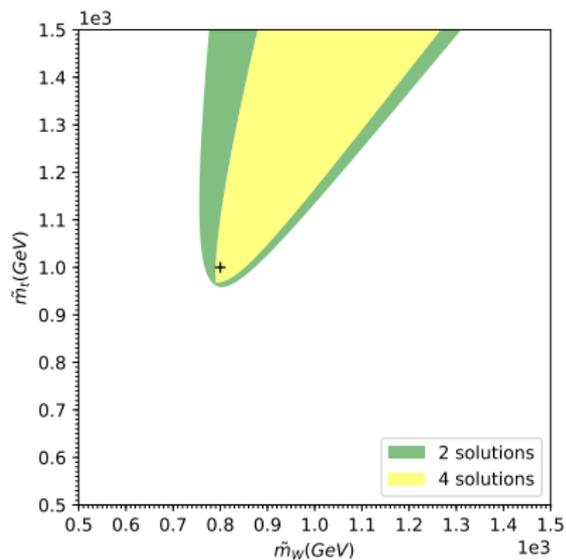

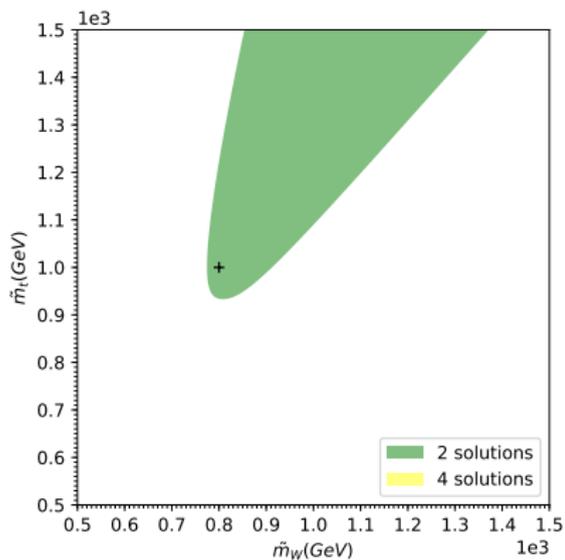

$$\vec{p}_{\nu,T} + \vec{p}_{\bar{\nu},T} = \vec{p}_T$$

8 unknown momentum components, ~~8~~ 8 constraints

Introduce test masses $\tilde{m}_{\tilde{t}}$, $\tilde{m}_{\tilde{W}}$, $\tilde{m}_{\bar{\nu}}$

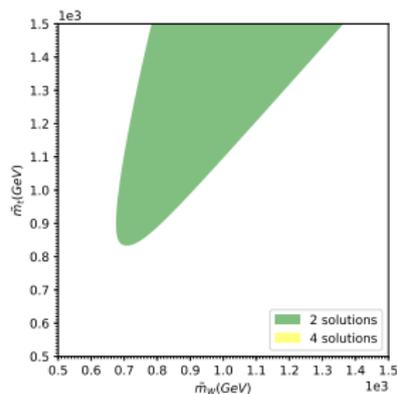

Solvability

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

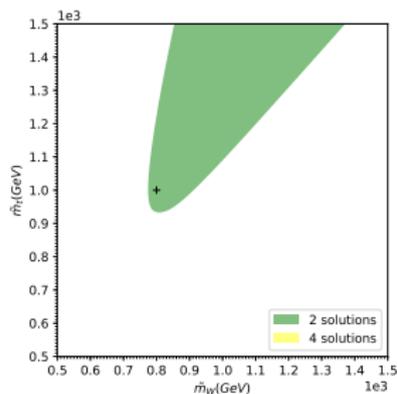

Solvability

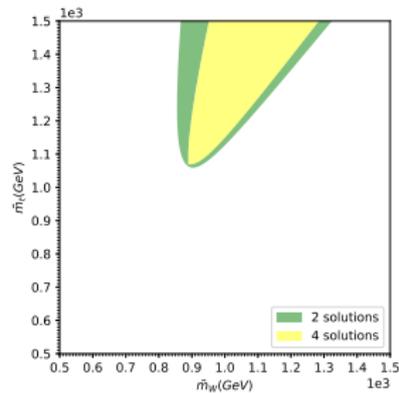

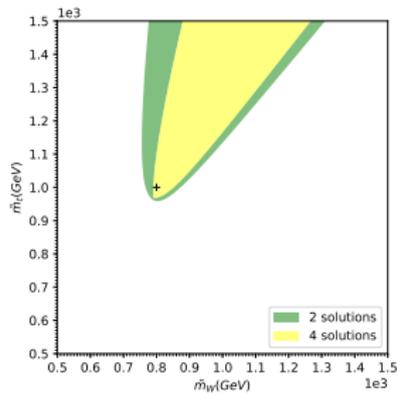

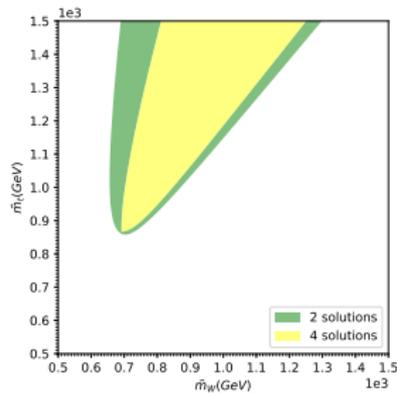

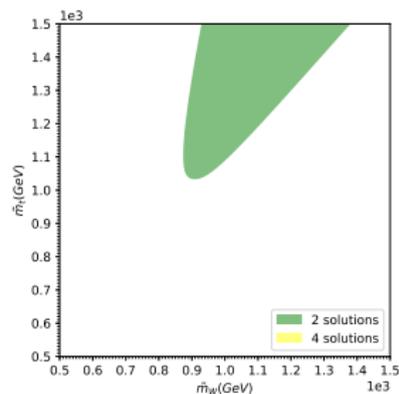

$$\tilde{m}_{\tilde{\nu}} = 600 \text{ GeV} < m_{\tilde{\nu}}$$

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

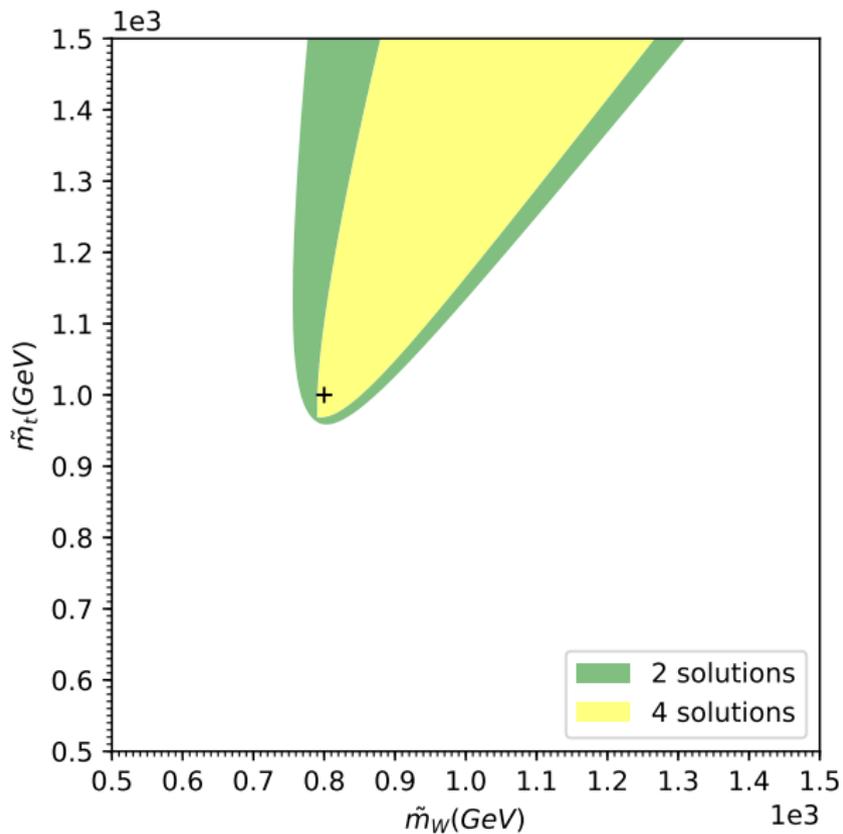

$$\tilde{m}_{\tilde{\nu}} = 800 \text{ GeV} > m_{\tilde{\nu}}$$

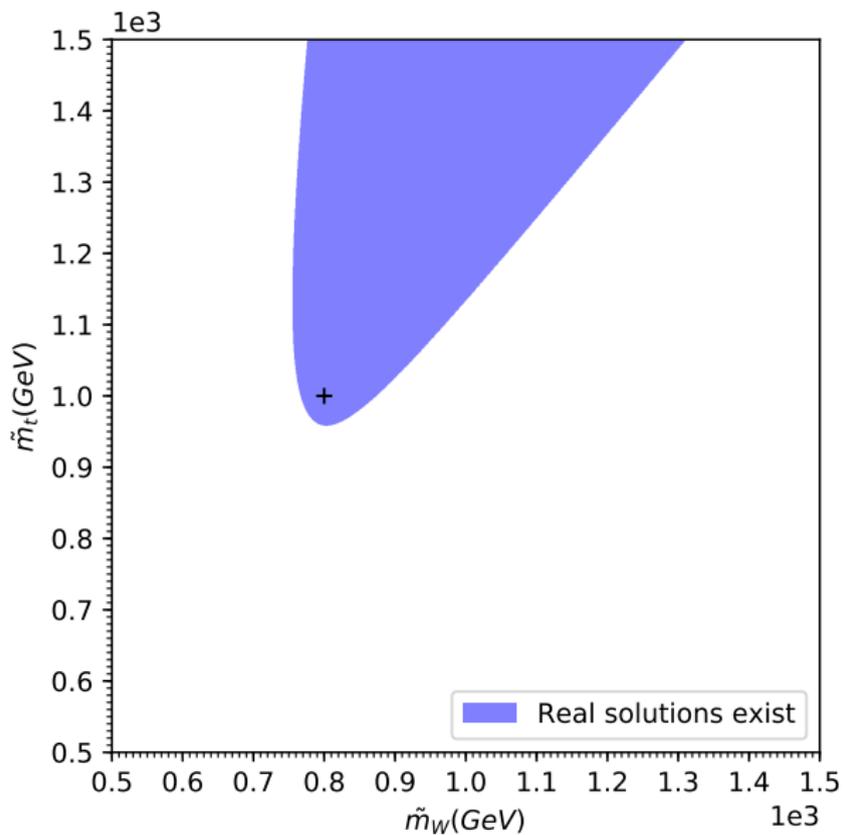

Solvability

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

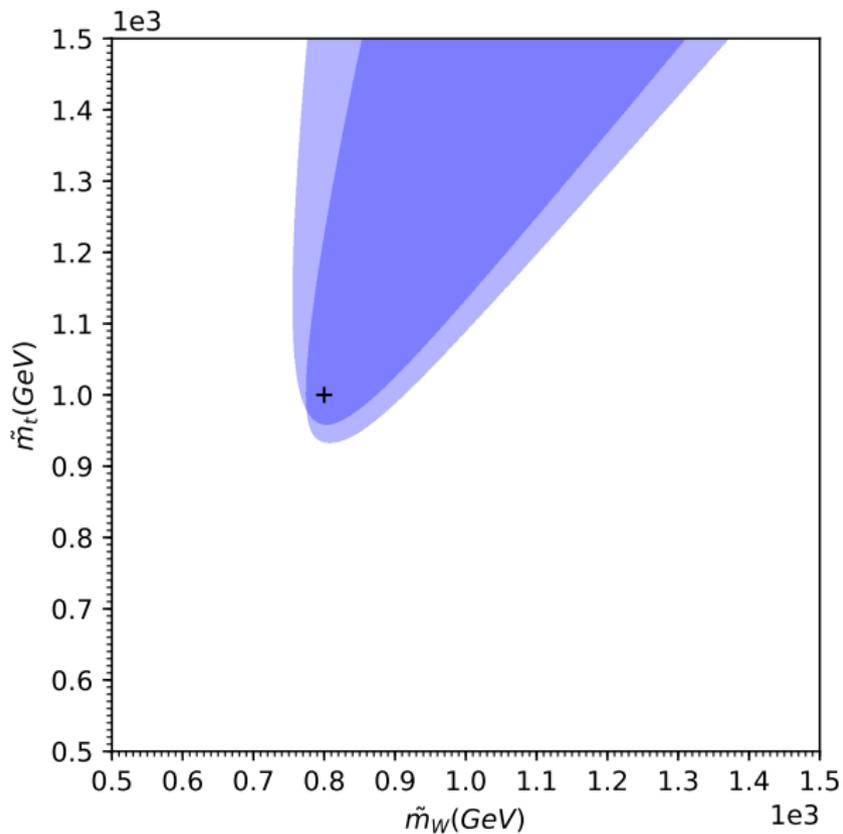

Solvability

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

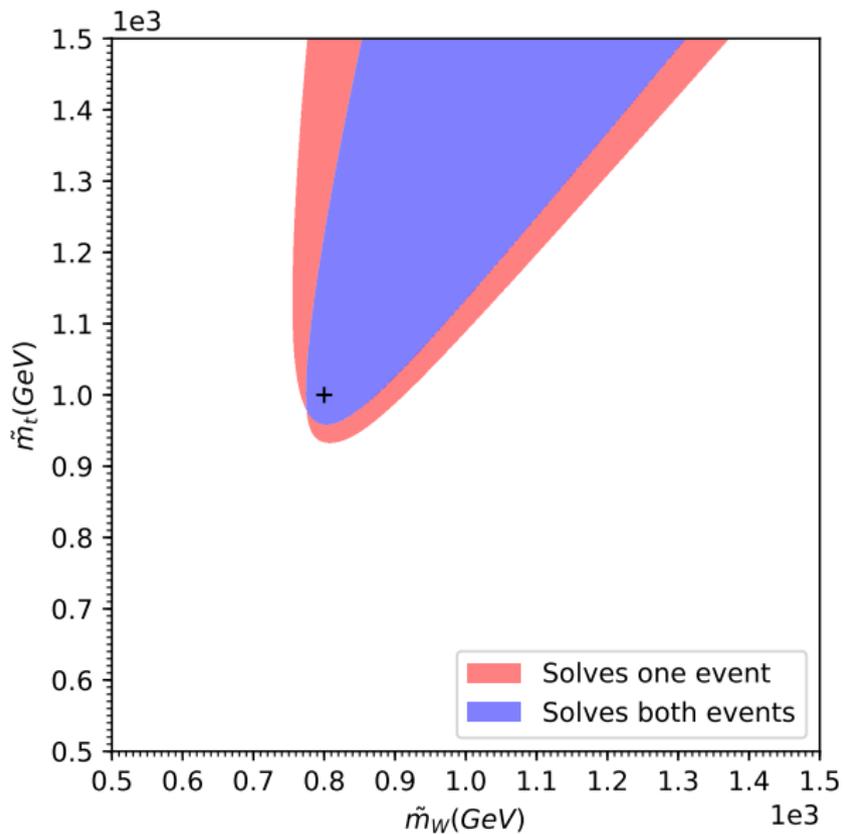

Solvability

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

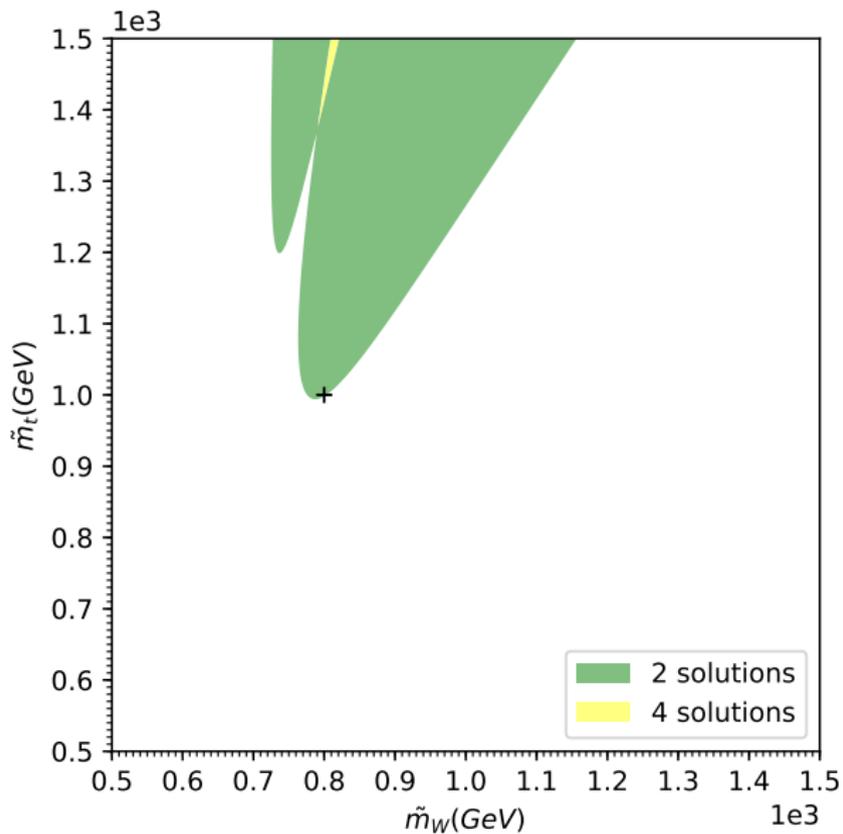

Solvability

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

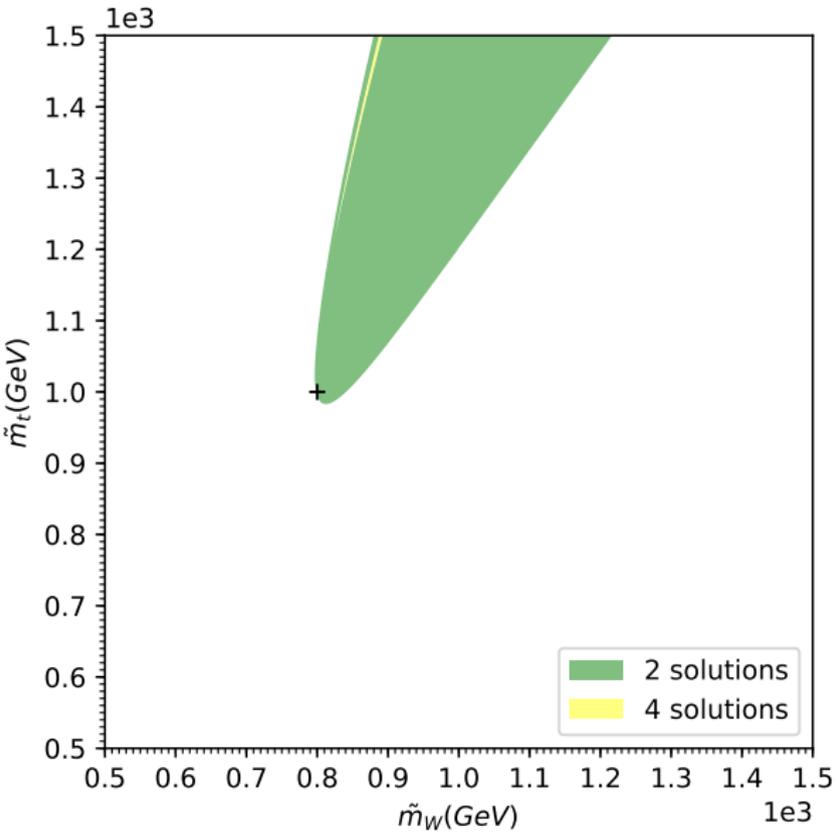

Extreme events

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

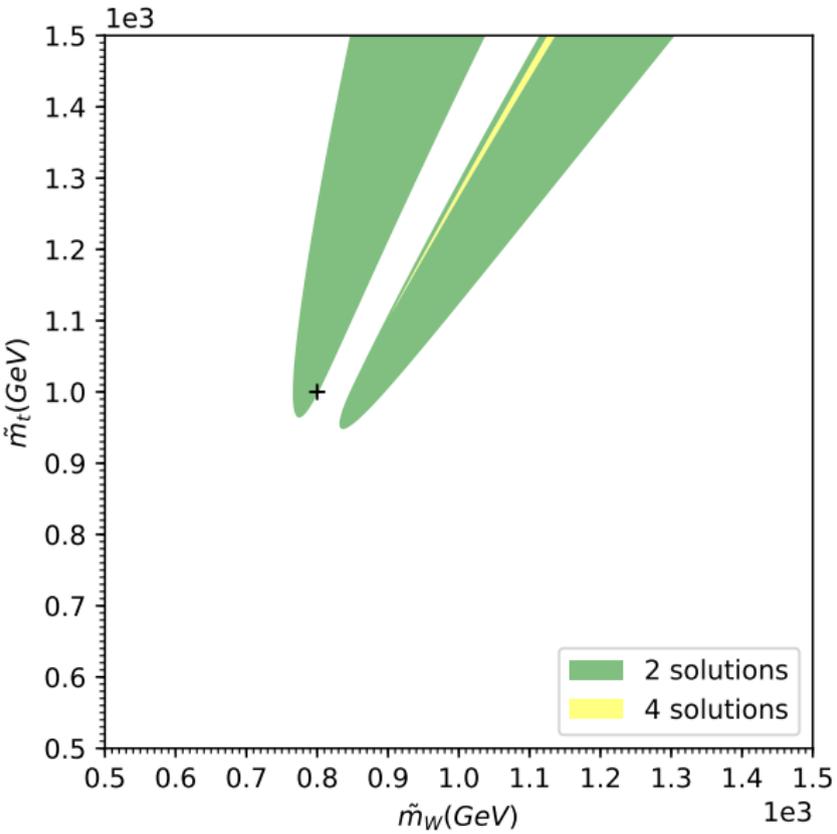

Extreme events

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

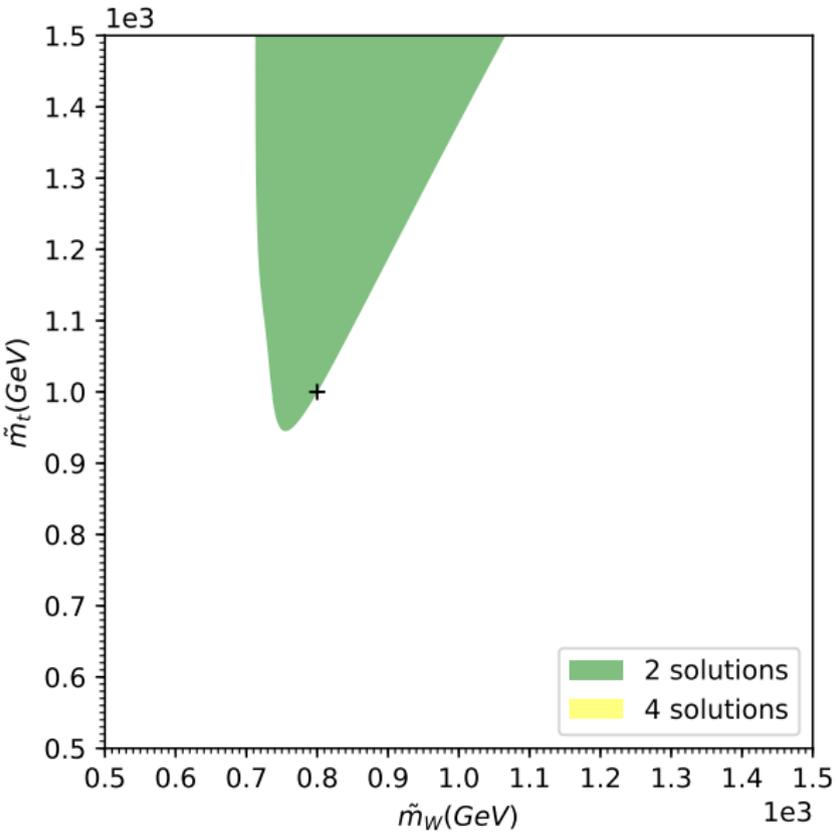

Extreme events

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

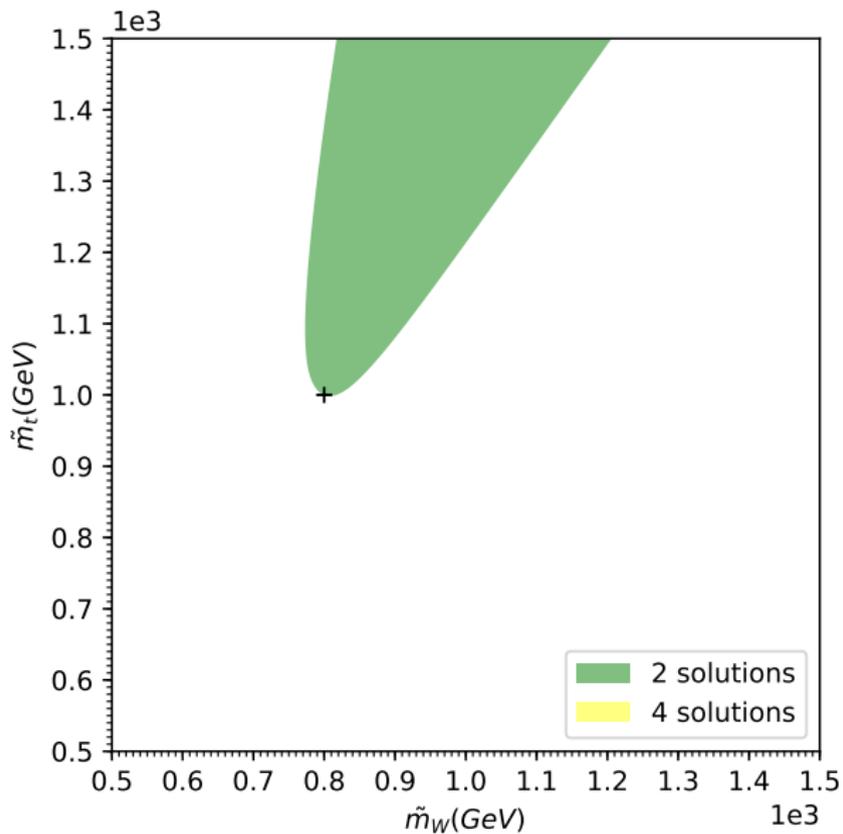

Extreme events

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

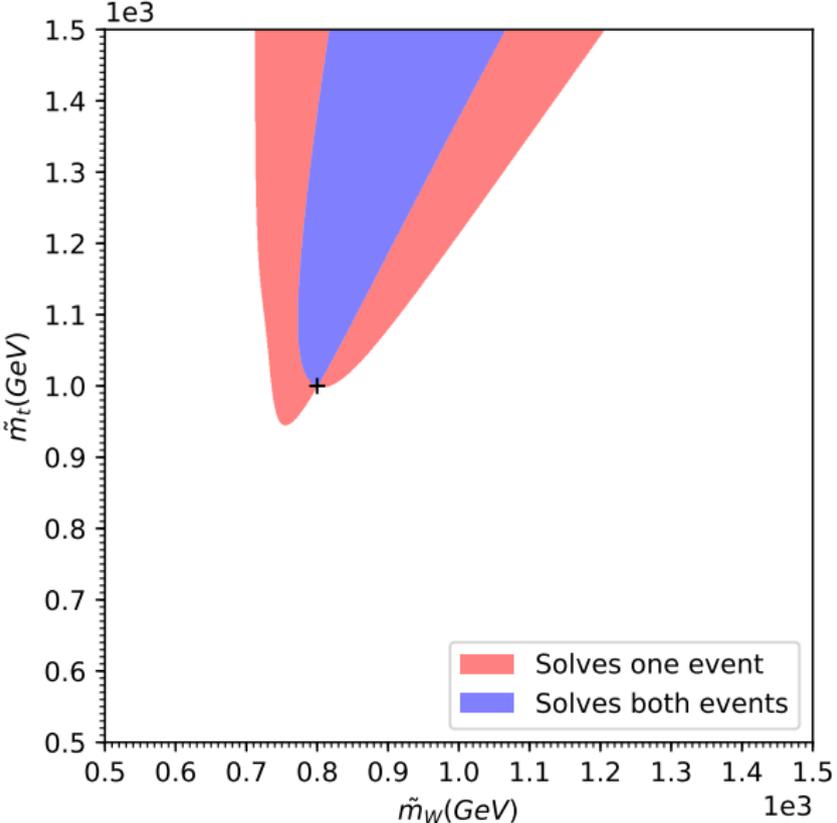

Extreme events

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

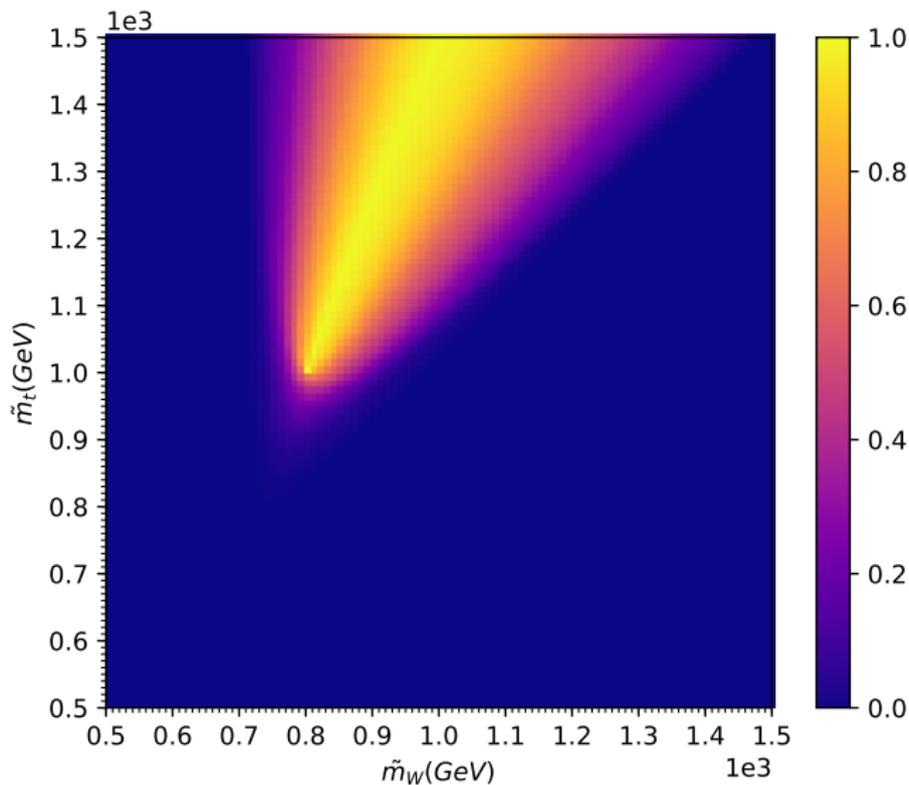

Extreme events

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

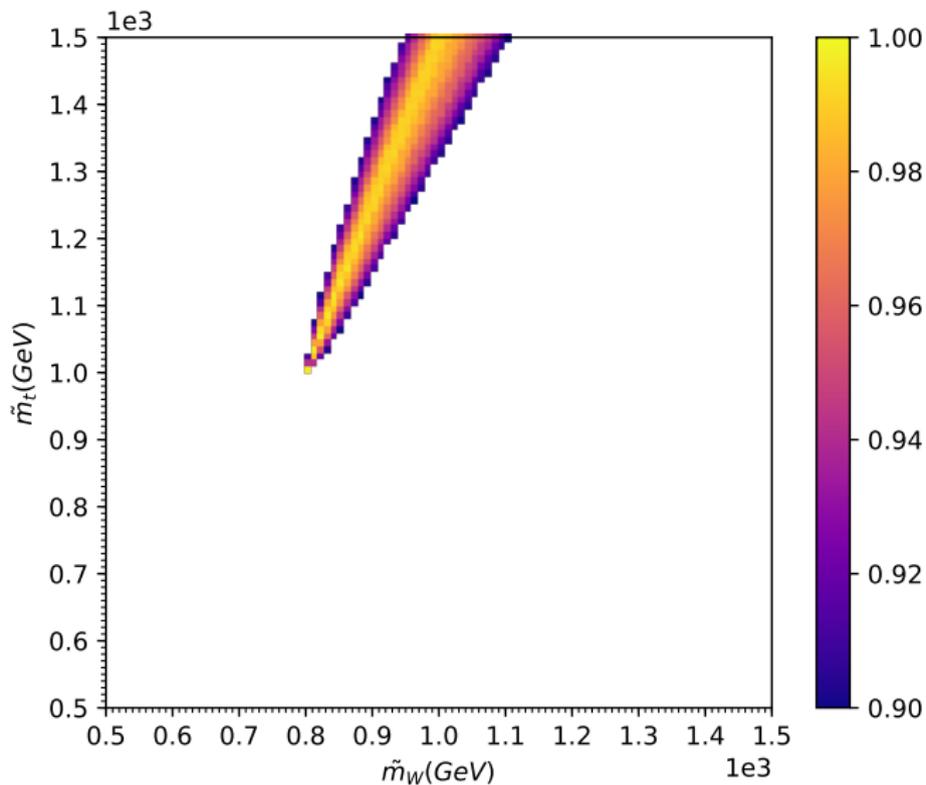

Fraction of solvable events

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

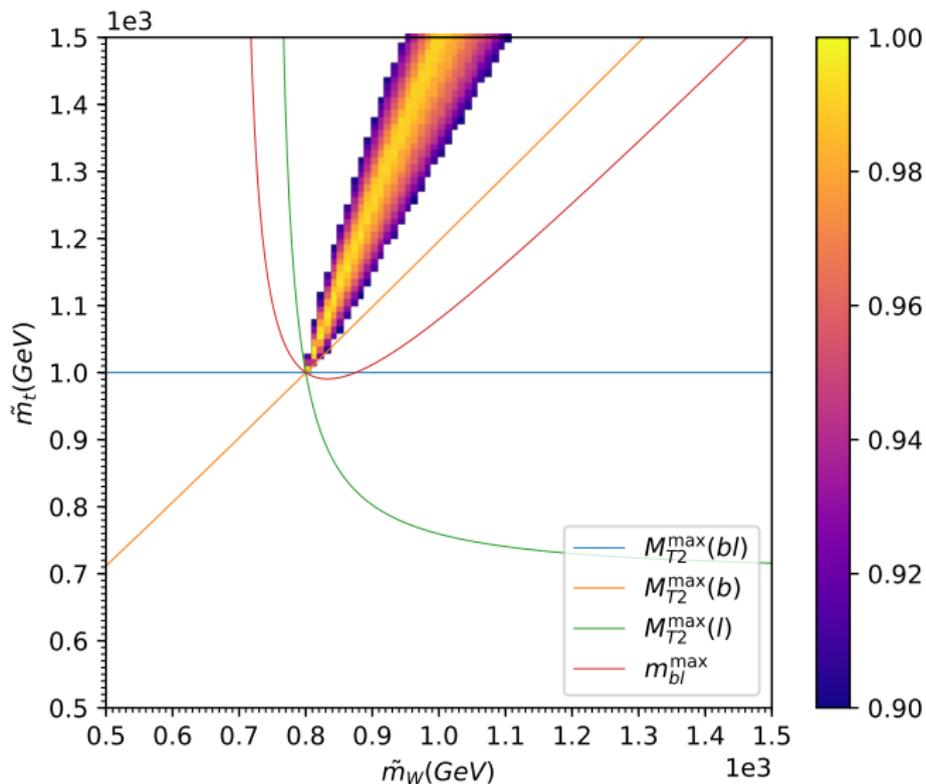

Fraction of solvable events

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

Adding end point measurements

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

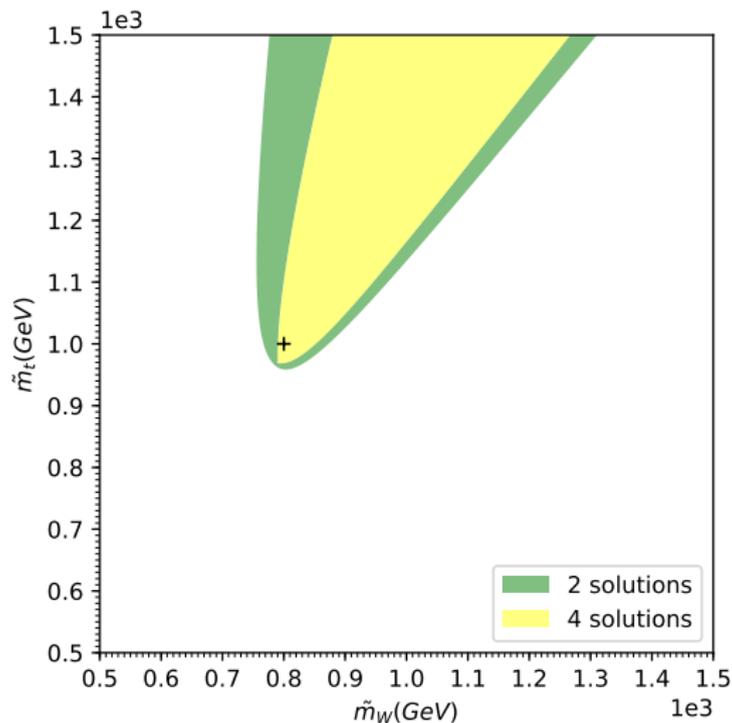

Our method... Focus Points

Boundaries where no. of solutions changes

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

1 event (Not necessarily extreme)

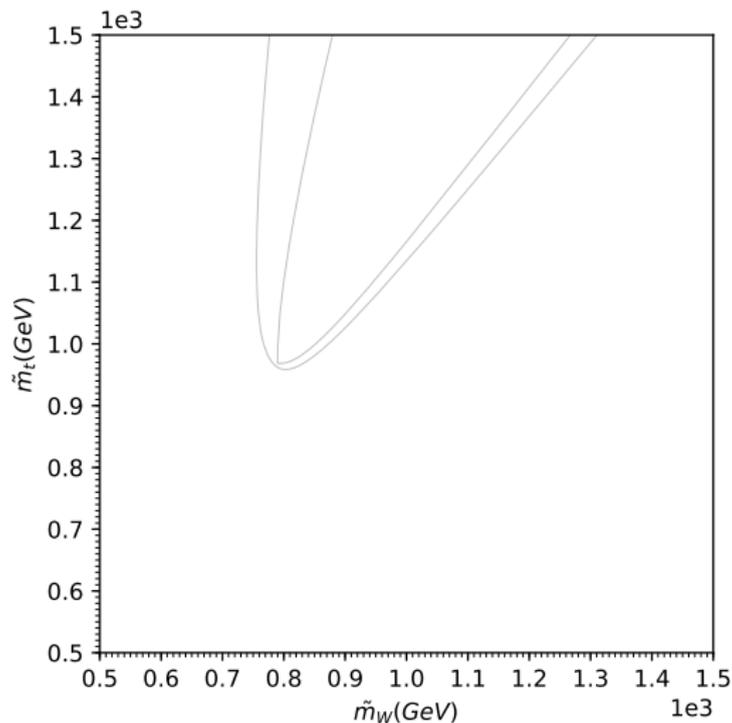

Our method... Focus Points

Boundaries where no. of solutions changes

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

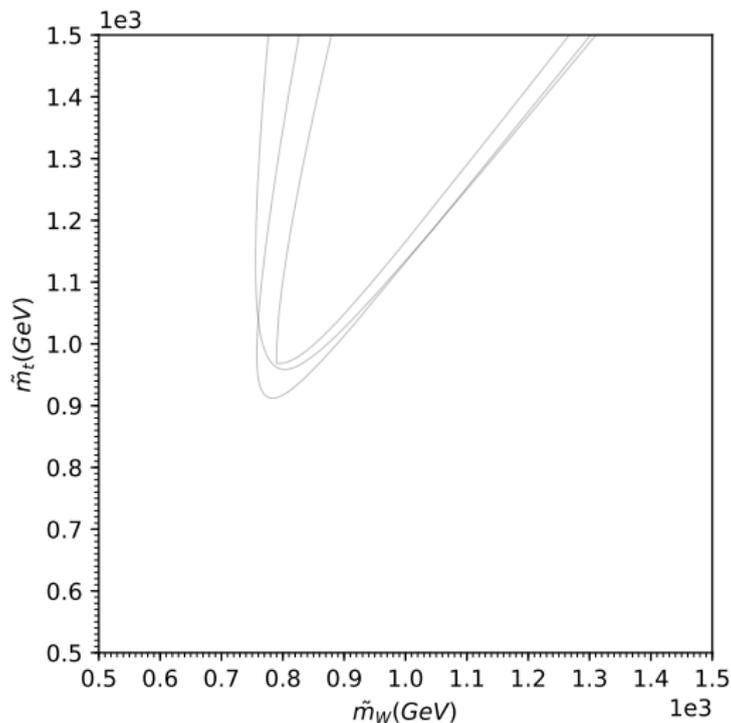

1 event (Not necessarily extreme)

Our method... Focus Points

Boundaries where no. of solutions changes

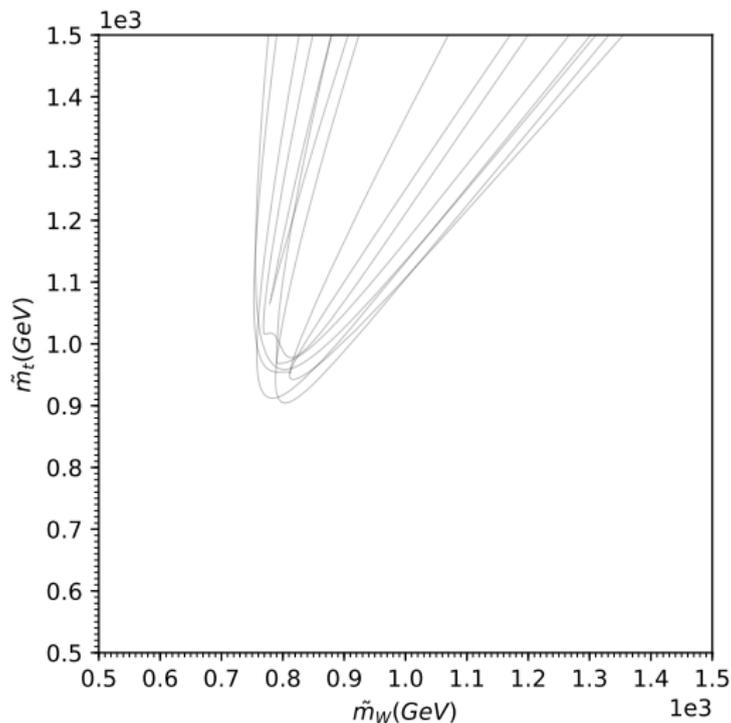

$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$
2 events (Not necessarily extreme)

Our method... Focus Points

Boundaries where no. of solutions changes

$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$
5 events (Not necessarily extreme)

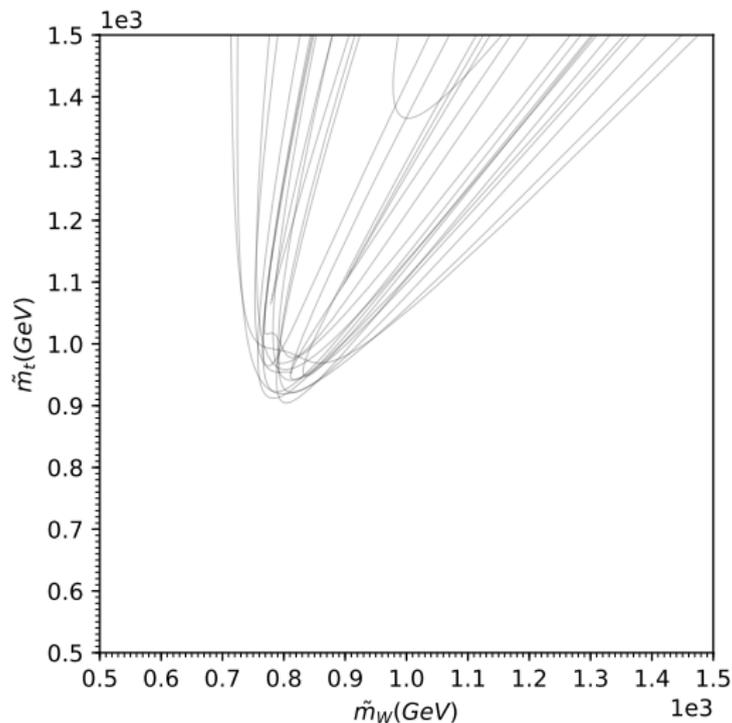

Our method... Focus Points

Boundaries where no. of solutions changes

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

10 events (Not necessarily extreme)

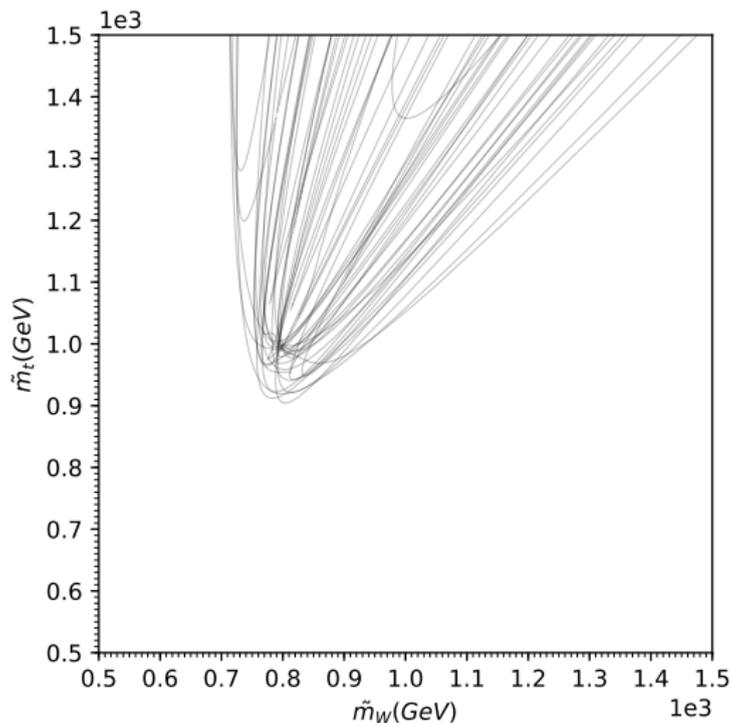

Our method... Focus Points

Boundaries where no. of solutions changes

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

20 events (Not necessarily extreme)

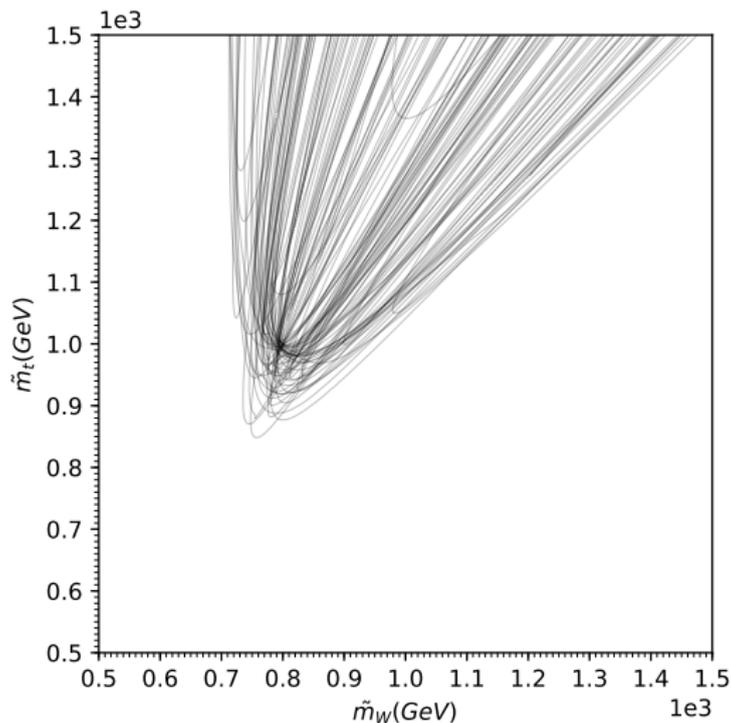

Our method... Focus Points

Boundaries where no. of solutions changes

$$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$$

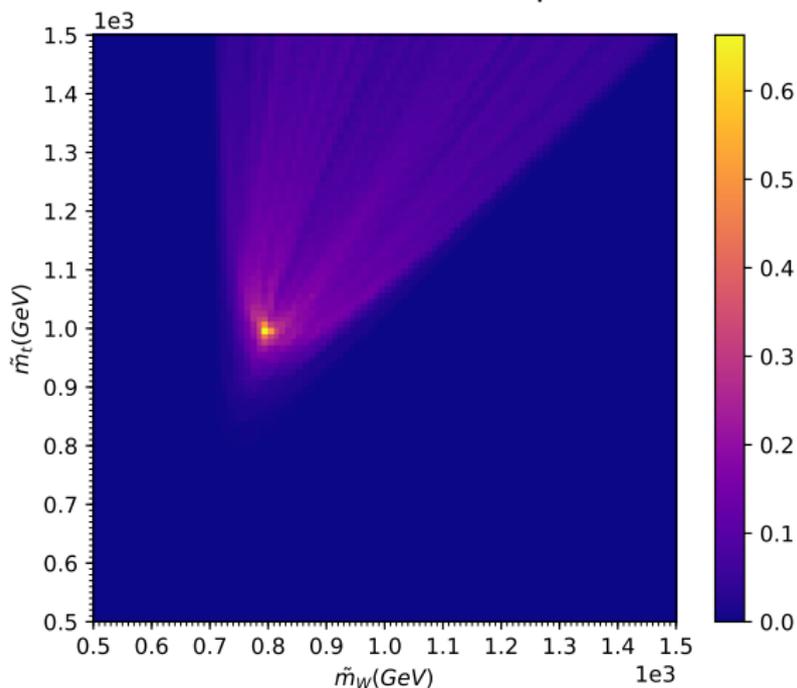

50 events (Extreme events are abundant!)

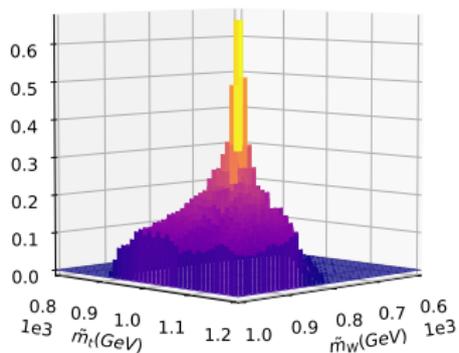

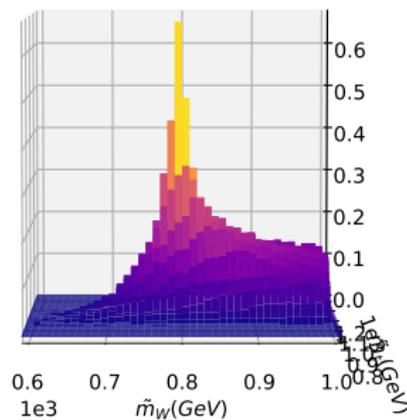

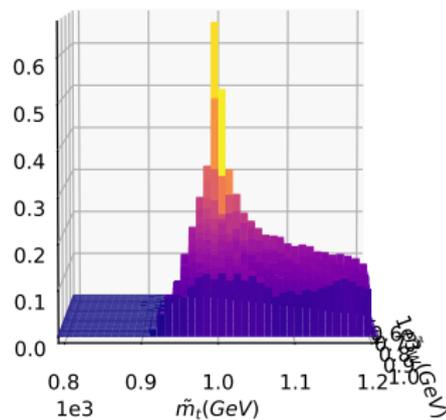

Our method... Focus Points

MONEY PLOT!

Fraction of events whose extremeness boundaries pass through
a 10 GeV x 10 GeV square

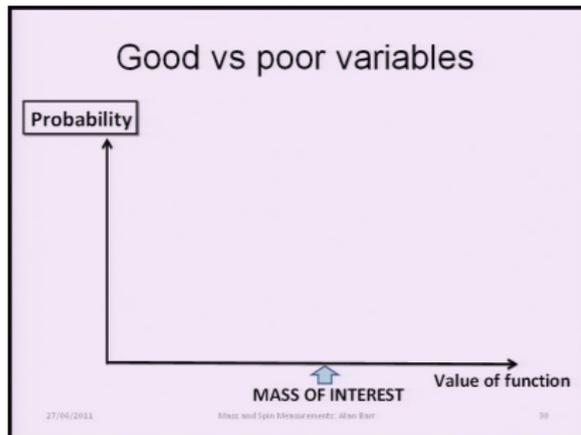

Our method... Focus Points

Summary: Great variable!

Outlook and future plans

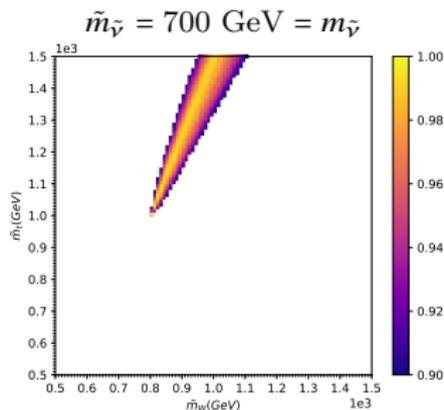

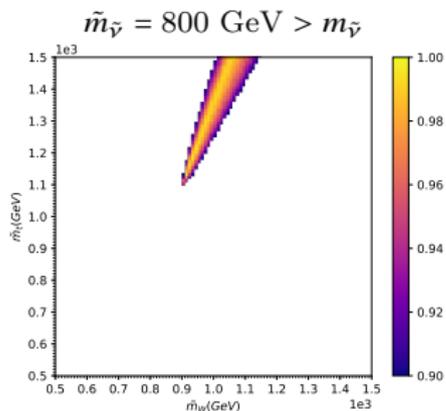

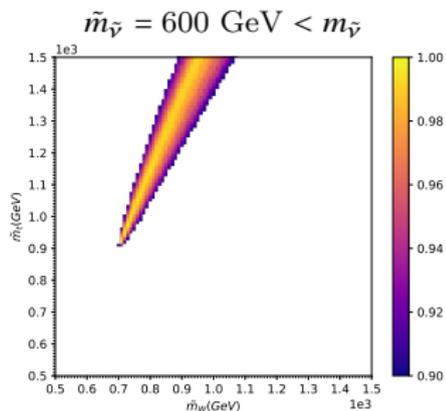

1. Each event provides a candidate curve (extremeness boundary) of masses. We see a sharp peak in the density of these curves at the true mass.
2. This is based only on event kinematics.
3. (1) and (2) suggest that in addition to measuring the masses of particles, this technique can be engineered to be a **BSM search technique**.
4. This technique is applicable to a few other decay topologies as well. But that's a subject for another talk.

Thank You!

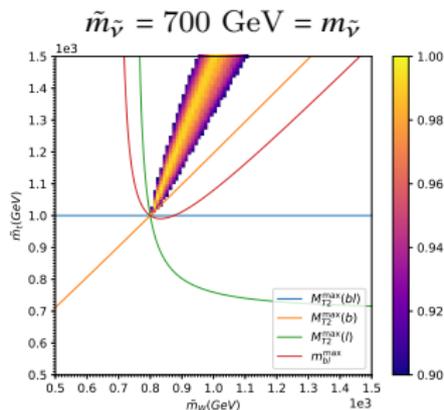

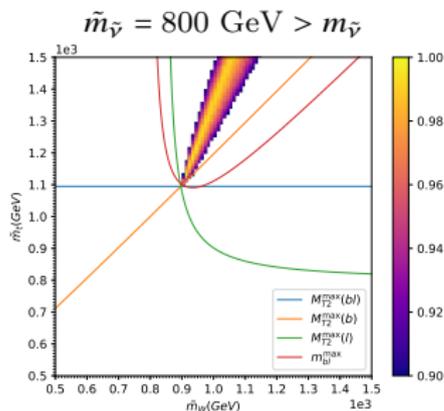

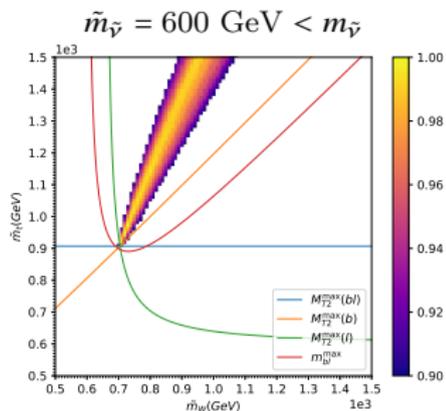

Bonus slides (finding $m_{\tilde{\nu}}$): Solvability + Endpoint measurements

Bonus slides (finding $m_{\tilde{\nu}}$): Solvability + Endpoint measurements

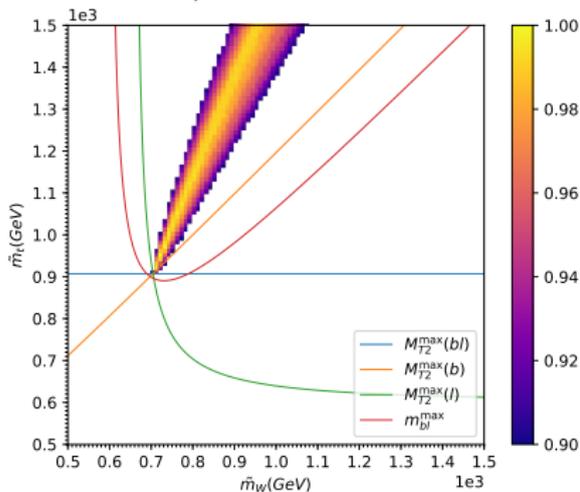

Bonus slides (finding $m_{\tilde{\gamma}}$): Solvability + Endpoint measurements

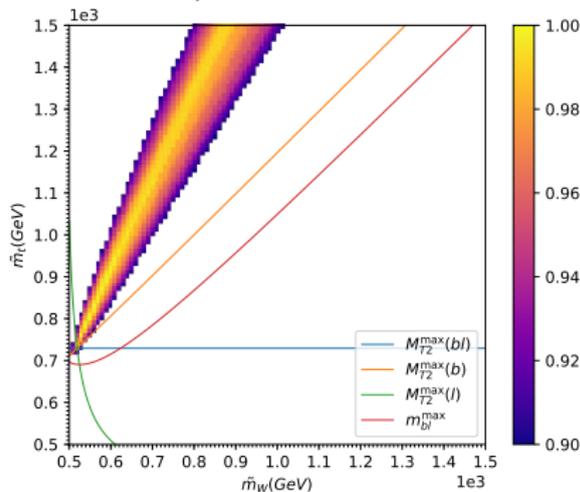

Bonus slides (finding $m_{\tilde{\nu}}$): Solvability + Endpoint measurements

$$\tilde{m}_{\tilde{\nu}} < m_{\tilde{\nu}}$$

$\tilde{m}_{\tilde{\nu}} = 600 \text{ GeV}$

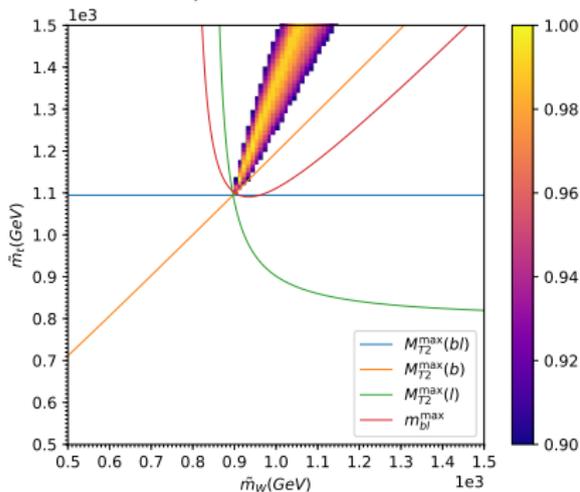

$\tilde{m}_{\tilde{\nu}} = 400 \text{ GeV}$

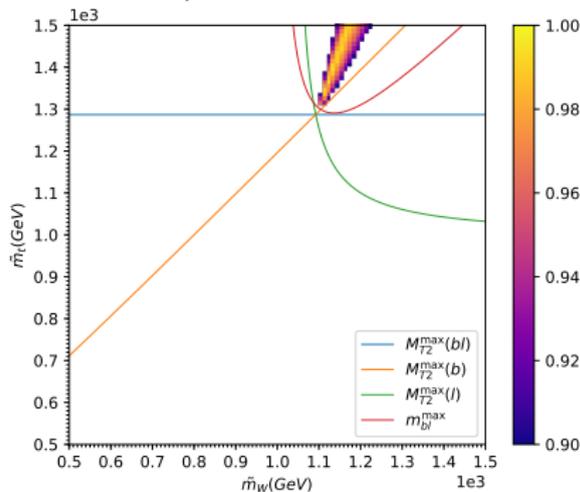

Bonus slides (finding $m_{\tilde{\nu}}$): Solvability + Endpoint measurements

$$\tilde{m}_{\tilde{\nu}} > m_{\tilde{\nu}}$$

$\tilde{m}_{\tilde{\nu}} = 800 \text{ GeV}$

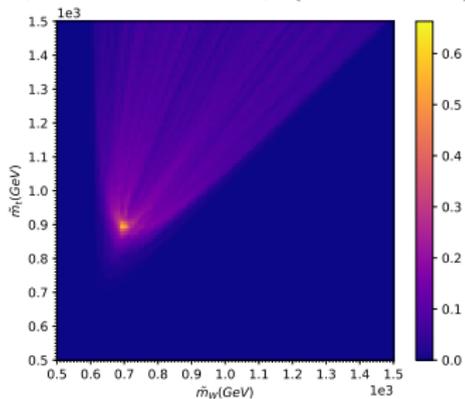

$\tilde{m}_{\tilde{\nu}} = 1000 \text{ GeV}$

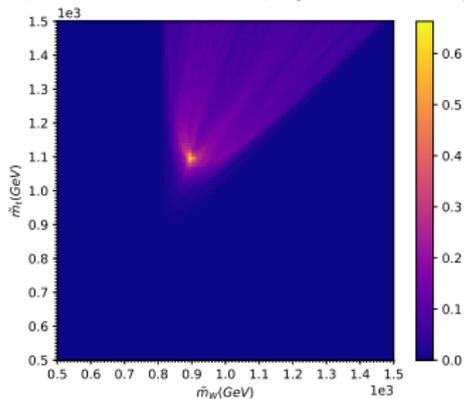

Bonus slides (finding $m_{\tilde{\nu}}$): Focus Points

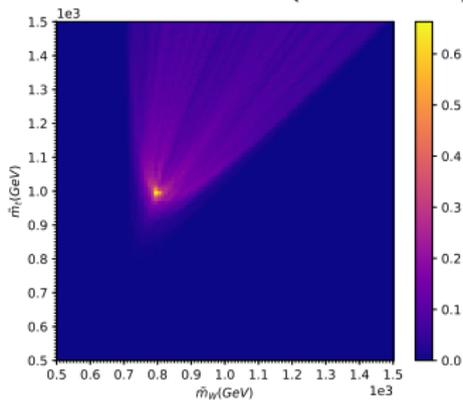

$\tilde{m}_{\tilde{\nu}} = 600 \text{ GeV} < m_{\tilde{\nu}}$ (max = 0.56)

$\tilde{m}_{\tilde{\nu}} = 800 \text{ GeV} > m_{\tilde{\nu}}$ (max = 0.61)

$\tilde{m}_{\tilde{\nu}} = 700 \text{ GeV} = m_{\tilde{\nu}}$ (max = 0.66)
