Particle Mass Measurements from Extreme Event Reconstruction and Focus Points

Tuesday, 9 May 2017 17:00 (15 minutes)

We investigate the solvability of the event kinematics in missing energy events at hadron colliders, as a function of the particle mass ansatz. To be specific, we reconstruct the neutrino momenta in dilepton $t\bar{t}$ -events, without assuming prior knowledge of the top, W and neutrino masses. We identify a class of events, which we call *extreme events*, with the property that the boundary of their allowed region in mass parameter space passes through the true mass point. We show that the collection of such *extremeness boundaries* is focused on the true values of the mass parameters and can be effectively used for mass determination. We derive a kinematic variable which allows us to recognize a given event as extreme.
