

What I have done

- Software preparation:
 - Installed a virtual machine on my Mac
 - installed Labview and Github in the virtual machine
 - Had everything downloaded
- Learning LabVIEW:
 - Started to learn basic LV programs including data flow, data types, creating sub VIs, using chart and graphs, using debugging tools, using tools palette, using arrays, using case structures, using loops

Things I will work on

- Keep learning to program on LabVIEW
- Try to gain a sense of the progress of the whole project (what has been done and what needs to be done) and try to contribute to it as soon as possible
