HTCondor and kerberos renewal

Wednesday 7 June 2017 14:25 (25 minutes)

In the last year, HTCondor has been enhanced with mechanisms to allow for kerberos tokens to be renewed. This is achieved in HTCondor with hooks for security credential producers, and security credential monitors. I propose to talk about using these methods, what we integrate with to handle the monitoring and renewal of kerberos tokens at CERN, operational experience in doing so, what we actually need/use it for, and how we might look at further developing this feature in the future.
