[503] Simple atomic quantum memory suitable for semiconductor quantum dot single photons

Thursday 24 August 2017 11:15 (15 minutes)

Quantum memories matched to single photon sources will form an important cornerstone of future quantumnetwork technology. We demonstrate such a memory in warm Rb vapor with on-demand storage and retrieval, based on electromagnetically induced transparency. We test the memory with laser pulses, attenuated to the single photon level. Their bandwidth is chosen to be 660(10) MHz to simulate the photons emitted by semiconductor quantum dots. In this regime, vapor cell memories offer an excellent compromise between storage efficiency, storage time, noise level, and experimental complexity. For 50 ns storage time, we measure an end-to-end efficiency of 3.4(3) %, extrapolating an intrinsic storage and retrieval efficiency of 17(3) %.

Authors: Mr BUSER, Gianni (University of Basel); Dr WOLTERS, Janik (University of Basel); Mr MOTTOLA, Roberto (University of Basel); Dr HORSLEY, Andrew (University of Basel); Dr BÉGUIN, Lucas (University of Basel); Dr JÖCKEL, Andreas (University of Basel); Mr JAHN, Jan-Philipp (University of Basel); Prof. WARBUR-TON, Richard J.; Prof. TREUTLEIN, Philipp (University of Basel)

Presenter: Mr BUSER, Gianni (University of Basel)

Session Classification: Atomic Physics and Quantum Optics

Track Classification: Atomic Physics and Quantum Optics
