【521】 Laser-pumped high performance vapor-cell atomic clocks

Friday 25 August 2017 11:15 (30 minutes)

We present our spectroscopic and metrological investigations related to the development of next generation high performance vapor-cell atomic clocks. Such precision instruments are crucial for applications such global satellite navigation systems and network synchronisation. Our studies concern both basic atoms-photons resonant interactions (in the microwave and optical domains) and more technological aspects such as compact wavelength stabilised lasers.
