[315] Semileptonic decays at LHCb

Wednesday 23 August 2017 18:00 (15 minutes)

Studies of semileptonic decays at LHCb cover a wide-range of possible measurements: cross-sections, lifetimes, mixing and CP violation, CKM matrix elements, tests of lepton universality... Thanks to their large statistics, semileptonic decays allow for ultimate precision measurements, assuming systematic uncertainties can be kept under control.

I will present here a brief selection of the latest results on the topic.
