【56】 DECTRIS - 10 years counting what matters

Wednesday 23 August 2017 17:00 (20 minutes)

DECTRIS, founded 2006 as a spin-off from the PSI, is a Swiss company specializing in high-end X-ray detectors. The company's mission is to bring single photon counting technology originally developed for the LHC to users in science, medicine and industry.

This talk is both a look back and a look ahead: what did it take to become the widely recognized leader for X-ray detectors for synchrotrons and laboratories, and what will it take to capture the markets in X-ray imaging and electron microscopy in the coming decade?
