

A trip through some ATLAS achievements  
&  
Student opportunities

# PHYSICS OF THE EARLY UNIVERSE

04.04.2017

- All forces in nature obey a form of symmetry.
  - Gauge-symmetry
- The Standard Model (SM) describes interactions between elementary particles grouped in 3 families of quarks and leptons
- The Standard Model
  - unifies Electromagnetism (long range, macroscopic, photon has no mass) and Weak force (short range, microscopic, W and Z are heavy) ...at high energies
  - describes (almost) all current particle physics data

- The Electroweak symmetry must be broken at low energies in order to give the weak bosons (W,Z), as well as all matter particles, masses.
- A scalar field requiring a new particle, the Higgs Boson ...

# The Standard Theory of Particles and Forces

- Forces are dictated by (gauge) symmetries
  - Fermions in  $3! = SU(3)_C * [SU(2)_L * U(1)_Y] \rightarrow$  QCD + Electroweak ("=" QED + Weak)

- Symmetries of laws do not necessarily lead to symmetries of outcomes
  - Electroweak symmetry spontaneously broken – Brout Englert Higgs mechanism
  - BEH “hides” EW symmetry, gives masses to weak gauge bosons and “approves” fermion masses, predicts couplings of particles to Higgs, and more
- Higgs boson mass is not predicted by the SM
- Must be measured!**

# Origin of mass

<http://www.atlas.ch/multimedia/4-muon-event.html#origin-of-mass>

# LHC Physics

- Particle collisions at LHC
  - proton + proton
    - Study Standard Model, including Higgs, in new energy domain
    - Search for new physics capable of explaining various mysteries
    - Be ready for surprises
  - LHC collides also heavy ions: pb-pb and p-pb
    - High energies and high densities
    - New state of matter, quark-gluon plasma, ...

$$N_{\text{Physics}} = \sigma_{\text{Physics}} \left( \int \mathcal{L} dt \right)_{\text{Beams}}$$

- Sensitivity to rare phenomena
  - with small cross sections
  - depends on the luminosity

CERN  
LHC

# Grand Unification Theories (GUT) and SuperSymmetry (SUSY)

- Current data also hint at a unification between Strong and Electroweak forces ... at much larger energies, GUT scale.
- GUT is a symmetry between Leptons and Quarks
  - unifies strong and electroweak forces
- SUSY unifies “matter and force particles”: “matter-force duality”
  - relates particles of different spins: Fermions-Bosons (Susy does not really link
  - introduces super-partners to each SM particle the SM fermions and gauge bosons as illustrated in the figure; it predicts a superpartner for all SM particles)
  - requires 5 Higgs particles
  - provides DM candidate

# SUSY helps Grand Unification

# Search for Di-lepton resonances ( $ee$ , $\mu\mu$ )

– New gauge bosons  $Z'$

– Graviton  $G^*$

- Sequential SM
  - $M_{Z'} > 2.86 \text{ TeV}$
- (Superstring)  $E_6$ -inspired models
  - $M_{Z'} > 2.38 - 2.54 \text{ TeV}$

- Randall-Sundrum Graviton (extra space dimensions)
  - $M_{G^*} > 2.47 \text{ TeV}$

# Research-based education

- Sharing ATLAS data and discoveries with students
  - Masterclasses: high schools
  - Research-based student projects
- ZPATH [Z-Path](#)
  - most popular LHC educational material
  - Identify di-lepton, 4-lepton or di-photon final states.
  - Look for and study known (J/Psi, Upsilon, Z, Higgs)
  - Search for unknown particles (Z', Graviton) using the invariant mass concept

Physics with ATLAS

USA Easter June 2014  
Education

High school students from all geographical regions master real event display programmes, software tools and analysis methods. Having been introduced to the problem, they identify electrons, muons, photons and jets by exploiting their characteristic signals in various detector elements, perform event selection and categorization, and perform the final analysis goals. (Image credits: left to right: Caroline Hamilton/CoEPP/University of Melbourne, Jayne ImON/creative, Franiska Viehahn/TU Dresden.)

## International Masterclasses in the LHC era

Each year in spring, the International Particle Physics Outreach Group organizes the International Masterclasses, which give students the opportunity to analyse data from the LHC.

ATLAS "discovery" data are available for students to search for a Higgs boson. CMS approved 13 Higgs candidates in the mass region of interest, which are analysed in a more abundant sample of  $ZZ$  and  $Z$  events, for "treasure hunt" activities. ATLAS data allow students to study the relative production of various particles, which would be a tell-tale signal of quark-gluon plasma production. LHC's teachers students how to measure the lifetime of the  $D$  meson, and particles containing  $b$  and  $c$  quarks are studied extensively to shed light on the mystery of antimatter in the universe.

The International Masterclasses (IMC) began in 2003 as an initiative. Students quickly master real event display programmes – with

# Follow the "heart beats" of LHC and bring the most recent discoveries and measurements to the students

- The Z-path and some of the accompanying tools
  - developed at Oslo and under constant development
- After Higgs discovery, Higgs boson part of Z-path
- In 2016, Graviton added ...
  - In time with infamous 750 GeV di-photon excess observed in 2015
  - later proved to be only a statistical fluctuation
- Supersymmetry and DM ... ready

# Students research-based project

- Olav Thon Foundation 2017
  - 1.5 MNOK research grant - 3y, Eirik, Magnar et al.
- Develop new courses based on measurements and discoveries at LHC and other research infrastructures.
- Further develop Z-path towards a standalone resource based on CERN data made public by experiments
  - use as support material by teachers and researchers
- Convey advanced physics concepts and phenomena and introduce new ideas beyond today's theoretical framework describing the content of the Universe and its evolution
- Interested?

# Possibilities for Master Projects – High Energy Particle Physics

- Particle physics – measurement, analysis, interpretation – experiment & phenomenology
- Detector research & development
- Computing & software
- Research education
  
- *Possibilities for short and long stays at CERN, participation in measurements and data taking*

# Searches for Dark Matter & new physics phenomena / symmetries

With the advent of higher energies and higher collision rates, the LHC continues the exciting voyage towards new physics phenomena, allowing physicists all over the world to explore a previously unknown territory full of promise.

The ambitious LHC physics programme may shed light on some of the greatest mysteries in physics today: (i) the nature of dark matter, and (ii) the behaviour of the gravitational force at the microscopic scale.

Symmetries play a crucial role in physics. Supersymmetry relates integer spin particles (bosons) and half-integer spin particles (fermions). It allows unification of the electroweak and strong interactions, proposes dark matter candidates, and predicts new Higgs bosons. Processes of interest involve superpartners of the leptons, of the gauge and Higgs boson, as well as a dark matter particle, which is predicted to be the lightest supersymmetric particle. The studies will include a search optimization, analysis of ATLAS data at 13 TeV and interpretation of results, making use of constraints from astrophysics and cosmology.

# Søk etter mørk materie i ATLAS eksperimentet på CERN.

Masterstudenten lage en analyse for å finne mørk materie signaler i ATLAS, enten ved å lete etter supersymmetri eller en mer generisk analyse. ATLAS får nye data i 2017-18. Studenten utvikler kunnskap bl. a. om partikkelfysikk, partikkeldetektorer, dataanalyse verktøy, programmering (C++, Root), statistikk. Studenten får anledning til kortere eller lengre utenlandsopphold ved CERN, f.eks. gjennom trening og/eller CERNs sommer skole.

- *Prof. Heidi Sandaker, FØ384, Heidi.Sandaker@fys.uio.no*

# New fundamental Nature's fundamental forces

Do **new fundamental forces** show up at the LHC the way the Z and Higgs bosons did?

According to superstring theories, which propose to unify all fundamental forces, including gravity, there is room for new forces to be mediated by new gauge bosons, generically known as  $Z'$  and  $W'$ . A series of simplified models predict Dark Matter to couple to a variety of  $Z'$  bosons, including sometimes some new scalars.

This work consists in a detailed study and implementation into Monte Carlo generators of various theories beyond the Standard Model. This will be followed by an analysis of ATLAS data, taken at the highest available energies, a comparison to simulation data, and interpretation of the results.

# Gravity at the microscopic scale

Gravity as we know it is negligible at the subatomic level. The addition of  $n$  space dimensions affect the behaviour of the gravitational force, changing from  $1/r^2$  to  $1/r^{(2+n)}$ , thus enhancing its strength at very short distances  $r$ .

A way to search for signatures of gravity at the LHC, and thus reveal the existence of microscopic space dimensions, is to look for graviton excitations and/or microscopic black holes. Both would decay into SM particles, measurable in particle detectors. Advanced analysis and statistical methods are crucial to distinguish these new phenomena from competing standard as well as BSM processes.

▫ *Prof. Farid Ould-Saada, FØ377, Farid.Ould-Saada@fys.uio.no*

# Model-independent searches for new physics

The various scenarios of new physics theories discussed above may show up in a given process at the LHC.

Model independent searches for new physics are proposed in final states with leptons recorded with the ATLAS detector. New methods and tools involving neural networks and machine learning algorithms are to be used and optimized, using real data as well as Monte Carlo data based on various theoretical implementations, in order to correctly interpret any signal of new physics.

- *Prof. Farid Ould-Saada, FØ377, Farid.Ould-Saada@fys.uio.no*

# Precision measurements of Higgs boson production in the decay channel to two photons in the ATLAS experiment at the LHC

Although the first measurements of the properties of the Higgs boson discovered at CERN in 2012 are consistent with the Standard Model, the uncertainties are large and there are many physically motivated models that would give small deviations from the Standard Model predictions. MSc projects in this activity include (a) the study of robust statistical models for the data-driven estimation of the background under the Higgs boson signal peak in the two-photon mass spectrum, (b) development of a new method to optimize the use of compute-intensive detailed simulations of the detector, (c) search for additional mass peaks below and far above the established mass peak at 125 GeV, (d) precision measurement of the Higgs boson mass, and (e) measurement of the transverse momentum spectrum of the Higgs boson. You will work with data taken during the 2015-18 runs of the LHC at 13 TeV, nearly twice the center of mass energy during 2011-12 (7 and 8 TeV). You will join the Hgamma working group in ATLAS, participate in the ongoing development of the data analysis strategies and code, learn, further develop and apply advanced statistical techniques, and, thus, contribute to furthering our understanding of the Brout-Englert-Higgs (mass-generating) mechanism and test whether there is new physics beyond the Standard Model (such as dark matter).

- ▣ *Prof. Alex Read, FØ381, a.l.read@fys.uio.no*

# Development of pixel detectors for the upgrade of ATLAS

Når LHC blir oppgradert til høyere intensitet må mange av detektorene i ATLAS byttes. I Norge deltar vi i utviklingen av pixel detektorer og vi får nye sensorer sommeren 2017 som skal bygges til moduler og testes.

Studenten kan velge mellom følgende oppgaver:

- Sett opp og test et lasermålesystem for å karakterisere nye pixel sensorer;
- Delta i ATLAS-testbeam på CERN og bidra til analyse av testbeam-data;
- Videreutvikle en metode (basert på Compressed Sensing) for 3-D målinger av pixel sensorer;
- Karakterisering av nye tynne 3-D pixel sensorer produsert av SINTEF og bygging av detektor-moduler.

Studentene utvikler kunnskap om detektorutvikling, sensorutvikling i samarbeid med SINTEF, silisumdetektorer, dataanalyseverktøy, elektronikk. Studentene får anledning til kortere eller lengre utenlandsopphold ved CERN, f.eks. gjennom CERNs sommer skole, trening og testbeam aktiviteter.

- *Prof. Heidi Sandaker, FØ384, Heidi.Sandaker@fys.uio.no*
- *Prof. Alex Read, FØ381, a.l.read@fys.uio.no*

# Path for education, research & discovery

The ambition to bring to the “classrooms” important LHC discoveries is realized using the discovery of the Higgs boson in 2012. Approximately 10% of the ATLAS discovery data were made available for students to search themselves for the Higgs boson. Promises of new discoveries in the 13 TeV LHC era and opportunities offered by the CERN open data have triggered new educational materials. We have room for 2 students to work on development of educational material based on new high energy particle physics research data and possible coming discoveries. We target high school as well as university students, including bachelor, master and PhD levels.

These educational materials follow the LHC 'heartbeats' and have the ambition to influence textbooks and teaching methods. This work is supported by the Thon Foundation (<https://www.facebook.com/fysikk/posts/1276286769120085>). We work in close contact with the International Particle Physics Outreach and the ATLAS collaborations.

- *Prof. Farid Ould-Saada, FØ377, Farid.Ould-Saada@fys.uio.no*

# Computing & Software at the Exascale

Computing and software at the Exascale are crucial parts of the LHC physics experiments. The NorduGrid Advanced Resource Connector (ARC) middleware increases in popularity due its simplistic design and ease of deployment. This makes it the preferred choice of middleware for new and many existing sites particularly in Europe and Asia. ARC and its Control Tower allow seamless access to heterogeneous resources: Grid, High Performance Computers and Clouds. Moreover, ATLAS@home, based on BOINC and ARC, allow to access opportunistic resources made of personal computers.

We propose master thesis subjects on development of new computing software tools, distributed data management systems, and data models that will address the challenges of future LHC extreme conditions. This involves various aspects of software development including modern techniques making use of machine learning and anomaly detection. The importance of Multi-variate analysis or "Machine Learning" in High Energy Physics continues to increase, for applications as diverse as reconstruction, physics analysis, data quality monitoring and distributed computing.
