Electron injection using a density downramp
decrease in phase velocity facilitates controlled injection

Simulation set-up
simulation tools and parameters

Effect of laser spotsize and density gradient
influence on energy gain, charge and energy spread

Conclusions and next steps

The phase velocity of the wake decreases with density triggering injection of plasma electrons

Wake phase velocity

$$v_{\phi}(z, t) = \frac{v_d}{1 - (d\omega/dz)\omega_p^{-1}(v_d t - z)}$$

For $r_m \gg c/\omega_p$ $\lambda_{wake} \approx 2r_m \approx 4\sqrt{\Lambda}c/\omega_p$

$$v_{\phi} \approx v_d \left(1 - 4\sqrt{\Lambda} \frac{d\omega_p^{-1}}{dz} \right)$$

Electron injection using a density downramp
decrease in phase velocity facilitates controlled injection

Simulation set-up
simulation tools and parameters

Effect of laser spotsize and density gradient
influence on energy gain, charge and energy spread

Conclusions and next steps

osiris framework

- Massively Parallel, Fully Relativistic Particle-in-Cell (PIC) Code
- Visualization and Data Analysis Infrastructure
- Developed by the osiris.consortium
⇒ UCLA + IST

code features

- Scalability to ~ 1.6 M cores
- SIMD hardware optimized
- Parallel I/O
- Dynamic Load Balancing
- QED module
- Particle merging
- GPGPU support
- Xeon Phi support

Long distance LWFA (10-100 m)

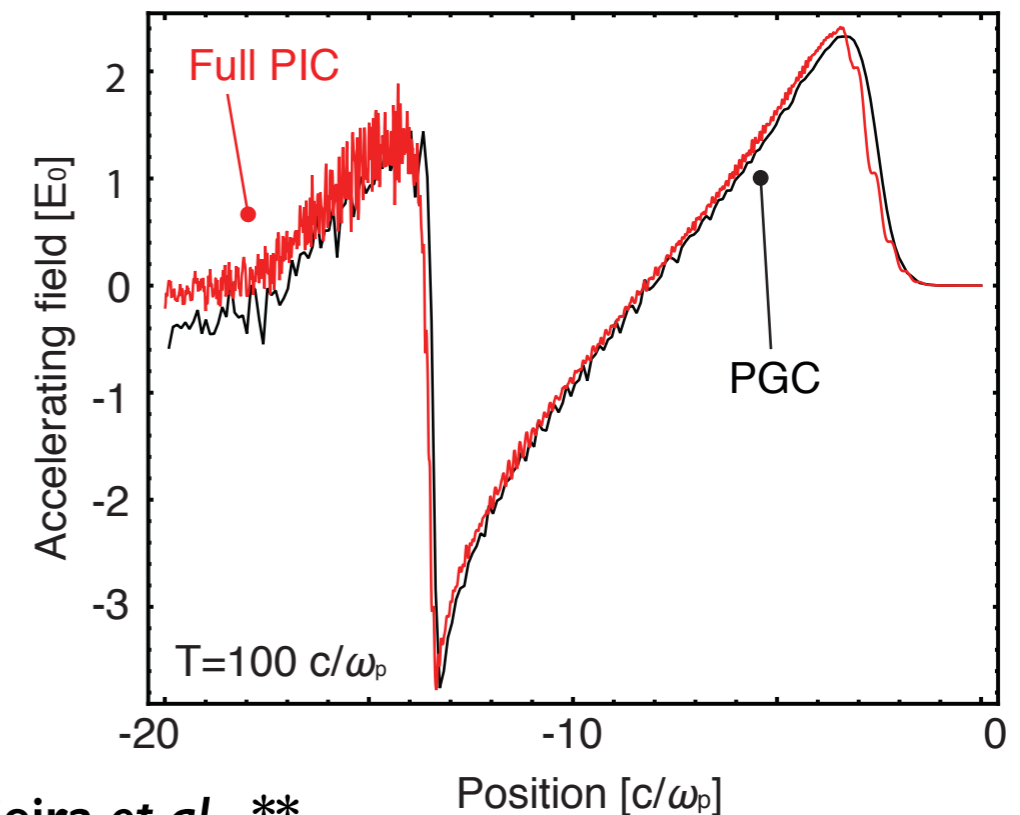

Significant challenges for PIC codes

- ◆ Large disparity of spatial scales
propagation distance/ laser
wavelength
- ◆ Algorithm must resolve the smallest
scale in the simulation
- ◆ High resolution, large iteration count

PGC approximation

- ◆ Models laser envelope propagation
- ◆ Push particles using self consistent
plasma fields and ponderomotive
force

PGC in OSIRIS

J. Vieira et al., **

Features

- ◆ Speed up $\sim (\omega_0/\omega_p)^2$
- ◆ Boosted frame like computational savings
- ◆ Ultra-fast LWFA simulations
- ◆ Ionization energy depletion
- ◆ 3D, 2D slab/ 2D cylindrical

Setup for LWFA with down ramp injection using PGC algorithm with varying laser spot size

$a_0 = 2.83$
 $W_0 = (5; 0.5;$
 $10)\mu\text{m}$
 $\tau = 25\text{fs}$

Plasma density profile

Focal plane

Plasma e^- density [cm^{-3}]

Electron injection using a density downramp
decrease in phase velocity facilitates controlled injection

Simulation set-up
simulation tools and parameters

Effect of laser spotsize and density gradient
influence on energy gain, charge and energy spread

Conclusions and next steps

$W_0 = 5\mu\text{m}$

$|\rho x_3 \text{ slice}|$

Time = 0.00 [1 / ω_p]

$W_0 = 7\mu\text{m}$

$|\rho x_3 \text{ slice}|$

Time = 0.00 [1 / ω_p]

$W_0 = 5\mu\text{m}$

$|\rho x_3 \text{ slice}|$

Time = 198.75 [1 / ω_p]

Accelerating field has a sharp gradient

$W_0 = 7\mu\text{m}$

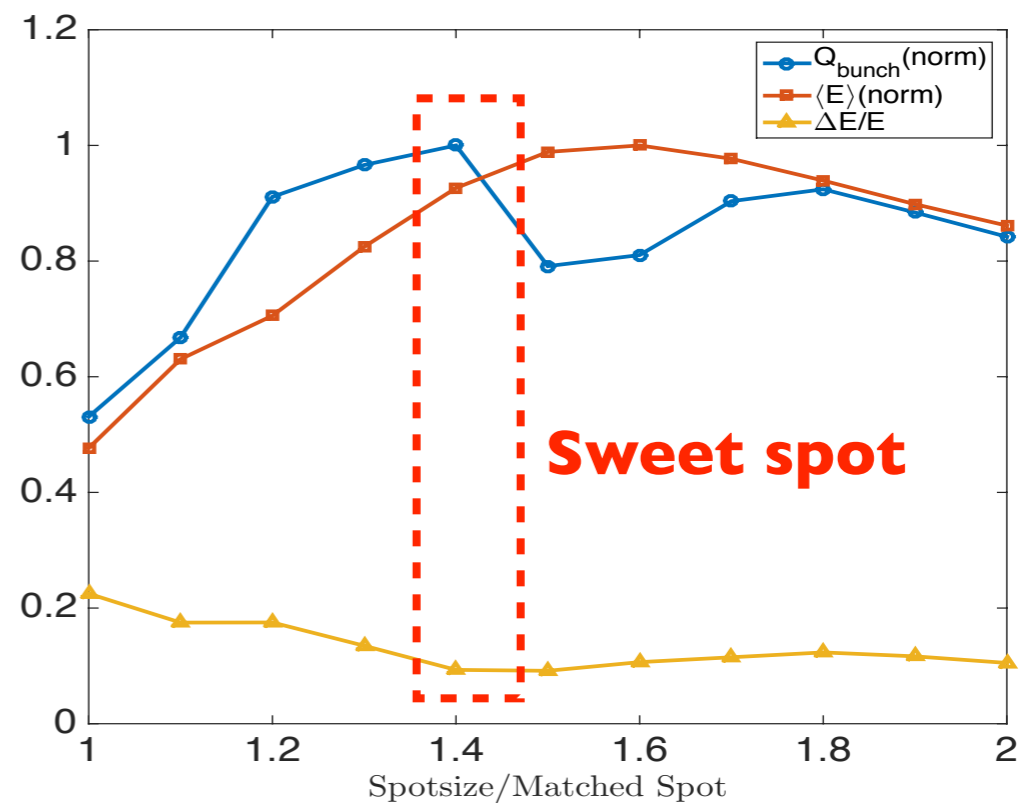

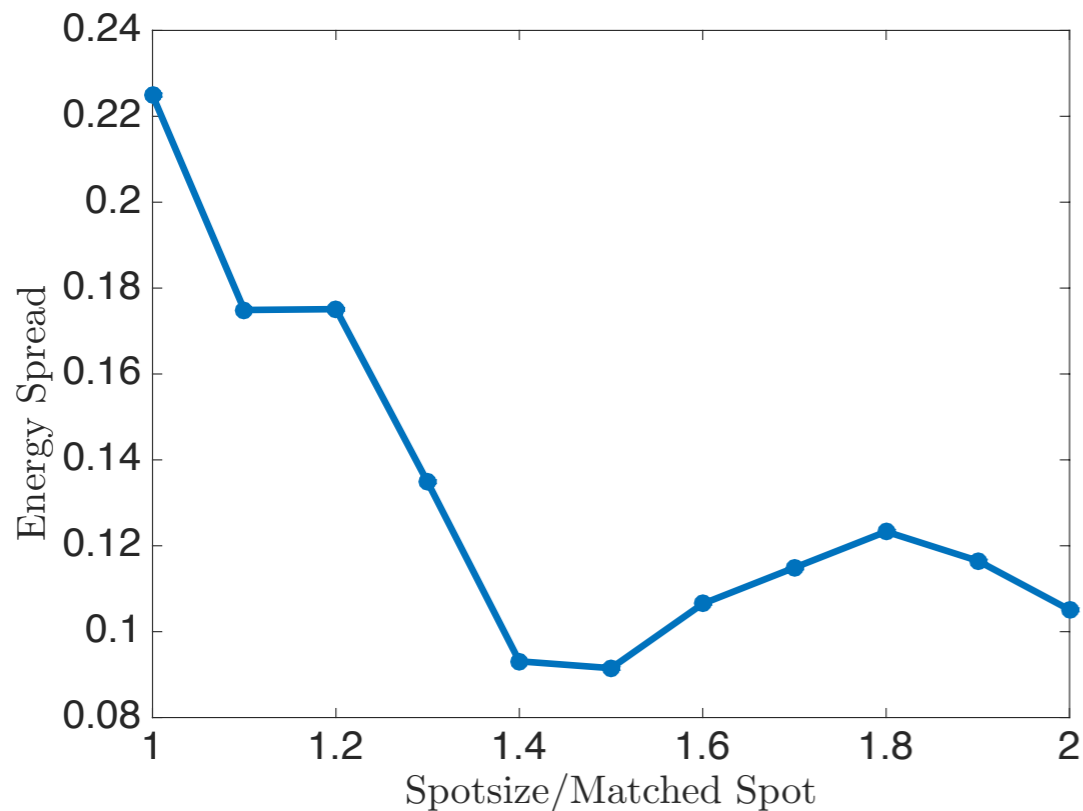

$|\rho x_3 \text{ slice}|$

Time = 198.75 [1 / ω_p]

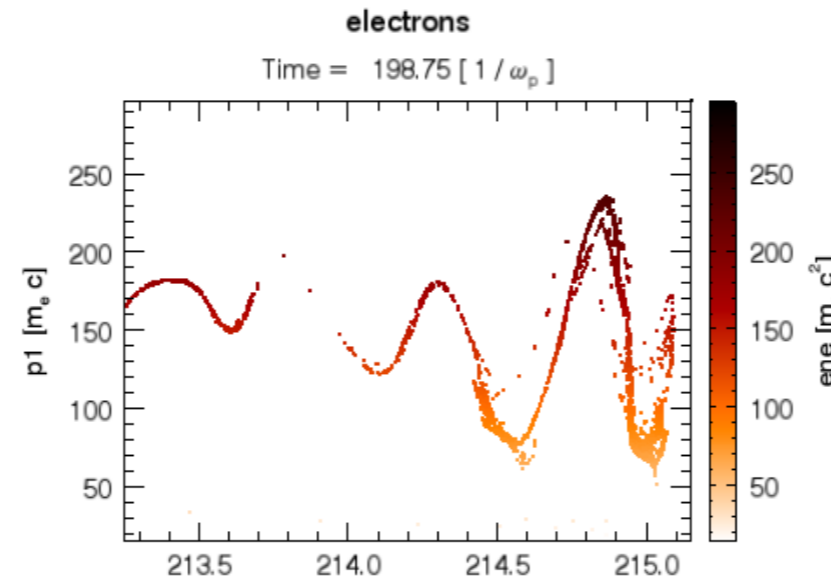

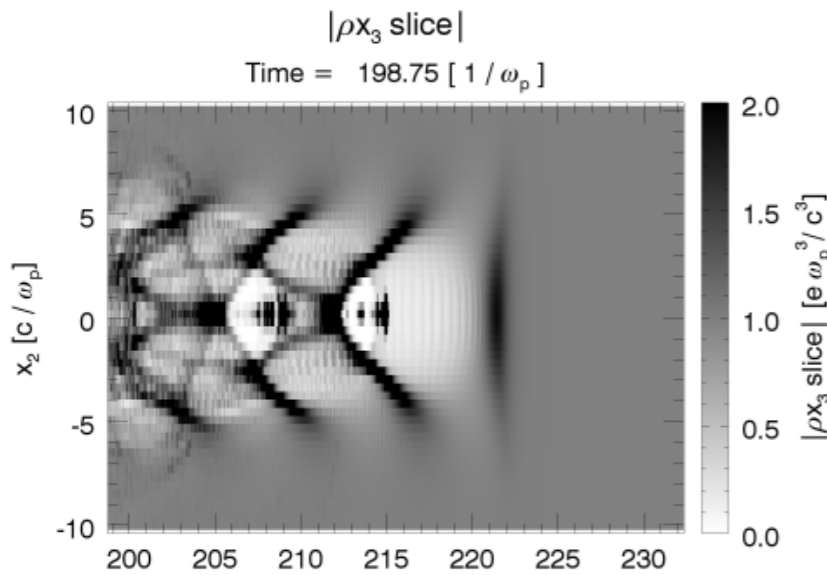

Accelerating field has relatively flat gradient

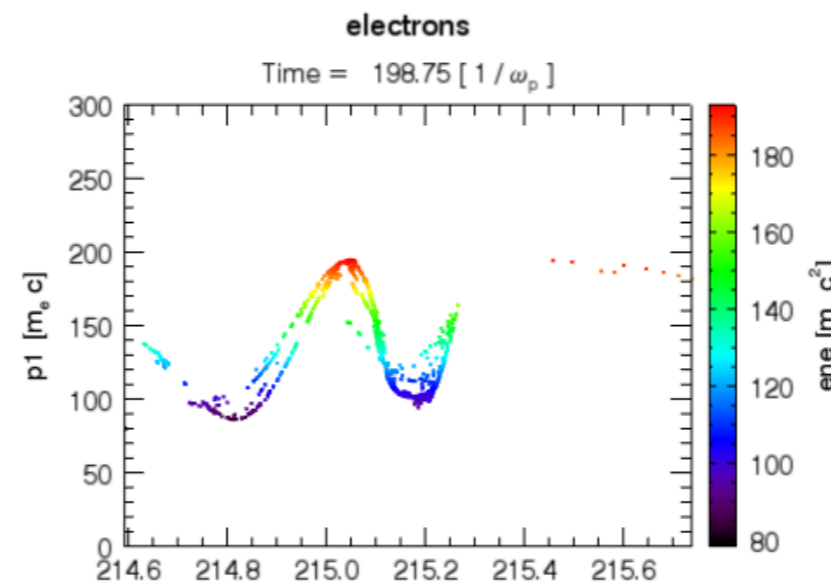

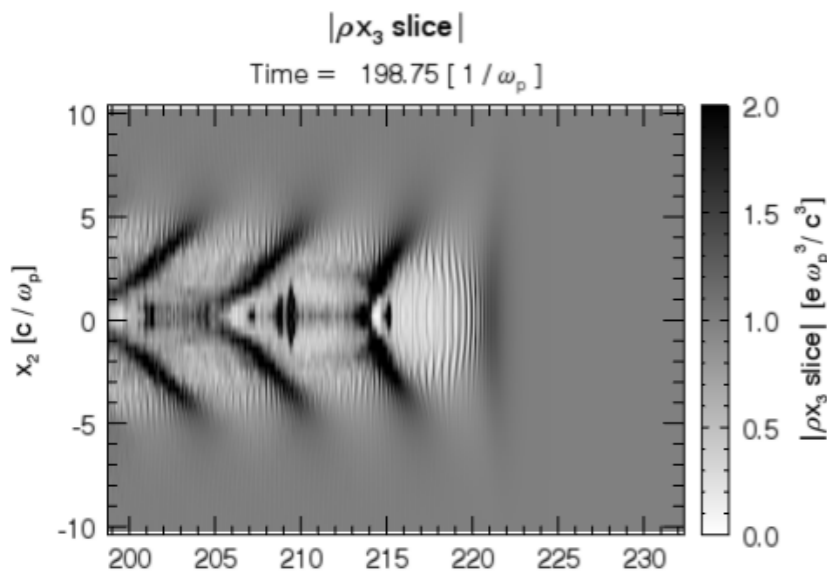

Varying laser spotsize (keeping peak intensity and duration const.) affects average energy, energy spread and charge

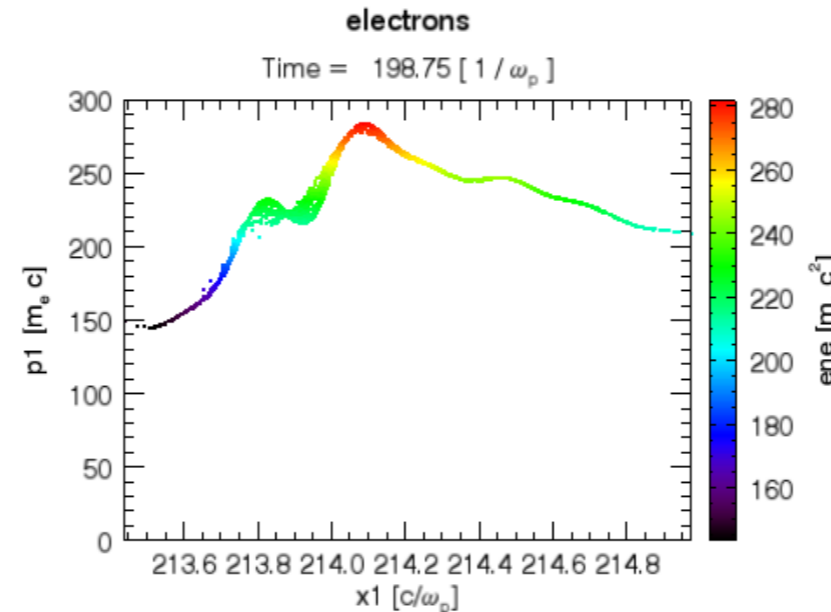

Varying spotsizes instead of power is more effective in reducing the energy spread

$a_0=3.962$ (Power= 8.4×10^{12} Watts)
 $W_0=5 \mu\text{m}$
 $\langle E \rangle = 42.3948 \text{ MeV}$
 $\Delta E / \langle E \rangle = 125.779 \%$
 $Q_{\text{bunch}}=490.657 \text{ pC}$

$a_0=2.83$ (Power= 4.3×10^{12} Watts)
 $W_0=5 \mu\text{m}$
 $\langle E \rangle = 121.47 \text{ MeV}$
 $\Delta E / \langle E \rangle = 22.49 \%$
 $Q_{\text{bunch}}=43.26 \text{ pC}$

$a_0=2.83$ (Power= 8.4×10^{12} Watts)
 $W_0=7 \mu\text{m}$
 $\langle E \rangle = 236.10 \text{ MeV}$
 $\Delta E / \langle E \rangle = 9.31 \%$
 $Q_{\text{bunch}}=81.49 \text{ pC}$

The plasma density is decreased linearly from n_{ph} to n_{p0} keeping the downramp length constant, i.e. $L=33.5\mu\text{m}$. n_{ph} is varied from $1e19\text{cm}^{-3}$ to $2e19\text{cm}^{-3}$ and n_{p0} from $0.5e19\text{cm}^{-3}$ to $1.5e19\text{cm}^{-3}$ keeping $\delta n = n_{ph} - n_{p0} = 0.5e19\text{cm}^{-3}$

Varying n_{ph} and n_{p0} with dn/ndx const.

Electron injection using a density downramp
decrease in phase velocity facilitates controlled injection

Simulation set-up
simulation tools and parameters

Effect of laser spotsize and density gradient
influence on energy gain, charge and energy spread

Conclusions and next steps

Simulations with varying laser spotsize suggest

At 1.4 times of the matched laser spotsize, the accelerated electrons have high energy, have high charge and a very small energy spread $\sim 9\%$

Simulations with varying n_{ph} and n_{p0} keeping the density scale length constant

The average energy of the electrons increases till $n_{ph}=1.9$ and then decreases

The energy spread decreases with $n_{ph}=1.8$ and then increases by a small amount

Future work

Simulations with varying spot size for $n_{ph}=1.8$ and $n_{p0}=1.3$, as the energy spread is minimum at these values of density.

The effect of spotsize on energy spread needs to be theoretically investigated
