Tuesday, March 14th 2017
Session: Future Studies
20th ATF2 Project Meeting, CERN

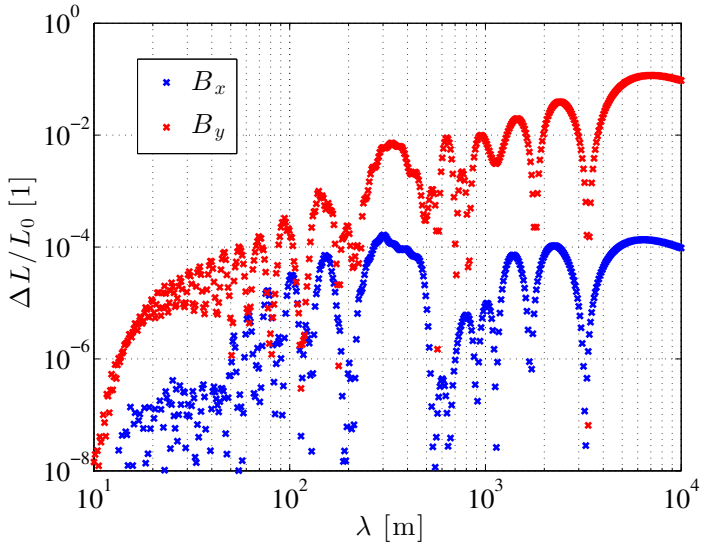
Outline

MOTIVATION

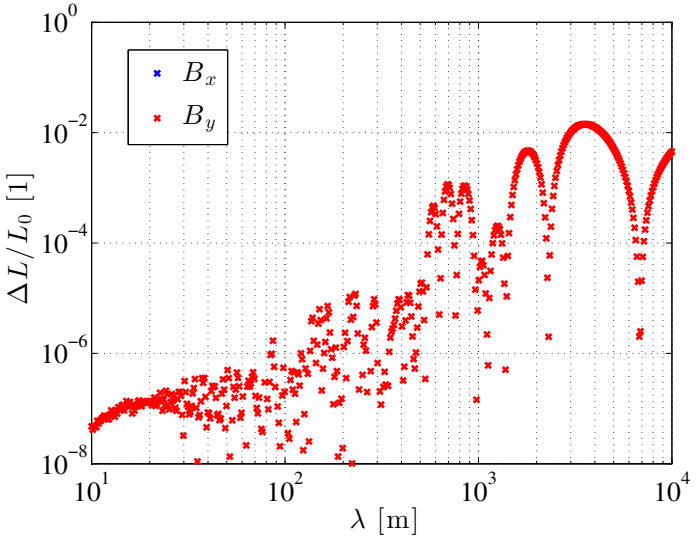
CLIC-BDS Sensitivity to Stray Fields

- In 2010 simulation study of stray field impact on CLIC †
  - Tolerance of ≈nT for the BDS (collimation section)
  - Mitigation techniques (shielding, feed-forward system)
  - Lack of measurements on equipment
- Presently J. Pfingster calculations confirm tolerances and critical sections to Stray Field variations

Due to position offset



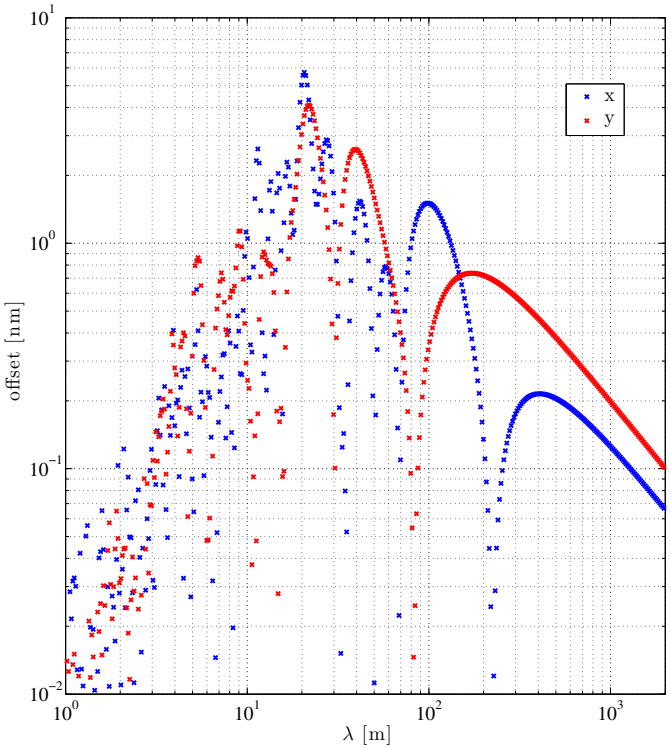
Due to angle offset



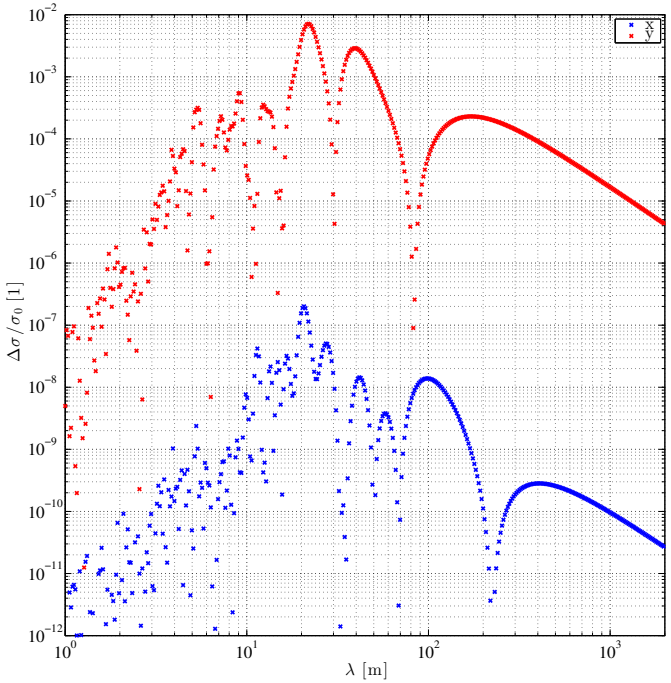
† J. Snuverink et al, WEPE023, IPAC'10

ATF2 Sensitivity to Stray Fields

Beam Offset



Rel. Beam size growth



- Assumed ΔB=1 nT
- Vertical beam position offset of 4 nm at $\lambda \approx 22$ m
- $\frac{\Delta\sigma_y^*}{\sigma_{y0}^*}$ of 0.8% at $\lambda \approx 22$ m

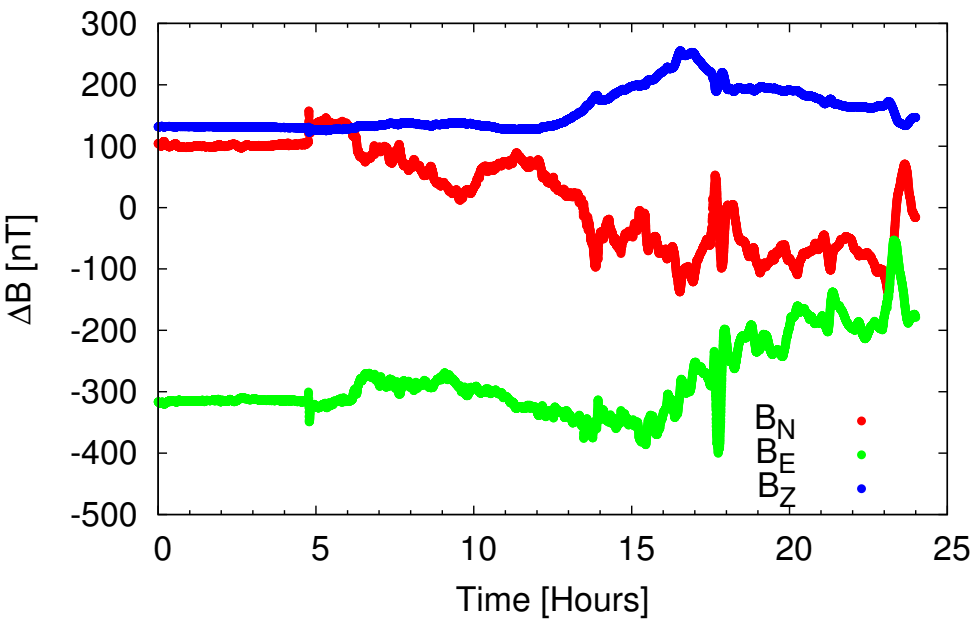
†

†Calculations done by J. Pfingster

Magnetic Field Variation

- Natural Magnetic Fields (Earth's field, geomagnetic storm)
- $\vec{B}$-fields due to technical equipment

- Geomagnetic storm at Tihany Geophysical Observatory [a]
- Magnetic field expressed in *XYZ* components (X-North, Y-Eastern, Z-Vertical)
- Max. $\Delta\vec{B}$ observed during severe storm $\approx \mu$T (infrequent and predictable)



[a] similar latitude as Geneva

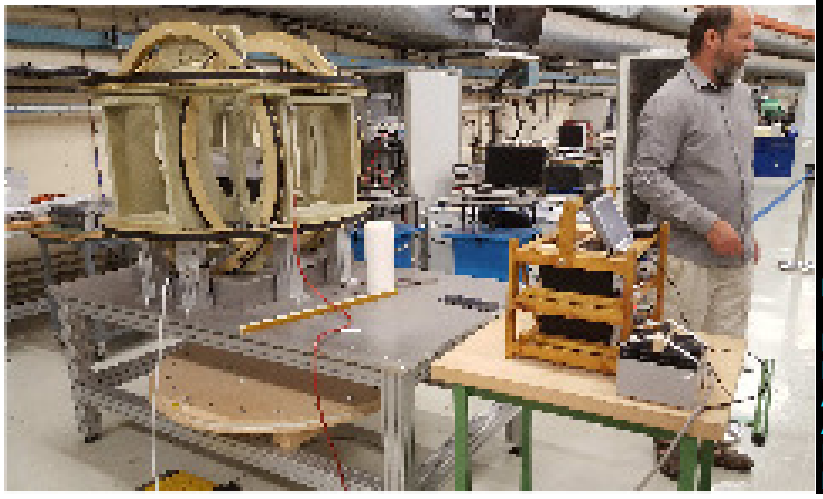
STRAY FIELD MEASUREMENTS @ CERN

Measurement Set-up



LEMI-035 magnetometer

MAIN TECHNICAL PARAMETERS

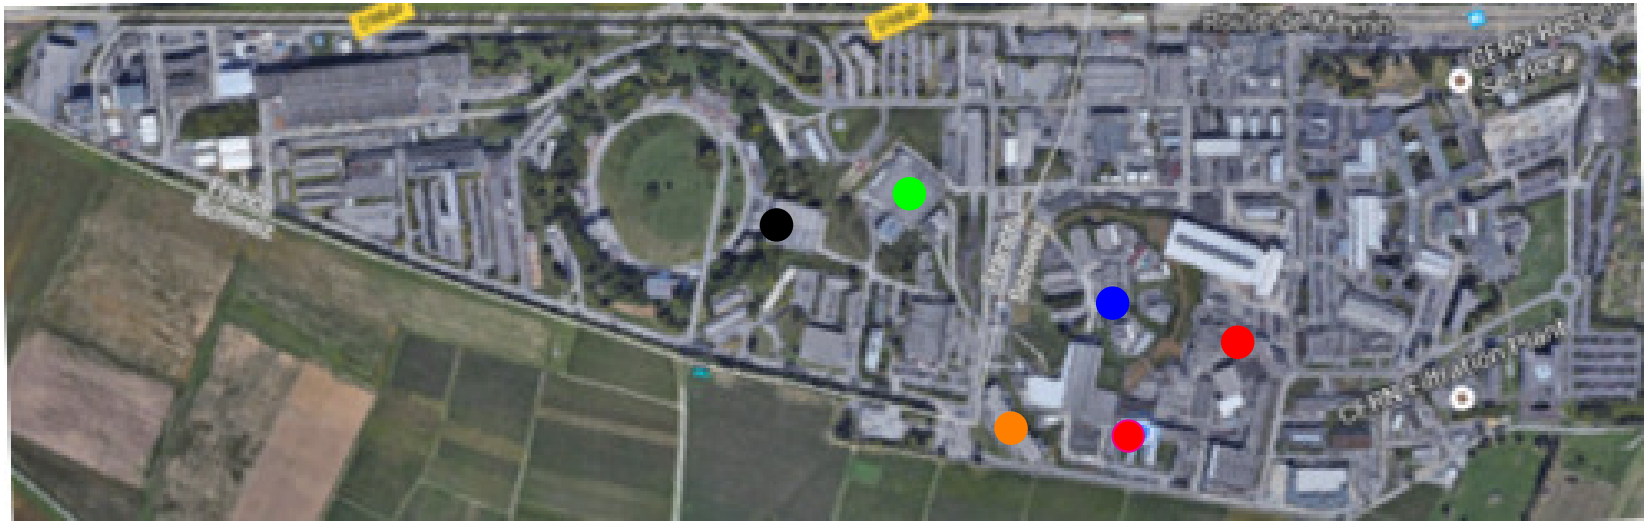
Measurement range	± 70000 nT
Magnetic field variation range (w/o additional compensation)	± 1000 nT
Analog output sensitivity	5 mV/nT
Analog output range	± 4.8 V
Frequency band, 4th order Butterworth low-pass filter	0…20 Hz
Noise level at 1 Hz	< 10 pT

- Compact, portable and easy to set-up
- Specifications are not perfectly fitted to our requirements
  - Data acquisition at 128 Hz
  - Filter cut-off of the magnetometer is at 20 Hz
  - **Not operational under radiation**

Scenes

- 1^{st} measurement campaign: 20/06/2016-29/06/2016
- 2^{nd} measurement campaign: 16/01/2017-20/01/2017

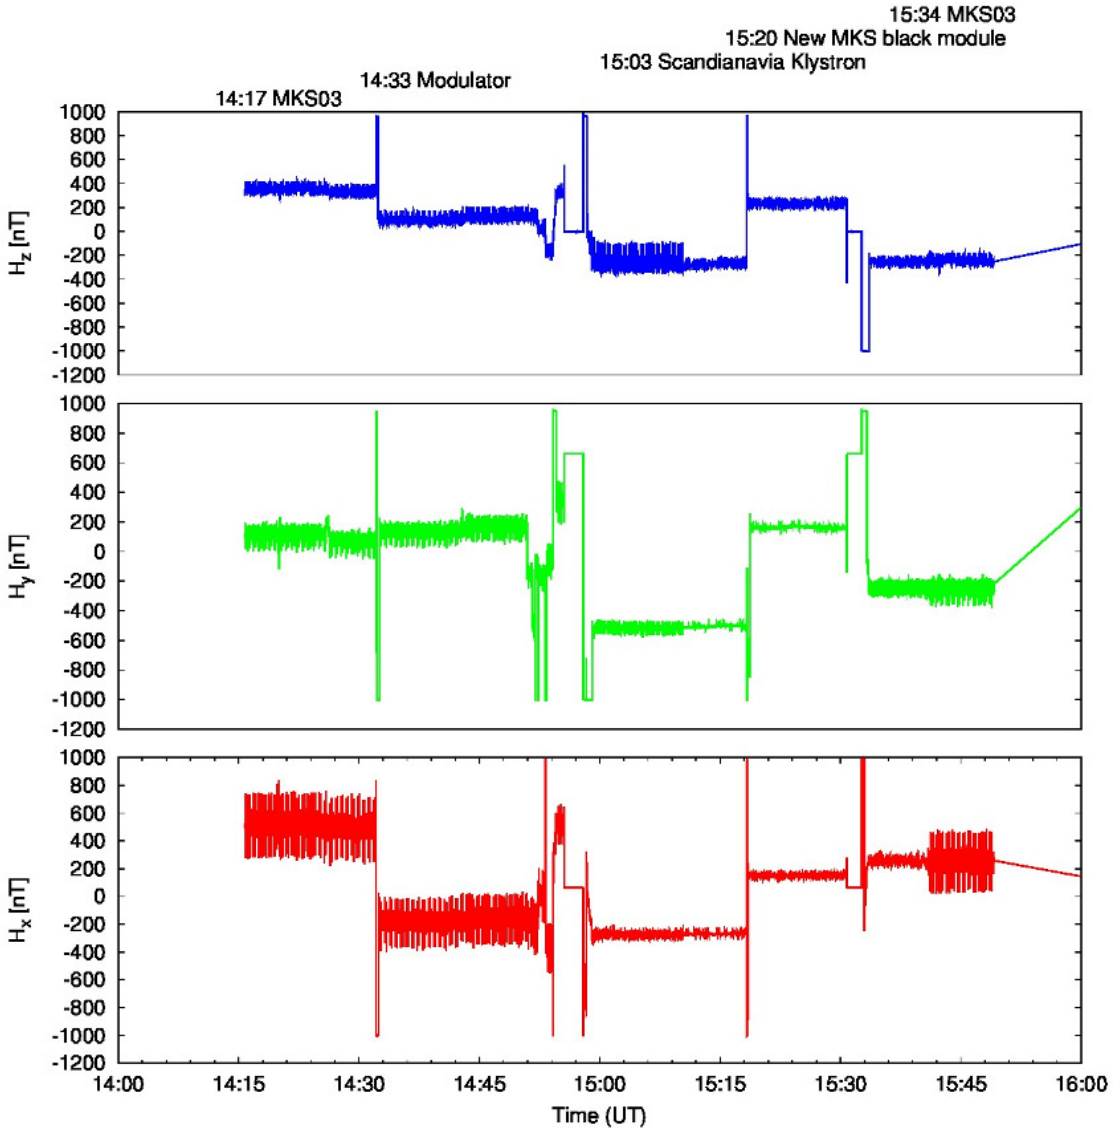
- CTF3
- AD Hall
- PS Ring
- PACMAN
- XBOX
- LINAC-4



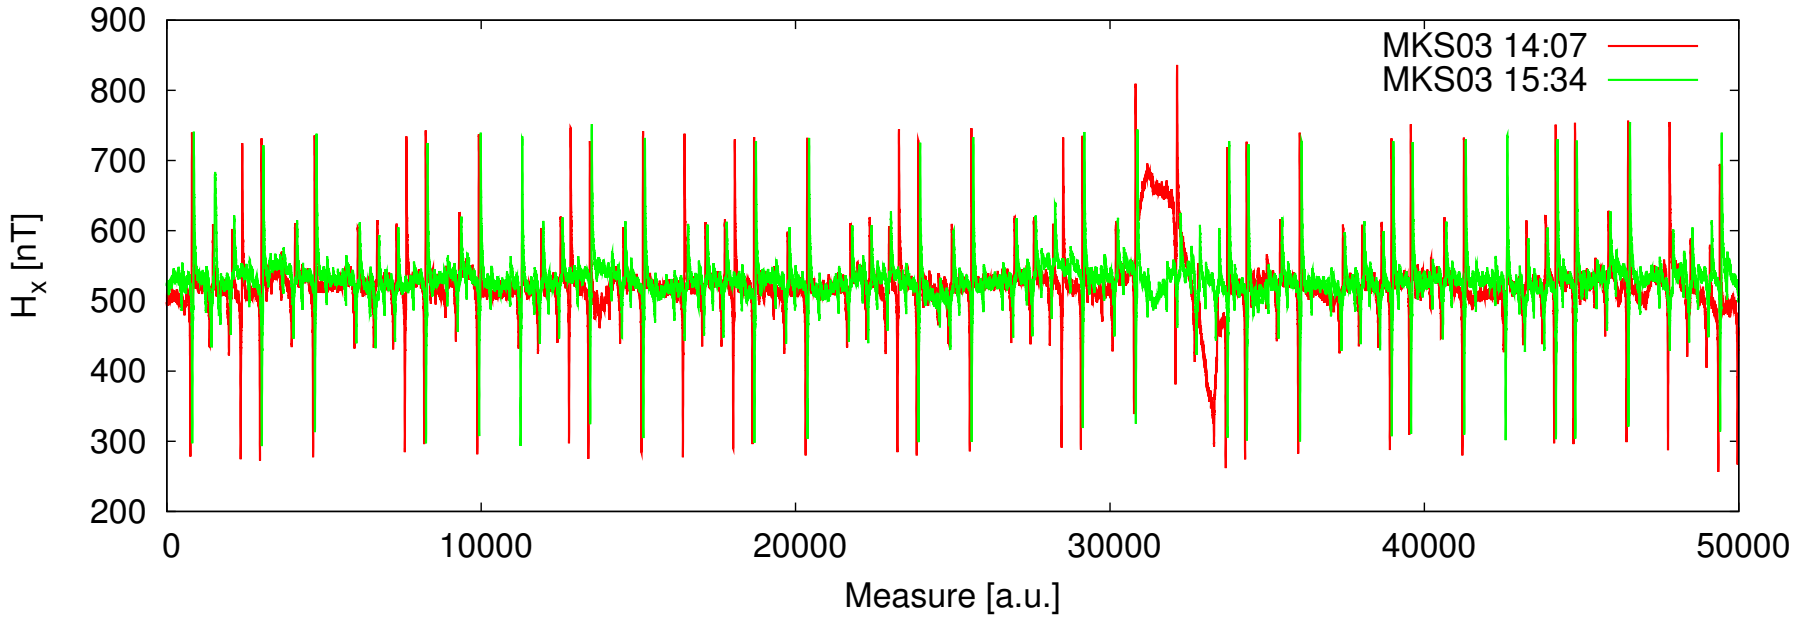
CTF3

Measurement at the Klystron Gallery

- MKS03
- Modulator
- Scandinavia
- New MKS
- MKS03



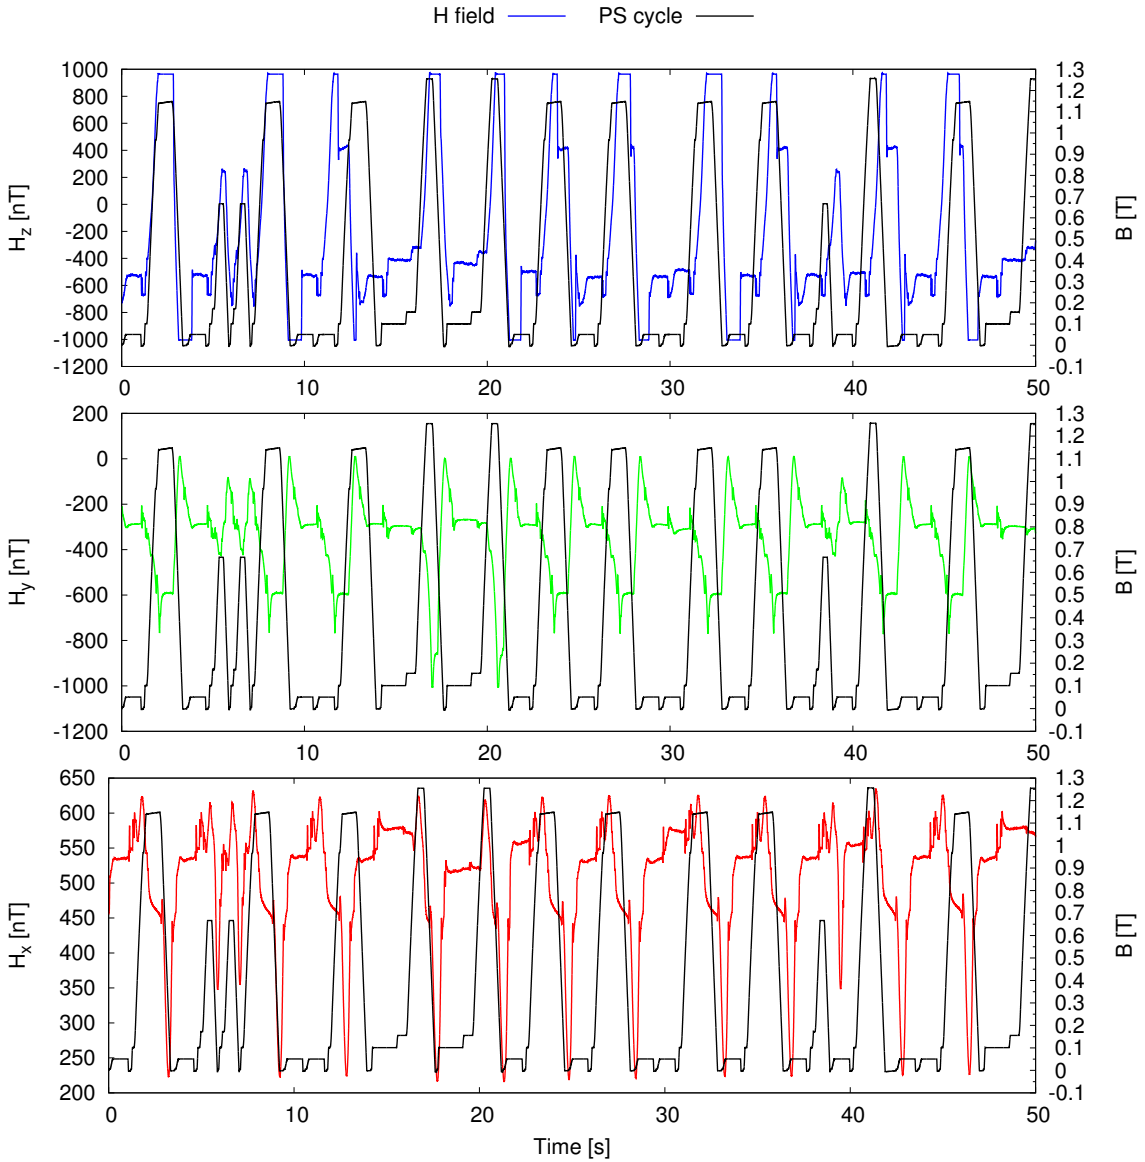
A common pattern was observed at all locations



Is this coming from the PS?

Protron Synchrotron Pulsing

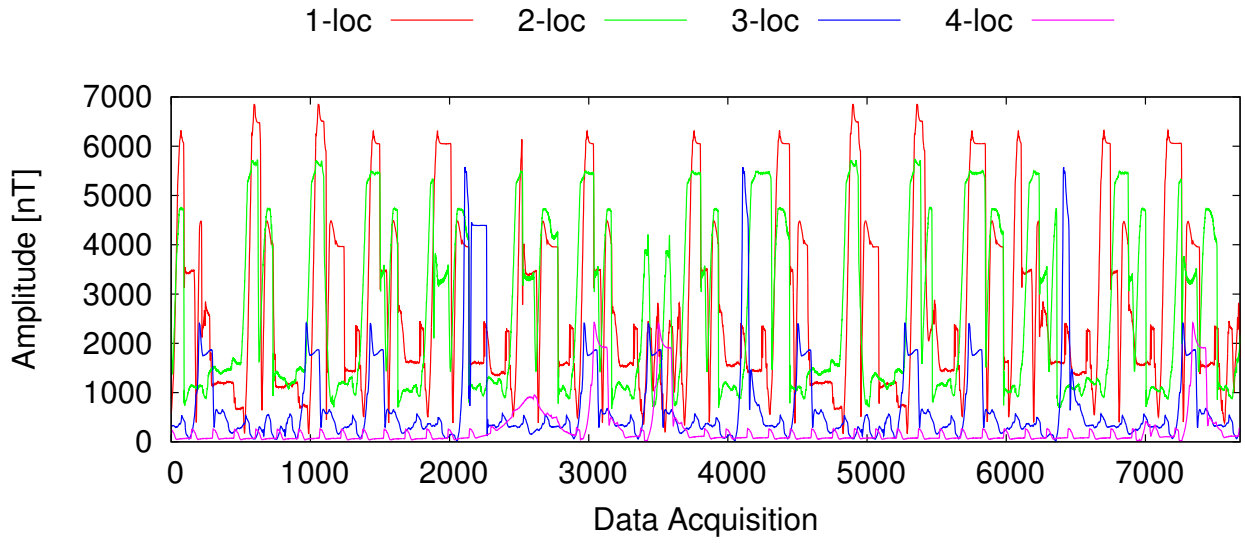
Clear correlation between measured signal and PS cycle

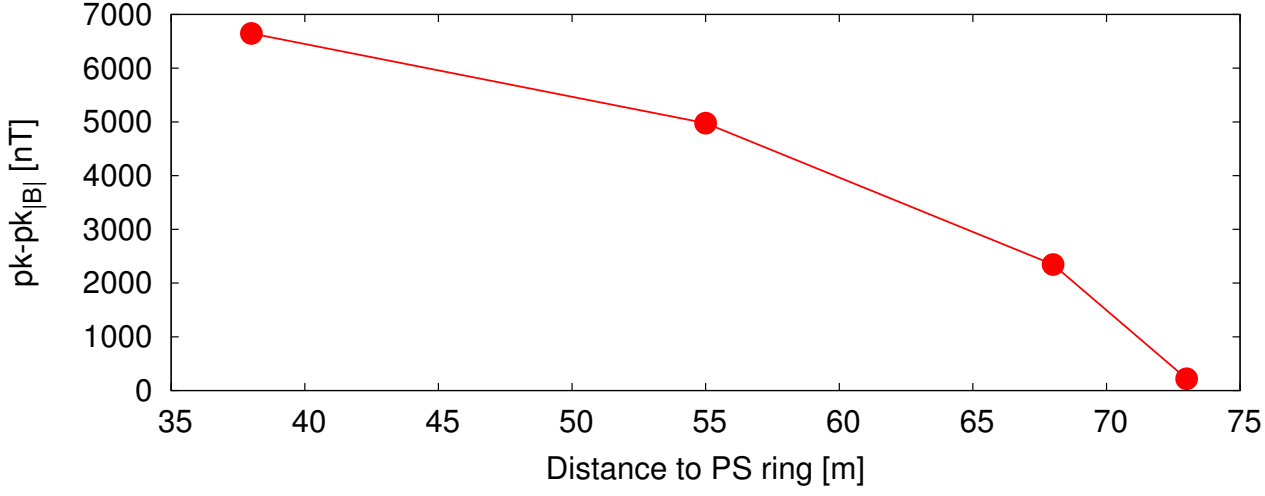


Proton Synchrotron

		Measurement Spots			
		L1	L2	L3	L4
Distance to center	[m]	62	45	31	27
Duration	[min]	12	9	2	5

Clear correlation between measured signal and PS cycle

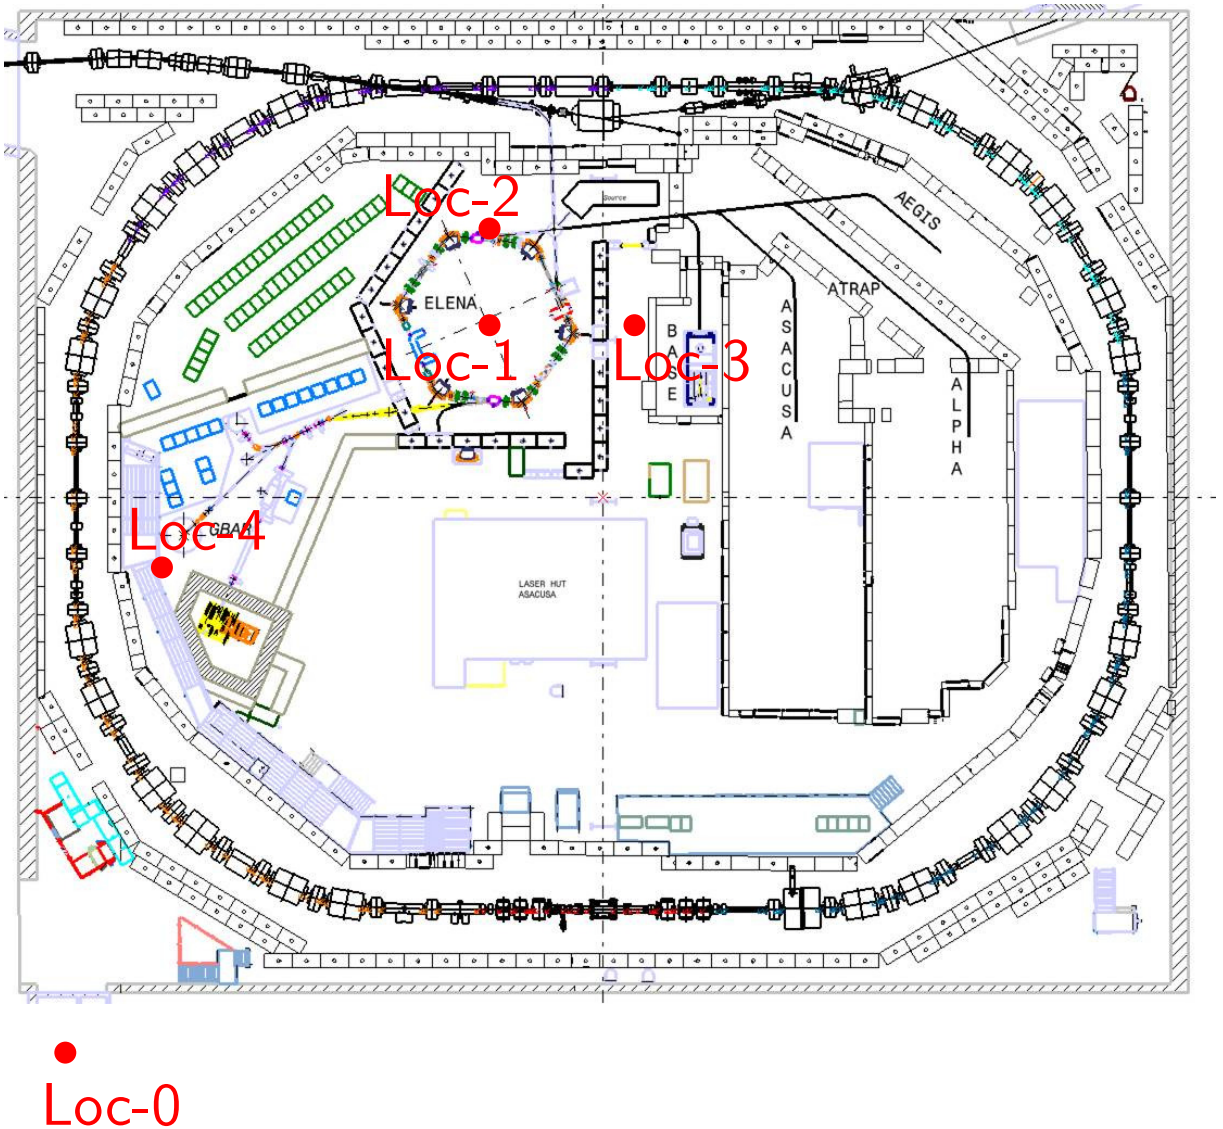




Signal is attenuated as we move towards PS center

Antiproton Decelerator

AD Locations



Antiproton Decelerator

Baseline measurement was taken outside bldg. 193 (Loc-0). Time[†] lapse: 12:27- 12:40

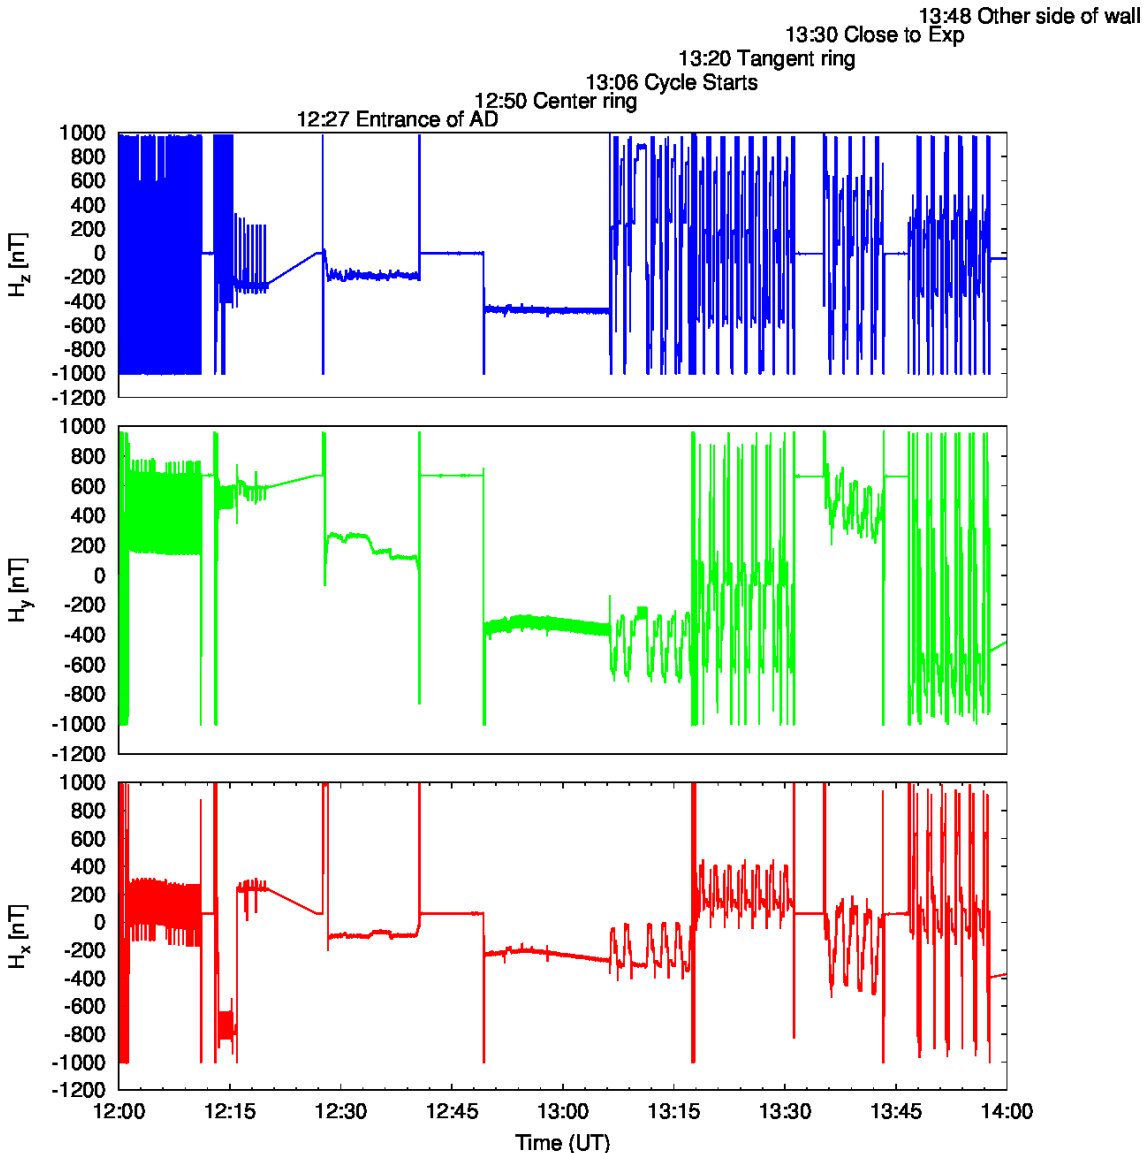
4 addtitional locations were considered for measurements inside the AD hall;

- Center of ELENA ring (Loc-1)
  - Cycling OFF (Time lapse: 12:50-13:06)
  - Cycling ON (Time lapse: 13:06-13:18)
- Tangent of the Ring (Loc-2)
  (Time lapse: 13:20-13:30)
- Close to Experiment (Loc-3)
  (Time lapse: 13:36-13:43)
- Close to AD ring (Loc-4)
  (Time lapse: 13:48-13:58)

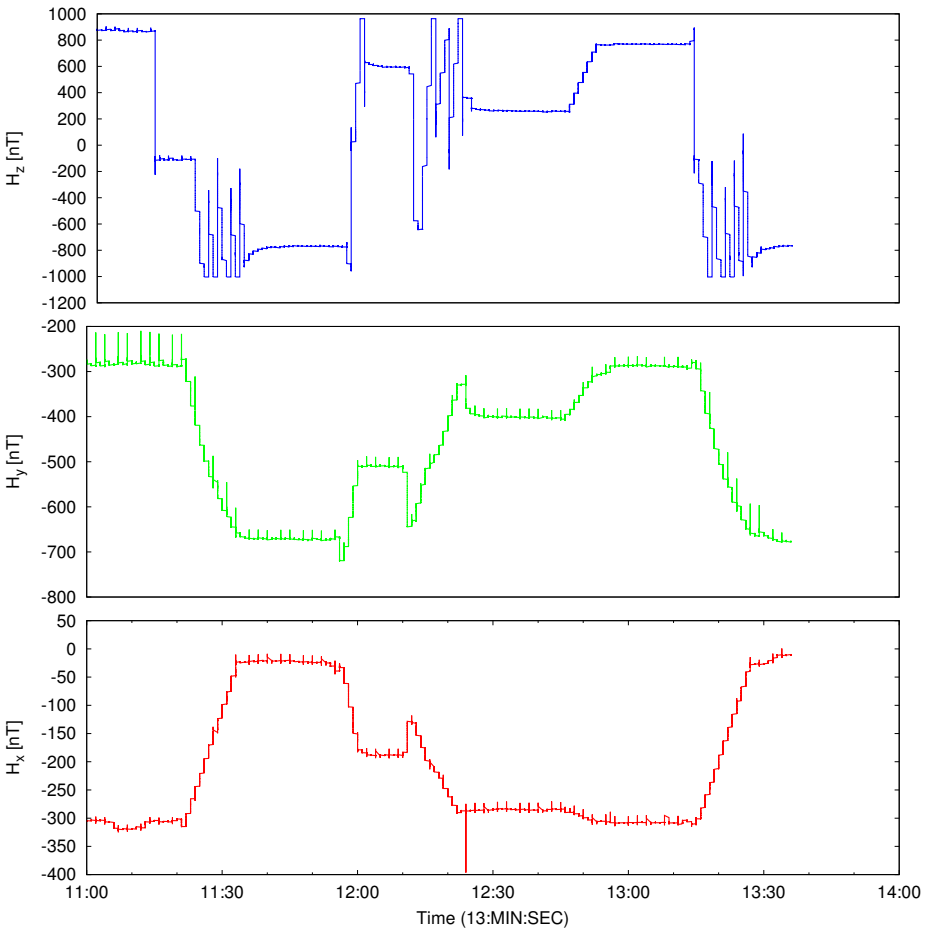
[†]UTC time

Measurement

Observed variations of few μT when AD is pulsing

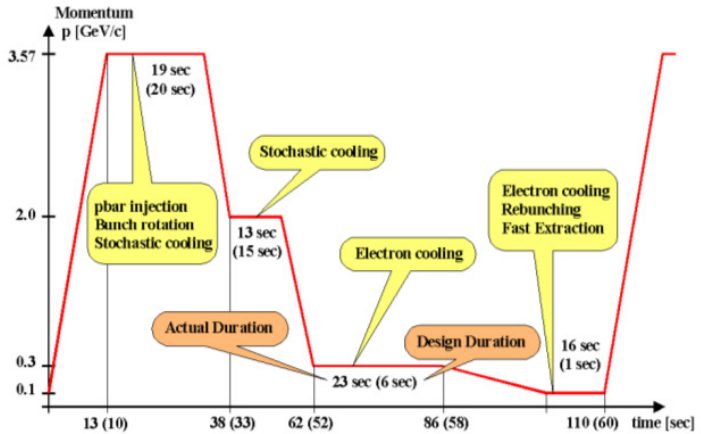


Zoom In @ Loc-1



†

Sketch of AD magnetic cycle†
Expected duration ≈60 s



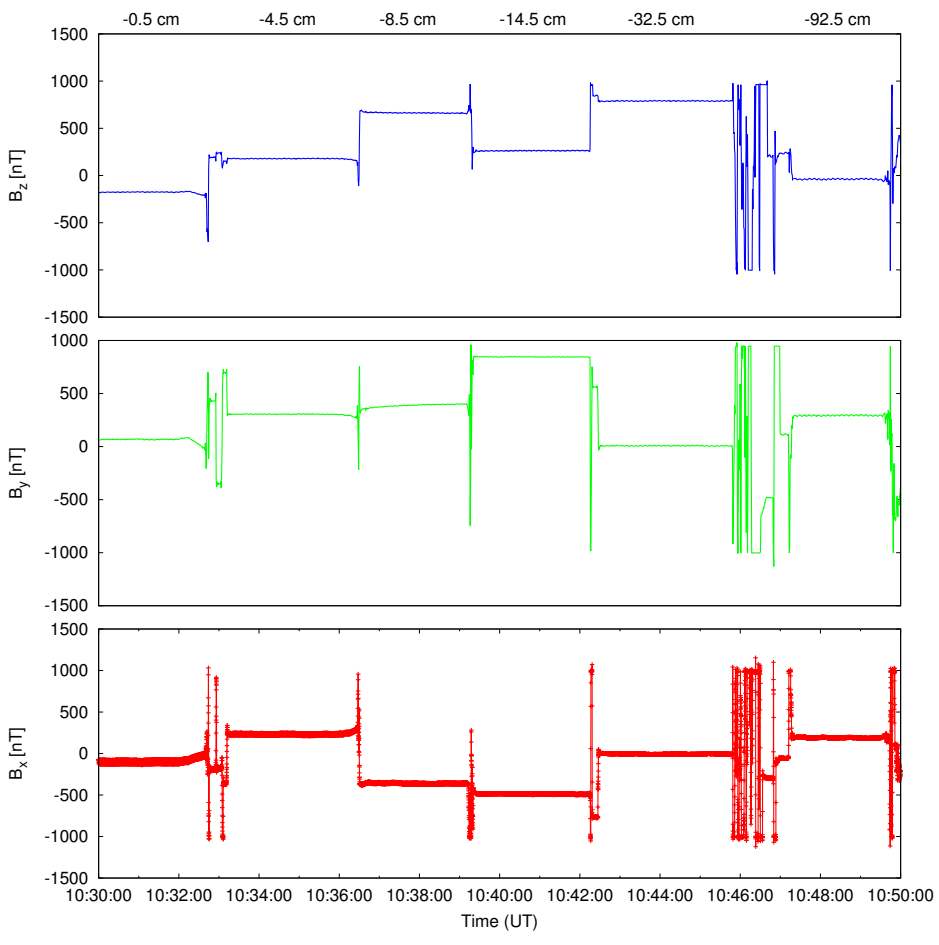
†Figure taken from *Status and Prospects for the AD and ELENA*, Lars V. Jorgensen / CERN / BE-OP

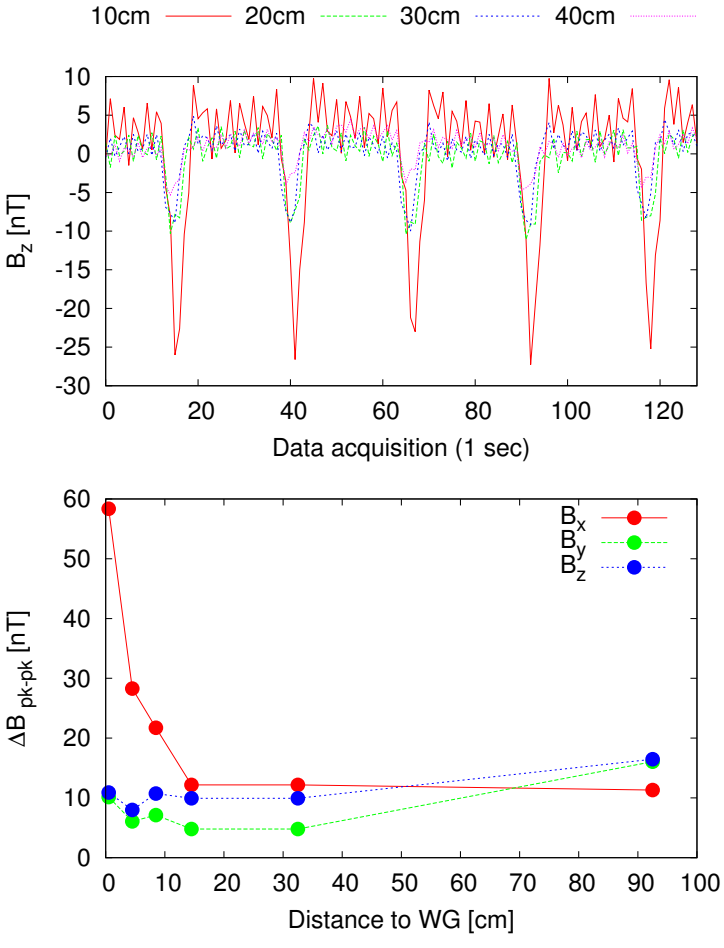
XBOX

XBOX

Klystron-C&D

- Measurements on 19/01/2017: Distance scan (vertically). Sensor was below the waveguide. X-axis perpendicular to waveguide





Shielding

- Shield waveguide (soft-μ-material)
- Shield sensor (Aluminium pipe, soft-μ-material)

Scenario	Starting Time	Finishing Time	Observations
	[H:M:S]	[H:M:S]

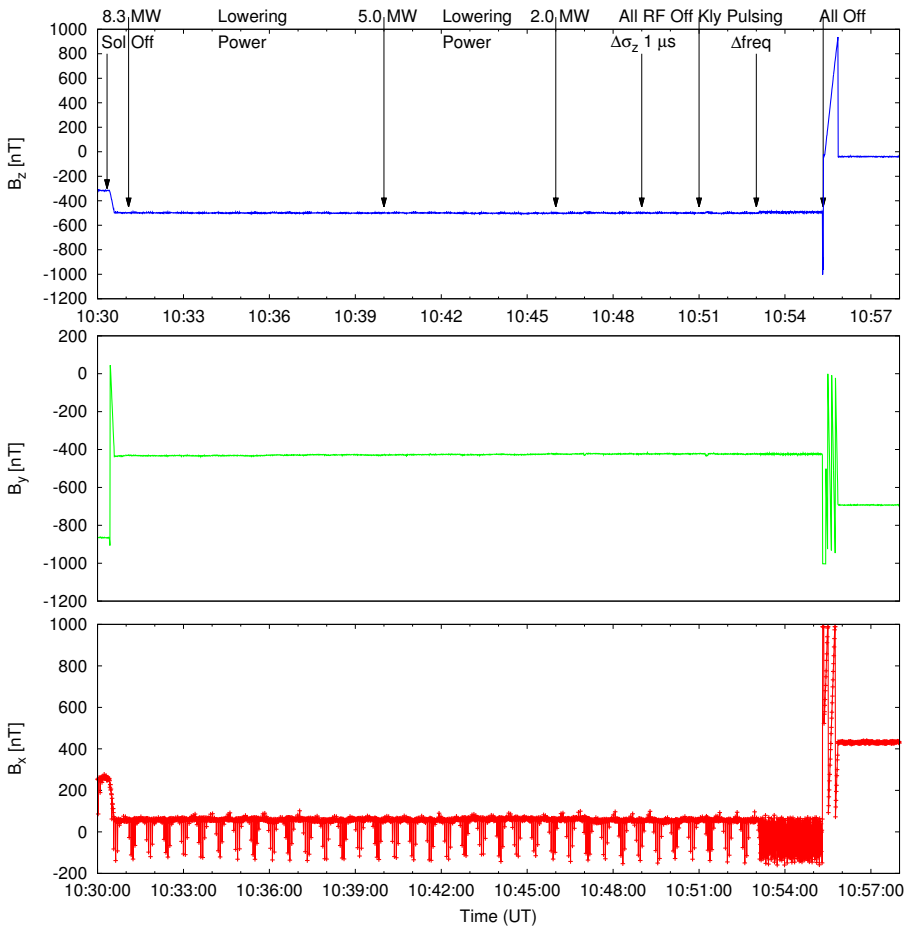
Scenario

Source

- Power scan
- Pulse width scan
- On/Off low-level RF
- On/Off Solenoid



ΔB_{p2p} measured would be consistent with a current of 13 mA (assuming an infinitely straight current)

CONCLUSIONS & PROSPECTS

Conclusions & Prospects

- CLIC-BDS is most sensitive to wavelength (≈7 km), 12% $\mathcal{L}_{\text{loss}}$ for 1 nT amplitude stray field variation without any countermeasure
- ATF2-FFS is most sensitive to wavelength (≈25 m), $\frac{\Delta\sigma_y^*}{\sigma_{y0}^*}$ ≈0.8% for 1 nT amplitude variation
- Natural and man-made magnetic field sources are well-above that tolerance at Earth's surface

- Variations of $\geq \mu T$ are observed at CTF3 due to the PS cycle
- Variations of tens of nT are observed closed to the waveguides
  - Signal can be effectively shielded with a soft-μ material

- Acquire and/or develop additional sensors
- Developing strategies for mitigating intolerable $\vec{B}$ variations
  - Compensation schemes: active and/or passive
- Could the ATF2 facility be a potential location for testing such a compensation system?
