

# *Field Theory & EW Standard Model*

## *Lecture I*

Andrej Arbuzov

JINR, Dubna, Russia

The 2017 European School on High Energy Physics  
Evora, Portugal, 6 - 19 September 2017

# Outline

## *Lecture 1: Introduction and QFT*

- ▶ What is the Standard Model?
- ▶ Particle (field) content of the SM
- ▶ Principles of the SM
- ▶ Brief notes on Quantum Field Theory

## *Lecture 2: Construction of the SM*

## *Lecture 3: Phenomenology of the SM*

## What is the Standard Model?

*The SM is*

- ▶ — the most successful physical model ever
- ▶ — constructed within the Quantum Field Theory (QFT)
- ▶ — based on symmetry principles
- ▶ — minimal
- ▶ — a model with an enormous predictive power

But we do not understand **why** it works so well. . .

*Questions to the SM:*

- ▶ Is the SM a fundamental theory?
- ▶ If not, where is the limit of its applicability?
- ▶ Are the fields and interactions of the SM fundamental?
- ▶ Can it be joined with gravity?
- ▶ Does it give hints where to look for anything beyond it?

# Particle (field) content of the SM (I)

mass →	$\approx 2.3 \text{ MeV}/c^2$	$\approx 1.275 \text{ GeV}/c^2$	$\approx 173.07 \text{ GeV}/c^2$	0	$\approx 126 \text{ GeV}/c^2$
charge →	2/3	2/3	2/3	0	0
spin →	1/2	1/2	1/2	1	0
	<b>u</b> up	<b>c</b> charm	<b>t</b> top	<b>g</b> gluon	<b>H</b> Higgs boson
<b>QUARKS</b>	$\approx 4.8 \text{ MeV}/c^2$	$\approx 95 \text{ MeV}/c^2$	$\approx 4.18 \text{ GeV}/c^2$	0

## Particle (field) content of the SM (fermions)

So we have (i.e. observe)

**fermions** (spin = 1/2) and **bosons** (with spin = 0 or 1)

Fermions are of two types: **leptons** and **quarks**. They are:

— 3 charged leptons ( $e, \mu, \tau$ );

— 3 neutrinos  $\nu_e, \nu_\mu, \nu_\tau$  (or  $\nu_1, \nu_2, \nu_3$ , see lect. by S. Davidson)

— 6 quarks of different **flavors**, see lect. by M. Beneke;

Each quark can have one of three **colors**, see lect. by K. Melnikov;

Each fermion has 2 degrees of freedom, e.g. can be **left** or **right**

Each fermion particle has an **anti-particle**,  $f \neq \bar{f}$

**N.B.1.** The later was not yet verified for neutrinos

**N.B.2.** Traditionally fermions are called *matter fields*

## Particle (field) content of the SM (bosons)

In the SM we have a few boson fields:

- 8 vector (spin=1) **gluons**
- 4 vector (spin=1) **electroweak bosons**:  $\gamma$ ,  $Z$ ,  $W^+$ ,  $W^-$
- 1 scalar (spin=0) **Higgs boson**

Gluons and photon are massless\* and have 2 degrees of freedom (polarizations)

Each gluon has one color and one anti-color

$Z$  and  $W$  bosons are massive\*\* and have 3 degrees of freedom (polarizations)

**N.B.1.** Gluons and EW bosons are gauge bosons which transmit\*\*\* interactions between matter fields

**N.B.2.** Electrically neutral bosons ( $H$ ,  $\gamma$ ,  $Z$ , and gluons) coincide with their anti-particles, e.g.  $\gamma \equiv \bar{\gamma}$

## Interactions in the SM (I)

How many fundamental interactions are there in Nature?

How many interactions are there in the Standard Model?

To answer the last question we have to look at the SM Lagrangian.

# Interactions in the SM (II)

The complete SM Lagrangian look quite long and cumbersome:

Exercise 1.1.1.1a: Given locality, causality, Lorentz invariance, and known physical data since 1960, show that the Lagrangian describing all observed physical processes (sans gravity) can be written:

$$\begin{aligned}
 & -\frac{1}{2}\partial_\mu\partial_\nu\partial_\rho\partial_\sigma\partial_\mu\partial_\nu\partial_\rho\partial_\sigma - g_5\frac{f^{abc}}{2}\partial_\mu\partial_\nu\partial_\rho\partial_\sigma\partial_\mu\partial_\nu\partial_\rho\partial_\sigma - \frac{1}{4}g_6^2\frac{f^{abcd}}{2}\partial_\mu\partial_\nu\partial_\rho\partial_\sigma\partial_\mu\partial_\nu\partial_\rho\partial_\sigma + \\
 & \frac{1}{2}g_7^2(\bar{\psi}^i\gamma^\mu\psi^j)g_8^2(\bar{\psi}^i\gamma^\mu\psi^j) + \bar{C}^a\partial^\mu C^a + g_9\frac{f^{abc}\partial_\mu}{2}\bar{C}^a C^b C^c + g_{10}\partial_\mu W_\mu^- - \\
 & M^2 W_\mu^+ W_\mu^- - \frac{1}{2}\partial_\mu Z_\mu^0 Z_\mu^0 - \frac{1}{2}M^2 Z_\mu^0 Z_\mu^0 - \frac{1}{2}\partial_\mu A_\nu\partial_\nu A_\mu - \frac{1}{2}\partial_\mu H\nu H - \\
 & \frac{1}{2}m_H^2 H^2 - \partial_\mu\phi^+\partial_\mu\phi^- - M^2\phi^+\phi^- - \frac{1}{2}\partial_\mu\phi^+\partial_\mu\phi^- - \frac{1}{2}M^2\phi^0\phi^0 - \beta_1\frac{(\partial_\mu\phi^0)^2}{2} + \\
 & \frac{2M}{2}H + \frac{1}{2}(H^2 + \phi^0\phi^0 + 2\phi^+\phi^-) + \frac{2M^4}{\phi^2}\alpha_h - ig_{\text{ew}}[\partial_\mu Z_\mu^0(W_\mu^+ W_\mu^- - \\
 & W_\mu^+ W_\mu^-) - Z_\mu^0(W_\mu^+\partial_\mu W_\mu^- - W_\mu^-\partial_\mu W_\mu^+) + Z_\mu^0(W_\mu^+\partial_\mu W_\mu^- - \\
 & W_\mu^-\partial_\mu W_\mu^+) - ig_{\text{sw}}[\partial_\mu A_\nu(W_\mu^+ W_\nu^- - W_\nu^+ W_\mu^-) - A_\nu(W_\mu^+\partial_\mu W_\mu^- + \\
 & W_\mu^-\partial_\mu W_\mu^+) + A_\mu(W_\mu^+ W_\mu^- - W_\mu^-\partial_\mu W_\mu^+) - \frac{1}{2}W_\mu^+ W_\mu^+ W_\mu^- + \\
 & \frac{1}{2}W_\mu^- W_\mu^- W_\mu^+ + g^2 c_w^2 (Z_\mu^0 W_\mu^+ Z_\mu^0 W_\mu^- - Z_\mu^0 Z_\mu^0 W_\mu^+ W_\mu^-) + \\
 & g^2 s_w^2 (A_\mu W_\mu^+ A_\nu W_\nu^- - A_\mu A_\nu W_\mu^+ W_\nu^-) + g^2 s_w c_w [A_\mu Z_\nu^0 (W_\mu^+ W_\nu^- - \\
 & W_\nu^+ W_\mu^-) - 2A_\mu Z_\nu^0 W_\mu^+ W_\nu^-] - g\alpha [H^3 + H\phi^0\phi^0 + 2H\phi^+\phi^-] - \\
 & \frac{1}{8}g^2\alpha_h[H^4 + (\phi^0)^4 + 4(\phi^+\phi^-)^2 + 4(\phi^0)^2\phi^+\phi^- + 4H^2\phi^+\phi^- + 2(\phi^0\phi^+)^2] - \\
 & g[MW_\mu^+ W_\mu^- H - \frac{1}{2}ig\frac{M^2}{2}Z_\mu^0 Z_\mu^0 H - \frac{1}{2}ig[W_\mu^+ (H\partial_\mu\phi^- - \phi^-\partial_\mu H) - W_\mu^- (H\partial_\mu\phi^+ - \\
 & \phi^+\partial_\mu H)] + \frac{1}{2}g\frac{1}{c_w}(Z_\mu^0 H\partial_\mu\phi^0 - \phi^0\partial_\mu H) - ig\frac{2M}{c_w}MZ_\mu^0(W_\mu^+\phi^- - W_\mu^-\phi^+) + \\
 & ig_{\text{sw}}MA_\mu(W_\mu^+\phi^- - W_\mu^-\phi^+) - ig\frac{1-2s_w^2}{2c_w}Z_\mu^0(\phi^+\partial_\mu\phi^- - \phi^-\partial_\mu\phi^+) - \\
 & ig_{\text{sw}}A_\mu(\phi^+\partial_\mu\phi^- - \phi^-\partial_\mu\phi^+) - \frac{1}{4}g^2 W_\mu^+ W_\mu^- [H^2 + (\phi^0)^2 + 2\phi^+\phi^-] - \\
 & \frac{1}{4}g^2\frac{2}{c_w^2}Z_\mu^0 Z_\mu^0 [H^2 + (\phi^0)^2 + 2(2s_w^2 - 1)^2\phi^+\phi^-] - \frac{1}{2}g^2\frac{2}{c_w}Z_\mu^0\phi^0(W_\mu^+\phi^- + \\
 & W_\mu^-\phi^+) - \frac{1}{2}ig\frac{2s_w}{c_w}Z_\mu^0 H(W_\mu^+\phi^- - W_\mu^-\phi^+) + \frac{1}{2}g^2 s_w A_\mu\phi^0(W_\mu^+\phi^- + \\
 & W_\mu^-\phi^+) + \frac{1}{2}g^2\frac{1}{c_w}ig_{\text{sw}}A_\mu H(W_\mu^+\phi^- - W_\mu^-\phi^+) - g^2\frac{2s_w}{c_w}(2s_w^2 - 1)Z_\mu^0 A_\mu\phi^0\phi^- - \\
 & g^2 s_w^2 A_\mu A_\nu\phi^+\phi^- - \bar{e}(\gamma^0 + m_e)\gamma^\lambda - \bar{\nu}_\lambda\gamma^0\partial_\lambda - \bar{\nu}_\lambda(\gamma^0 + m_\nu)\gamma^\lambda - \\
 & \bar{d}_\lambda^c(\gamma^0 + m_d^c)\gamma^\lambda + ig_{\text{sw}}A_\mu[-(\bar{e}\gamma^\mu e) + \frac{2}{3}(\bar{\nu}_\lambda^c\gamma^\mu\nu_\lambda^c) - \frac{1}{3}(\bar{d}_\lambda^c\gamma^\mu\bar{u}_\lambda^c)] + \\
 & \frac{2}{3}Z_\mu^0[(\bar{\nu}_\lambda^c\gamma^\mu(1 + \gamma^5)\nu_\lambda^c) + (\bar{e}\gamma^\mu e)(4s_w^2 - 1 - \gamma^5)e^\lambda] + (\bar{\nu}_\lambda^c\gamma^\mu(\frac{2}{3}s_w^2 - \\
 & 1 - \gamma^5)\nu_\lambda^c) + (\bar{d}_\lambda^c\gamma^\mu(1 - \frac{8}{3}s_w^2 - \gamma^5)d_\lambda^c)] + \frac{2}{3}W_\mu^+[(\bar{\nu}_\lambda^c\gamma^\mu(1 + \gamma^5)e^\lambda + \\

 & \partial_\mu\bar{X}^+ X^+) + ig_{\text{ew}}Z_\mu^0(\partial_\mu\bar{X}^+ X^+ - \partial_\mu\bar{X}^- X^-) + ig_{\text{sw}}A_\mu(\partial_\mu\bar{X}^+ X^+ - \\
 & \partial_\mu\bar{X}^- X^-) - \frac{1}{2}igM[\bar{X}^+ X^+ H + \bar{X}^- X^- H + \frac{1}{c_w^2}\bar{X}^0 X^0 H] + \\
 & \frac{1-2s_w^2}{2c_w}igM[\bar{X}^+ X^0\phi^+ - \bar{X}^- X^0\phi^-] + \frac{1}{2c_w}igM[\bar{X}^0 X^-\phi^+ - \bar{X}^0 X^+\phi^-] + \\
 & igM_{\text{sw}}[\bar{X}^0 X^-\phi^+ - \bar{X}^0 X^+\phi^-] + \frac{1}{2}igM[\bar{X}^+ X^+\phi^0 - \bar{X}^- X^-\phi^0]
 \end{aligned}$$

Our task is to derive the long expression and realize that it is nothing else but the short one. **Question:** But why can it be so?

## Principles and symmetries of the SM

*Principles (keep in mind  $SM \subset QFT$ ):*

- ▶ **correspondence**: to QM, QED, Fermi model etc.
- ▶ **minimality**: only observed and/or unavoidable objects
- ▶ **unitarity**:  $0 \leq P \leq 1$  and  $P(\Omega) = 1$
- ▶ **renormalizability**: finite predictions for observables
- ▶ **gauge interactions** between fermions and vector fields
- ▶ **SYMMETRIES**

*Symmetries:*

- ▶ the **Lorentz** symmetry
- ▶ the **CPT** symmetry
- ▶ the **gauge** symmetries:  $SU(3)_C \otimes SU(2)_L \otimes U(1)_Y$
- ▶ **Global** symm. in the Higgs sector (spontaneously broken)
- ▶ unrevealed symmetries (between generations, for anomaly cancellation, conformal, etc.)

## Elements of Quantum Field Theory

Assume that we remember the basics of Quantum Mechanics. But QFT can be constructed on its own. We just have to check the **correspondence**.

**Let us fix the notation:**

$$\hbar = 1 \text{ and } c = 1$$

$\mu = \{0, 1, 2, 3\}$  is a Lorentz index (Greek letters)

$p_\mu$  is a four-momentum,  $\mathbf{p} = (p_1, p_2, p_3)$  is a three-momentum

$pq = p_\mu q_\mu = p_0 q_0 - p_1 q_1 - p_2 q_2 - p_3 q_3$  is a scalar product of two vectors, which is a **relativistic invariant**

$$g_{\mu\nu} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1 \end{pmatrix}, \quad g_{\mu\nu} p_\nu = p_\mu, \quad g_{\mu\mu} = 4$$

$$\frac{\partial}{\partial x_\mu} = \partial_\mu = (\partial_0, -\partial_1, -\partial_2, -\partial_3)$$

$x_0 = t$  is time,  $p_0 = E$  is energy

$p^2 = pp = p_0^2 - \mathbf{p}^2 = E^2 - \mathbf{p}^2 = m^2$  is the on-mass-shell condition (valid for any free particle)

## QFT: scalar field

**Postulate** a scalar quantum field as

$$\varphi(x) = \frac{1}{(2\pi)^{3/2}} \int \frac{d\mathbf{p}}{\sqrt{2p_0}} (e^{-ipx} a^-(\mathbf{p}) + e^{+ipx} a^+(\mathbf{p}))$$

$$[a^-(\mathbf{p}), a^+(\mathbf{p}')] = \delta(\mathbf{p} - \mathbf{p}'), \quad [a^-(\mathbf{p}), a^-(\mathbf{p}')] = [a^+(\mathbf{p}), a^+(\mathbf{p}')] = 0$$

Its Lagrangian reads

$$\mathcal{L} = \frac{1}{2}(\partial_\mu \varphi \partial_\mu \varphi - m^2 \varphi^2)$$

Variation ( $\varphi \rightarrow \varphi + \delta\varphi$ ) of the corresponding action should be equal to zero in accord with the **least action principle**:

$$\delta \int dx \mathcal{L} = \int dx \left( \frac{\partial \mathcal{L}}{\partial \varphi} \delta\varphi + \frac{\partial \mathcal{L}}{\partial (\partial_\mu \varphi)} \delta(\partial_\mu \varphi) \right) = 0$$

**EXERCISE:** Check that this gives the Klein-(Fock)-Gordon equation of motion

$$(m^2 + \partial_\mu^2)\varphi(x) = 0$$

Check that the postulated above field  $\varphi(x)$  satisfies it

## QFT: the Fock space

$a^-(\mathbf{p})$  and  $a^+(\mathbf{p}')$  are **annihilation** and **creation operators**. They act in the **Fock space** which consists of **vacuum**  $|0\rangle$

$$a^-(\mathbf{p})|0\rangle = 0, \quad \langle 0|a^+(\mathbf{p}) = 0, \quad \langle 0|0\rangle = 1$$

and field **excitations**, i.e. states of the form

$$|f\rangle = \int d\mathbf{p} f(\mathbf{p}) a^+(\mathbf{p})|0\rangle, \quad |g\rangle = \int d\mathbf{p} d\mathbf{q} g(\mathbf{p}, \mathbf{q}) a^+(\mathbf{p}) a^+(\mathbf{q})|0\rangle, \dots$$

The most simple excitation  $a^+(\mathbf{p})|0\rangle \equiv |p\rangle$  is used to describe a single on-mass-shell particle with momentum  $\mathbf{p}$ . Then  $a^+(\mathbf{p})a^+(\mathbf{q})|0\rangle$  is a two-particle state etc.

**N.B.** The Fock space is  $\infty$ -dimensional

**EXERCISES:** 1) Find the norm  $\langle p|p\rangle$ , 2) check that the operator  $N = \int d\mathbf{p} a^+(\mathbf{p})a^-(\mathbf{p})$  acts as a particle number operator.

## QFT: charged scalar field

A charged scalar field is defined as

$$\varphi(x) = \frac{1}{(2\pi)^{3/2}} \int \frac{d\mathbf{p}}{\sqrt{2p_0}} (e^{-ipx} a^-(\mathbf{p}) + e^{+ipx} b^+(\mathbf{p}))$$

$$\varphi^*(x) = \frac{1}{(2\pi)^{3/2}} \int \frac{d\mathbf{p}}{\sqrt{2p_0}} (e^{-ipx} b^-(\mathbf{p}) + e^{+ipx} a^+(\mathbf{p}))$$

$$[a^-(\mathbf{p}), a^+(\mathbf{p}')] = [b^-(\mathbf{p}), b^+(\mathbf{p}')] = \delta(\mathbf{p} - \mathbf{p}'), \quad [a^\pm, b^\pm] = 0$$

$a^\pm$  and  $b^\pm$  are creation (and annihilation) operators of particles and anti-particles, respectively (or vice versa)

The Lagrangian reads

$$\mathcal{L} = \partial_\mu \varphi^* \partial_\mu \varphi - m^2 \varphi^* \varphi$$

**N.B.1.**  $\varphi$  and  $\varphi^*$  are related by generalized conjugation

**N.B.2.**  $\varphi$  and  $\varphi^*$  are NOT particle and anti-particle

## QFT: massive vector fields (I)

A massive charged vector field (remind  $W$  boson\*) is defined as

$$U_\mu(x) = \frac{1}{(2\pi)^{3/2}} \int \frac{d\mathbf{p}}{\sqrt{2p_0}} \sum_{n=1,2,3} e_\mu^n(\mathbf{p}) (e^{-ipx} a_n^-(\mathbf{p}) + e^{+ipx} b_n^+(\mathbf{p}))$$

$$U_\mu^*(x) = \frac{1}{(2\pi)^{3/2}} \int \frac{d\mathbf{p}}{\sqrt{2p_0}} \sum_{n=1,2,3} e_\mu^n(\mathbf{p}) (e^{-ipx} b_n^-(\mathbf{p}) + e^{+ipx} a_n^+(\mathbf{p}))$$

$$[a_n^-(\mathbf{p}), a_l^+(\mathbf{p}')] = [b_n^-(\mathbf{p}), b_l^+(\mathbf{p}')] = \delta_{nl} \delta(\mathbf{p} - \mathbf{p}'), \quad [a^\pm, b^\pm] = 0$$

$e_\mu^n(\mathbf{p})$  are **polarization vectors**

$$e_\mu^n(\mathbf{p}) e_\mu^l(\mathbf{p}) = -\delta_{nl}, \quad p_\mu e_\mu^n(\mathbf{p}) = 0$$

**EXERCISE:** Using the above orthogonality conditions, show that

$$\sum_{n=1,2,3} e_\mu^n(\mathbf{p}) e_\nu^n(\mathbf{p}) = -\left( g_{\mu\nu} - \frac{p_\mu p_\nu}{m^2} \right)$$

## QFT: massive vector fields (II)

For a massive charged vector field

$$\mathcal{L} = -\frac{1}{2}(\partial_\mu U_\nu^* - \partial_\nu U_\mu^*)(\partial_\mu U_\nu - \partial_\nu U_\mu) + m^2 U_\mu^* U_\mu$$

The corresponding Euler-Lagrange equation reads

$$\partial_\nu(\partial_\mu U_\nu - \partial_\nu U_\mu) + m^2 U_\mu = 0$$

**EXERCISE:** Using the above equation, show that  $\partial_\nu U_\nu = 0$ ,  
i.e. the **Lorentz condition**

**N.B.** The Lorentz condition removes one of four independent field components

**QUESTION:** How can it be that the signs before the mass terms in the scalar and vector field Lagrangians are different?

## QFT: massless vector fields

A massless neutral vector field (photon) is defined as

$$A_\mu(x) = \frac{1}{(2\pi)^{3/2}} \int \frac{d\mathbf{p}}{\sqrt{2p_0}} e_\mu^\lambda(\mathbf{p}) (e^{-ipx} a_\lambda^-(\mathbf{p}) + e^{+ipx} a_\lambda^+(\mathbf{p}))$$

$$[a_\lambda^-(\mathbf{p}), a_\nu^+(\mathbf{p}')] = -g_{\lambda\nu} \delta(\mathbf{p} - \mathbf{p}')$$

$$e_\mu^\lambda(\mathbf{p}) e_\nu^\lambda(\mathbf{p}) = g_{\mu\nu}, \quad e_\mu^\lambda(\mathbf{p}) e_\mu^\nu(\mathbf{p}) = g_{\lambda\nu}$$

**N.B.** Formally this field has four polarizations, but only two of them correspond to physical degrees of freedom

The corresponding Lagrangian reads

$$\mathcal{L} = -\frac{1}{4} F_{\mu\nu} F_{\mu\nu}, \quad F_{\mu\nu} \equiv \partial_\mu A_\nu - \partial_\nu A_\mu$$

## QFT: spinor fields (I)

A Dirac fermion field is defined as

$$\Psi(x) = \frac{1}{(2\pi)^{3/2}} \int \frac{d\mathbf{p}}{\sqrt{2p_0}} \sum_{r=1,2} (e^{-ipx} a_r^-(\mathbf{p}) u_r(\mathbf{p}) + e^{+ipx} b_r^+(\mathbf{p}) v_r(\mathbf{p}))$$

$$\bar{\Psi}(x) = \frac{1}{(2\pi)^{3/2}} \int \frac{d\mathbf{p}}{\sqrt{2p_0}} \sum_{r=1,2} (e^{-ipx} b_r^-(\mathbf{p}) \bar{v}_r(\mathbf{p}) + e^{+ipx} a_r^+(\mathbf{p}) \bar{u}_r(\mathbf{p}))$$

$$[a_r^-(\mathbf{p}), a_s^+(\mathbf{p}')]_+ = [b_r^-(\mathbf{p}), b_s^+(\mathbf{p}')]_+ = \delta_{rs} \delta(\mathbf{p} - \mathbf{p}')$$

$$[a_r^+(\mathbf{p}), a_s^+(\mathbf{p}')]_+ = [a_r^-(\mathbf{p}), b_s^+(\mathbf{p}')]_+ = \dots = 0$$

**EXERCISE:** Show that  $a_r^+(\mathbf{p}) a_r^+(\mathbf{p}) = 0$ , i.e. the **Pauli principle**

**EXERCISE:** Define a Majorana fermion field

## QFT: spinor fields (II)

$u_r$ ,  $u_r$ ,  $\bar{u}_r$ , and  $\bar{v}_r$  are four-component spinors, so  $\Psi(x) \equiv \{\Psi_\alpha(x)\}$  is a four-vector column,  $\alpha = \{1, 2, 3, 4\}$  and  $\bar{\Psi}(x)$  is a four-vector row

$$\bar{u}u = \sum_{\alpha=1}^4 \bar{u}_\alpha u_\alpha = \sum_{\alpha=1}^4 u_\alpha \bar{u}_\alpha = \text{Tr}(u\bar{u})$$

Spinors are solutions of the (Dirac) equations:

$$\begin{aligned}(\hat{p} - m)u_r(\mathbf{p}) &= 0, & \bar{u}_r(\mathbf{p})(\hat{p} - m) &= 0 \\(\hat{p} + m)v_r(\mathbf{p}) &= 0, & \bar{v}_r(\mathbf{p})(\hat{p} + m) &= 0 \\ \hat{p} \equiv p_\mu \gamma_\mu &= p_0 \gamma_0 - p_1 \gamma_1 - p_2 \gamma_2 - p_3 \gamma_3, & m &\equiv m \cdot \mathbf{1}\end{aligned}$$

with normalization conditions

$$\bar{u}_r(\mathbf{p})u_s(\mathbf{p}) = -\bar{v}_r(\mathbf{p})v_s(\mathbf{p}) = 2m \delta_{rs}$$

## QFT: Dirac's gamma matrixes

The gamma matrixes (should) satisfy the commutation condition

$$[\gamma_\mu, \gamma_\nu]_+ = 2g_{\mu\nu}\mathbf{1} \quad \Rightarrow \quad \gamma_0^2 = \mathbf{1}, \quad \gamma_1^2 = \gamma_2^2 = \gamma_3^2 = -\mathbf{1}$$

and the condition of Hermitian conjugation

$$\gamma_\mu^\dagger = \gamma_0 \gamma_\mu \gamma_0$$

The latter leads to the rule of the **Dirac conjugation**:

$$\bar{\Psi} = \Psi^\dagger \gamma_0, \quad \bar{u} = u^\dagger \gamma_0, \quad \bar{v} = v^\dagger \gamma_0$$

**N.B.** Explicit expressions for gamma matrixes are not unique, but they are not necessary for construction of observables.

**Why?**

**EXERCISE:** Show that the Dirac conjugation rule is consistent with the set of Dirac equations given on the previous slide

## QFT: Left and Right spinors

One can show that the Dirac equations have two independent solutions  $u_{1,2}$  which correspond to different polarization states. But it is useful to consider also another choice. We introduce

$$\gamma_5 \equiv i\gamma_0\gamma_1\gamma_2\gamma_3 \Rightarrow [\gamma_\mu, \gamma_5]_+ = 0, \quad \gamma_5^2 = \mathbf{1}, \quad \gamma_5^\dagger = \gamma_5$$

By definition **left** and **right** spinors are

$$\psi_L \equiv P_L \psi, \quad \psi_R \equiv P_R \psi, \quad P_{L,R} \equiv \frac{\mathbf{1} \mp \gamma_5}{2}, \quad \psi = \psi_L + \psi_R$$

The Dirac conjugation gives  $\bar{\psi}_L \equiv \bar{\psi} \frac{1+\gamma_5}{2}$ ,  $\bar{\psi}_R \equiv \bar{\psi} \frac{1-\gamma_5}{2}$

**N.B.1.** In Weyl's representation of  $\gamma$  matrixes  $\psi_L = \frac{1+\gamma_5}{2}\psi$ .

**N.B.2.** Definition of left and right spinors as polarization states  $\mathbf{s} \downarrow \uparrow \mathbf{p}$  and  $\mathbf{s} \uparrow \uparrow \mathbf{p}$  is **wrong**. It is just an approximation working in ultra-relativistic kinematics  $|\mathbf{p}| \gg m$

**EXERCISE:** Prove the  $P_{L,R}$  is a basis of orthogonal **projection operators** is the space of spinors:

$$P_L + P_R = \mathbf{1}, \quad P_L^2 = P_L, \quad P_R^2 = P_R, \quad P_R P_L = P_L P_R = 0$$

## QFT: Lagrangian for spinor fields

Remind some properties of gamma matrixes

$$\begin{aligned}\text{Tr}\gamma_\mu &= \text{Tr}\gamma_5 = 0, & \text{Tr}\gamma_\mu\gamma_\nu &= 4g_{\mu\nu}, & \text{Tr}\gamma_5\gamma_\mu\gamma_\nu &= 0, \\ \text{Tr}\gamma_\mu\gamma_\nu\gamma_\alpha\gamma_\beta &= 4(g_{\mu\nu}g_{\alpha\beta} - g_{\mu\alpha}g_{\nu\beta} + g_{\mu\beta}g_{\nu\alpha}), \\ \text{Tr}\gamma_5\gamma_\mu\gamma_\nu\gamma_\alpha\gamma_\beta &= -4i\varepsilon_{\mu\nu\alpha\beta}\end{aligned}$$

The equations for  $u$  and  $v$  are chosen so that we get the conventional **Dirac equations**

$$(i\gamma_\mu\partial_\mu - m)\Psi(x) = 0, \quad i\partial_\mu\bar{\Psi}(x)\gamma_\mu + m\bar{\Psi}(x) = 0$$

These equations follow also from the Lagrangian

$$\mathcal{L} = \frac{i}{2} \left[ \bar{\Psi}\gamma_\mu(\partial_\mu\Psi) - (\partial_\mu\bar{\Psi})\gamma_\mu\Psi \right] - m\bar{\Psi}\Psi \equiv i\bar{\Psi}\gamma_\mu\partial_\mu\Psi - m\bar{\Psi}\Psi$$

**N.B.** QFT Lagrangians (Hamiltonians) should be Hermitian:  $\mathcal{L}^\dagger = \mathcal{L}$ . **QUESTION:** Why?

**EXERCISE:** Find two bugs on the CERN mugs

## The SM Lagrangian (on a T-shirt)

$$\begin{aligned}\mathcal{L} = & -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \\ & + i\bar{\psi} \not{D} \psi + \text{h.c.} \\ & + \chi_i Y_{ij} \chi_j \phi + \text{h.c.} \\ & + |D_\mu \phi|^2 - V(\phi)\end{aligned}$$

## QFT: Evolution of states

Up to now we considered only **free** non-interacting fields. Studies of transitions between free states is the main task of QFT. **Collective, nonperturbative effects, bound states etc.** are also of interest of course.

Let us postulate the transition **amplitude**  $\mathcal{M}$  of a physical process:

$$\mathcal{M} \equiv \langle out | S | in \rangle, \quad S \equiv T \exp \left( i \int dx \mathcal{L}_I(\varphi(x)) \right)$$

The initial and final states are

$$|in\rangle = a^+(\mathbf{p}_1) \dots a^+(\mathbf{p}_s) |0\rangle, \quad |out\rangle = a^+(\mathbf{p}'_1) \dots a^+(\mathbf{p}'_r) |0\rangle$$

The differential probability to evolve from  $|in\rangle$  to  $|out\rangle$  is

$$dw = (2\pi)^4 \delta(\sum p'_i) \frac{n_1 \dots n_s}{2E_1 \dots E_s} |\mathcal{M}|^2 \prod_{j=1}^r \frac{d\mathbf{p}'_j}{(2\pi)^3 2E'_j}$$

here  $n_i$  is the particle number density of  $i^{\text{th}}$  particle beam

## QFT: Interaction Lagrangians

Nontrivial transitions happen due to interactions of fields. QFT prefers\* dealing with **local** interactions  $\Rightarrow \mathcal{L}_I = \mathcal{L}_I(\varphi(x))$   
Examples of interaction Lagrangians:

$$g\varphi^3(x), \quad h\varphi^4(x), \quad y\varphi(x)\bar{\Psi}(x)\Psi(x)$$
$$e\bar{\Psi}(x)\gamma_\mu\Psi(x)A_\mu(x), \quad G\bar{\Psi}_1(x)\gamma_\mu\Psi_1(x)\cdot\bar{\Psi}_2(x)\gamma_\mu\Psi_2(x)$$

**IMPORTANT:** Always keep in mind the **dimension** of your objects! The reference unit is the dimension of energy (mass):

$$[E] = [m] = 1 \quad \Rightarrow \quad [\rho] = 1, \quad [x] = -1$$

An action should be dimensionless  $\left[ \int dx \mathcal{L}(x) \right] = 0 \Rightarrow [\mathcal{L}] = 4$

**EXERCISE:** Show that  $[\varphi] = [A_\mu] = 1$  and  $[\Psi] = 3/2$ . Find the dimensions of the coupling constants  $g$ ,  $h$ ,  $y$ ,  $e$ , and  $G$  in the examples of  $\mathcal{L}_I$  above

## QFT: Time ordering

By definition

$$T A_1(x_1) \dots A_n(x_n) = (-1)^k A_{i_1}(x_{i_1}) \dots A_{i_n}(x_{i_n}) \text{ with } x_{i_1}^0 > \dots > x_{i_n}^0$$

where  $k$  is the number of fermion field permutations

**N.B.** Objects like  $A_1(x)A_2(y)$  with  $x = y$  are not well defined, they lead to divergences

**Perturbative expansion** of  $S$  matrix exponent leads to terms like

$$\frac{i^n g^n}{n!} \langle 0 | a^-(\mathbf{p}'_1) \dots a^-(\mathbf{p}'_r) \int dx_1 \dots dx_n T \varphi^3(x_1) \dots \varphi^3(x_n) a^+(\mathbf{p}_1) \dots a^+(\mathbf{p}_s) | 0 \rangle$$

Remind that fields  $\varphi$  also contain creation and annihilation operators.

By permutation of operators  $a^-(\mathbf{p})a^+(\mathbf{p}') = a^+(\mathbf{p}')a^-(\mathbf{p}) + \delta(\mathbf{p} - \mathbf{p}')$  we move  $a^-$  to the right and  $a^+$  to the left. At the end we get either 0 because  $a^-|0\rangle = 0$  or some terms proportional to  $\langle 0|0\rangle = 1$

**EXERCISE:** Show that  $[a^-(\mathbf{p}), \varphi(x)] = \frac{e^{ipx}}{(2\pi)^{3/2} \sqrt{2p_0}}$  and

$$[a_r^-(\mathbf{p}), \bar{\Psi}(x)]_+ = \frac{e^{ipx} \bar{u}_r(\mathbf{p})}{(2\pi)^{3/2} \sqrt{2p_0}}$$

## QFT: the Green functions

By definition the **causal Green function** is given by

$$\langle 0|T\varphi(x)\varphi(y)|0\rangle \equiv -iD^c(x-y)$$

It is a building block for construction of amplitudes

One can show (see textbooks) that

$$(\partial^2 + m^2)D^c(x) = \delta(x)$$

so that  $D^c$  is the Green function of the Klein-Gordon operator,

$$D^c(x) = \frac{-1}{(2\pi)^4} \int \frac{dp e^{-ipx}}{p^2 - m^2 + i0}$$

For other fields we have

$$\langle 0|T \psi(x)\bar{\psi}(y)|0\rangle = \frac{i}{(2\pi)^4} \int \frac{dp e^{-ip(x-y)}(\hat{p} + m)}{p^2 - m^2 + i0}$$

$$\langle 0|T U_\mu(x)U_\nu^*(y)|0\rangle = \frac{-i}{(2\pi)^4} \int \frac{dp e^{-ip(x-y)}(g_{\mu\nu} - p_\mu p_\nu/m^2)}{p^2 - m^2 + i0}$$

$$\langle 0|T A_\mu(x)A_\nu(y)|0\rangle = \frac{-i}{(2\pi)^4} \int \frac{dp e^{-ip(x-y)}g_{\mu\nu}}{p^2 + i0}$$

## QFT: the Wick theorem

The Wick theorem states that for any combinations of fields

$$T A_1 \dots A_n \equiv \sum (-1)^k \langle 0 | T A_{i_1} A_{i_2} | 0 \rangle \dots \langle 0 | T A_{i_{m-1}} A_{i_m} | 0 \rangle : A_{i_{m+1}} \dots A_{i_n} :$$

The sum is taken over all possible ways to pair the fields

The **normal ordering** operation acts as

$$: a_1^- a_2^+ a_3^- a_4^- a_5^+ a_6^- a_7^+ : = (-1)^k a_2^+ a_5^+ a_7^+ a_1^- a_3^- a_4^- a_6^-$$

Using the Wick theorem we construct the **Feynman rules** for simple  $g\phi^3$  and  $h\phi^4$  interactions. But for the case of gauge interactions we need something more...

## QFT: the Noether theorems (I)

There are two major types of symmetries in the SM: **global** and **local** ones

The **1st Noether theorem**:

*If the action is invariant with respect to the global Lie group  $G_r$  with  $r$  parameters, then there are  $r$  linearly independent combinations of Lagrange derivatives which become complete divergences; and vice versa.*

If the field satisfies the Euler-Lagrange equations, then  $\text{div}J = \nabla J = 0$ , i.e. the **Noether currents** are conserved.

Integration of those divergences over 3-dim space (with certain boundary conditions) leads to  $r$  **conserved charges**.

**EXERCISE:** Remind examples from QED and Poincaré global symmetries

## QFT: the Noether theorems (II)

Much more important for us is the **2nd Noether theorem**:

*If the action is invariant with respect to the infinite-dimensional  $r$ -parametric group  $G_{\infty,r}$  with derivatives up to the  $k^{\text{th}}$  order, then there are  $r$  independent relations between Lagrange derivatives and derivatives of them up to the  $k^{\text{th}}$  order; and vice versa.*

**N.B.** The 2nd Noether theorem provides  $r$  conditions on the fields which are additional to the standard Euler-Lagrange equations. These conditions should be used to exclude **double counting** of **physically equivalent** field configurations.

Examples of **infinite-dimensional** groups are local gauge transformations (see below) and the general coordinate transformations in General Relativity

## QFT: Gauge symmetry (I)

The free Lagrangians for electrons and photons

$$\mathcal{L}_0(\Psi) = i\bar{\Psi}\gamma_\mu\partial_\mu\Psi - m\bar{\Psi}\Psi, \quad \mathcal{L}_0(A) = -\frac{1}{4}F_{\mu\nu}F_{\mu\nu}$$

are invariant with respect to the **global**  $U(1)$  transformations

$$\Psi(x) \rightarrow \exp(ie\theta)\Psi(x), \quad \bar{\Psi}(x) \rightarrow \exp(-ie\theta)\bar{\Psi}(x), \quad A_\mu(x) \rightarrow A_\mu(x)$$

One can note that  $F_{\mu\nu}$  is invariant also with respect to **local** transformations  $A_\mu(x) \rightarrow A_\mu(x) + \partial_\mu\omega(x)$ . For fermions the corresponding transformations are

$$\Psi(x) \rightarrow \exp(ie\omega(x))\Psi(x), \quad \bar{\Psi}(x) \rightarrow \exp(-ie\omega(x))\bar{\Psi}(x)$$

How to make the fermion Lagrangian being also invariant?

The answer is to introduce the **covariant derivative**:

$$\partial_\mu \rightarrow D_\mu, \quad D_\mu\Psi \equiv (\partial_\mu - ieA_\mu)\Psi, \quad D_\mu\bar{\Psi} \equiv (\partial_\mu + ieA_\mu)\bar{\Psi}$$

Then we get the QED Lagrangian:

$$\begin{aligned}\mathcal{L}_{\text{QED}} &= -\frac{1}{4}F_{\mu\nu}F_{\mu\nu} + i\bar{\Psi}\gamma_\mu D_\mu\Psi - m\bar{\Psi}\Psi \\ &= -\frac{1}{4}F_{\mu\nu}F_{\mu\nu} + i\bar{\Psi}\gamma_\mu\partial_\mu\Psi - m\bar{\Psi}\Psi + e\bar{\Psi}\gamma_\mu\Psi A_\mu\end{aligned}$$

## QFT: Gauge symmetry (II)

**EXERCISES:** 1) Check the covariance:  $D_\mu \Psi \rightarrow e^{ie\omega(x)}(D_\mu \Psi)$ ,  
2) construct the Lagrangian of scalar QED

Let's look at the photon free Lagrangian

$$\mathcal{L}_0(A) = -\frac{1}{4}(\partial_\mu A_\nu - \partial_\nu A_\mu)^2 = -\frac{1}{2}A_\nu K_{\mu\nu} A_\nu,$$
$$K_{\mu\nu} = g_{\mu\nu} \partial^2 - \partial_\mu \partial_\nu \quad \Rightarrow \quad K_{\mu\nu}(p) = p_\mu p_\nu - g_{\mu\nu} p^2$$

Operator  $K_{\mu\nu}(p)$  has zero modes (since  $p_\mu K_{\mu\nu} = 0$ ), so it is not invertible. Definition of the photon propagator within the **functional integral formalism** becomes impossible. The reason is the unresolved symmetry.

The solution is to introduce a **gauge fixing term** into the Lagrangian:

$$\mathcal{L}_0(A) = -\frac{1}{4}F_{\mu\nu}F_{\mu\nu} - \frac{1}{2\xi}(\partial_\mu A_\mu)^2 \quad \Rightarrow$$
$$\langle 0|T A_\mu(x)A_\nu(y)|0\rangle = \frac{-i}{(2\pi)^4} \int dp e^{-ip(x-y)} \frac{g_{\mu\nu} + (\xi - 1)p_\mu p_\nu / p^2}{p^2 + i0}$$

**N.B.** Physical (observable) quantities **do not** depend on the value of  $\xi$

## QFT: Non-abelian Gauge symmetry

Transformations for a **non-abelian** case read

$$\Psi_i \rightarrow e^{ig\omega^a t_{ij}^a} \Psi_j, \quad [t^a, t^b] = if^{abc} t^c$$

$$B_\mu^a \rightarrow B_\mu^a + \partial_\mu \omega^a + gf^{abc} B_\mu^b \omega^c, \quad F_{\mu\nu} \equiv \partial_\mu B_\nu^a - \partial_\nu B_\mu^a + gf^{abc} B_\mu^b B_\nu^c$$

where  $t^a$  are the group generators,  $f^{abc}$  are the structure constants

Introduce the covariant derivative

$$\partial_\mu \Psi \rightarrow D_\mu \Psi \equiv (\partial_\mu - igB_\mu^a t^a) \Psi$$

and we get

$$\mathcal{L}(\Psi, B) = i\bar{\Psi}\gamma_\mu D_\mu \Psi + \mathcal{L}(B),$$

$$\mathcal{L}(B) = -\frac{1}{4} F_{\mu\nu}^a F_{\mu\nu}^a - \frac{1}{2\xi} (\partial_\mu B_\mu^a)^2 = -\frac{1}{4} (\partial_\mu B_\nu^a - \partial_\nu B_\mu^a)^2$$

$$-\frac{1}{2\xi} (\partial_\mu B_\mu^a)^2 - \frac{g}{2} f^{abc} (\partial_\mu B_\nu^a - \partial_\nu B_\mu^a) B_\mu^b B_\nu^c - \frac{g^2}{4} f^{abc} f^{ade} B_\mu^b B_\nu^c B_\mu^d B_\nu^e$$

**N.B.1.**  $\mathcal{L}(B)$  contains self-interactions. **N.B.2.**  $m_B \equiv 0$ , why?

**N.B.3.** Non-abelian charge  $g$  is **universal**

## QFT: Faddeev-Popov ghosts

Exclusion of double-counting due to the physical equivalence of the field configurations related to each other by non-abelian gauge transformations is nontrivial. Functional integration over those identical configurations (or application of the BRST method) leads to the appearance of the so-called **Faddeev-Popov ghosts**:

$$\mathcal{L}(\Psi, B) \rightarrow \mathcal{L}(\Psi, B) + \mathcal{L}_{gh}$$

$$\mathcal{L}_{gh} = -\partial_\mu \bar{c}^a \partial_\mu c^a + g f^{acb} \bar{c}^a B_\mu^c \partial_\mu c^a = -\partial_\mu \bar{c}^a \partial_\mu c^a - g f^{acb} \partial_\mu \bar{c}^a B_\mu^c c^a$$

where  $c$  and  $\bar{c}$  are ghost fields, they are fermions with a boson-like kinetic term.

**IMPORTANT:** Ghosts are **fictitious** particles. In the Feynman rules they (should) appear only as virtual states in propagators

**N.B.** Ghosts in QED are non-interacting since  $f^{abc} = 0$  there

## QFT: Regularization of UV divergences

Higher-order terms in perturbative series contain loop integrals, e.g.

$$I_2 \equiv \int \frac{d^4 p}{(p^2 + i0)((k-p)^2 + i0)} \sim \int_0^\infty \frac{|p|^3 d|p|}{|p|^4} \sim \ln \infty$$

Introduction of a cut-off  $M$  leads to a finite, i.e. **regularized** value of the integral:

$$I_2^{\text{cut-off}} = i\pi^2 \left( \ln \frac{M^2}{k^2} + 1 \right) + \mathcal{O}\left(\frac{k^2}{M^2}\right) = i\pi^2 \left( \ln \frac{M^2}{\mu^2} - \ln \frac{k^2}{\mu^2} + 1 \right) + \mathcal{O}\left(\frac{k^2}{M^2}\right)$$

Another possibility is the **dimensional regularization** where  
 $\text{dim} = 4 \rightarrow \text{dim} = 4 - 2\varepsilon$

$$I_2^{\text{dim.reg.}} = \mu^{2\varepsilon} \int \frac{d^{4-2\varepsilon} p}{(p^2 + i0)((k-p)^2 + i0)} = i\pi^2 \left( \frac{1}{\varepsilon} - \ln \frac{k^2}{\mu^2} + 2 \right) + \mathcal{O}(\varepsilon)$$

**N.B.** The origin of UV divergences is the **locality** of interactions

## QFT: Renormalization

Let's consider a three-point (vertex) function in the  $g\phi^3$  model

$$G = \int dx dy dz \varphi(x)\varphi(y)\varphi(z)F(x, y, z,)$$

$$F^{\text{dim.reg.}} = \frac{A}{\varepsilon}\delta(y-x)\delta(z-x) + \dots \Rightarrow G = \frac{A}{\varepsilon} \int dx \varphi^3(x) + \dots$$

**IMPORTANT:** Divergent terms are **local**.

*A QFT model is called **renormalizable** if all UV-divergent terms are of the type of the ones existing in the (semi)classical Lagrangian. Otherwise the model is called **nonrenormalizable**.*

**EXAMPLES:**

a) renormalizable models: QED, QCD, **SM** [t Hooft & Veltman],  
 $h\varphi^4$ ,  $g\varphi^3$

b) nonrenormalizable models:  $G(\bar{\Psi}\gamma_\mu\Psi)^2$ , General Relativity

**N.B.** Models with dimensionful ( $[G] < 0$ ) coupling constants are nonrenormalizable

## QFT: Subtractions and counter terms

In renormalizable models all UV divergences can be **subtracted** from amplitudes and shifted into **counter terms** in  $\mathcal{L}$ . Each\* term in  $\mathcal{L}$  gets a **renormalization** constant:

$$\mathcal{L} = \frac{Z_2}{2}(\partial\varphi)^2 - \frac{Z_m m^2}{2}\varphi^2 + Z_4 h\varphi^4 = \frac{1}{2}(\partial\varphi_B)^2 - \frac{m_B^2}{2}\varphi^2 + h_B\varphi^4$$

where  $\varphi_B = \sqrt{Z_2}\varphi$ ,  $m_B^2 = m^2 Z_M Z_2^{-1}$ ,  $h_B = h Z_4 Z_2^{-2}$  are **bare** field, mass, and charge,

$$Z_i(h, \varepsilon) = 1 + \frac{Ah}{\varepsilon} + \frac{Bh^2}{\varepsilon^2} + \frac{Ch^2}{\varepsilon} + \mathcal{O}(h^3)$$

Renormalization constants are chosen in such a way that divergences in amplitudes are **cancelled out** with divergences in  $Z_i$ . That happens **order by order**.

**N.B.** R. Feynman: *"I think that the renormalization theory is simply a way to sweep the difficulties of the divergences of electrodynamics under the rug."*

## QFT: Renormalization group

Physical results **should not** depend on the auxiliary scale  $\mu$ :

$$F(k, g, m) \xrightarrow{\infty} F_{\text{reg}}(k, M, g, m) \xrightarrow{M \rightarrow \infty} F_{\text{ren}}(k, \mu, g, m) \xrightarrow{RG} F_{\text{phys}}(k, \Lambda, m)$$

where  $\Lambda$  is some dimensionful scale

Charge (and mass) become **running**, i.e. energy-dependent:

$$g \rightarrow g\left(g, \frac{\mu'}{\mu}\right), \quad \beta(g) \equiv \left. \frac{dg}{d \ln \mu} \right|_{g_B = \text{const}}$$

**N.B.1.** Renormalization scale unavoidably appears in any scheme

**N.B.2.** Scheme and scale dependencies are reduced after including higher orders of the perturbation theory

## QFT: Dimensional Transmutation

Resummation of multi-leg Feynman diagrams (with loops) in a QFT model provides the so called **effective potential**  $V(\phi)$

S. Coleman and E. Weinberg (PRD'1973) have shown that starting from a mass less (conformal invariant) semi-classical Lagrangian (e.g. for a scalar field) one can get an effective potential which is **infra-red** divergent:

$$V_{\text{classical}}(\phi) = \frac{\lambda}{4!} \phi^4 \rightarrow \left[ \text{resummation} + \text{renormalization} \right] \rightarrow$$
$$V_{\text{quantum}}(\phi) = \frac{\lambda}{4!} \phi^4 + \frac{\lambda^2 \phi^4}{256\pi^2} \left( \ln \frac{\phi^2}{\Lambda^2} - \frac{25}{6} \right)$$

The stability condition  $V'(\langle\phi\rangle) = 0$  provides a relation between  $\langle\phi\rangle \neq 0$ ,  $M$  and  $\lambda$ . The dimensionless coupling constant is **traded** for a dimensionful scale  $\Lambda$

**Conformal anomaly** generates non-zero condensate and mass

**N.B.** Relation  $\alpha_{\text{QCD}}(Q^2) = \frac{4\pi}{\beta_0 \ln(Q^2/\Lambda_{\text{QCD}})}$  is another example of **dimensional transmutation**
