

Soft QCD in exclusive reactions at high energies

Piotr Lebiedowicz

Institute of Nuclear Physics Polish Academy of Sciences, Kraków, Poland

in collaboration with

Otto Nachtmann (Univ. Heidelberg) and Antoni Szczurek (IFJ PAN Kraków)

*WE-Heraeus Physics School
QCD - Old Challenges and New Opportunities
Bad Honnef, Sept 24-30, 2017*

Plan

1) $pp \rightarrow pp \pi^+\pi^-$ reaction

- diffractive mechanism – dipion continuum, scalar and tensor resonances
- photoproduction ρ^0 and non-resonant (Drell-Söding) mechanism

2) $pp \rightarrow pp \pi^+\pi^-\pi^+\pi^-$ via the intermediate $\sigma\sigma$ and pp states

- P. L., O. Nachtmann, A. Szczurek, *Exclusive central diffractive production of scalar and pseudoscalar mesons; tensorial vs. vectorial pomeron*, *Annals Phys.* **344** (2014) 301
- P. L., O. Nachtmann, A. Szczurek, *ρ^0 and Drell-Söding contributions to central exclusive production of $\pi^+\pi^-$ pairs in proton-proton collisions at high energies*, *Phys. Rev.* **D91** (2015) 07402300
- P. L., O. Nachtmann, A. Szczurek, *Central exclusive diffractive production of the $\pi^+\pi^-$ continuum, scalar and tensor resonances in pp and $p\bar{p}$ scattering within the tensor Pomeron approach*, *Phys. Rev.* **D93** (2016) 054015
- P. L., O. Nachtmann, A. Szczurek, *Exclusive diffractive production of $\pi^+\pi^-\pi^+\pi^-$ via the intermediate $\sigma\sigma$ and pp states in proton-proton collisions within tensor Pomeron approach*, *Phys. Rev.* **D94** (2016) 034017
- P. L., O. Nachtmann, A. Szczurek, *Central production of ρ^0 in pp collisions with single proton diffractive dissociation at the LHC*, *Phys. Rev.* **D95** (2017) 034036

The nature of soft pomeron

High-energy pp elastic scattering is dominated by pomeron exchange.

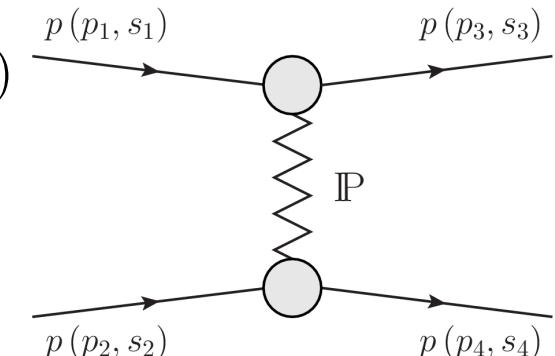

The pomeron has vacuum internal quantum numbers: $Q = Q_c = I = 0, C = +1$.

Spin structure ?

C. Ewerz, M. Maniatis, O. Nachtmann, *A Model for Soft High-Energy Scattering: Tensor Pomeron and Vector Odderon*, Annals Phys. 342 (2014) 31

The soft pomeron is described as the effective exchange of a symmetric rank-two tensor object, the tensor pomeron.

$$\begin{aligned} <2s_3, 2s_4 | \mathcal{T} | 2s_1, 2s_2> &= (-i)\bar{u}(p_3, s_3)i\Gamma_{\mu\nu}^{(\mathbb{P}_{Tpp})}(p_3, p_1)u(p_1, s_1) \\ &\times i\Delta^{(\mathbb{P}_T)\mu\nu, \kappa\lambda}(s, t) \\ &\times \bar{u}(p_4, s_4)i\Gamma_{\mu\nu}^{(\mathbb{P}_{Tpp})}(p_4, p_2)u(p_2, s_2) \end{aligned}$$

$$i\Delta_{\mu\nu, \kappa\lambda}^{(\mathbb{P}_T)}(s, t) = \frac{1}{4s} \left(g_{\mu\kappa}g_{\nu\lambda} + g_{\mu\lambda}g_{\nu\kappa} - \frac{1}{2}g_{\mu\nu}g_{\kappa\lambda} \right) (-is\alpha'_{\mathbb{P}})^{\alpha_{\mathbb{P}}(t)-1}$$

$$i\Gamma_{\mu\nu}^{(\mathbb{P}_{Tpp})}(p', p) = -i3\beta_{\mathbb{P}NN}F_1((p' - p)^2) \left\{ \frac{1}{2}[\gamma_\mu(p' + p)_\nu + \gamma_\nu(p' + p)_\mu] - \frac{1}{4}g_{\mu\nu}(p' + p) \right\}$$

$$3 \times \beta_{\mathbb{P}NN} = 3 \times 1.87 \text{ GeV}^{-1}$$

$$F_1(t) = \frac{4m_p^2 - 2.79t}{(4m_p^2 - t)(1 - t/m_D^2)^2}, \quad m_D^2 = 0.71 \text{ GeV}^2$$

$$\alpha_{\mathbb{P}}(t) = \alpha_{\mathbb{P}}(0) + \alpha'_{\mathbb{P}}t$$

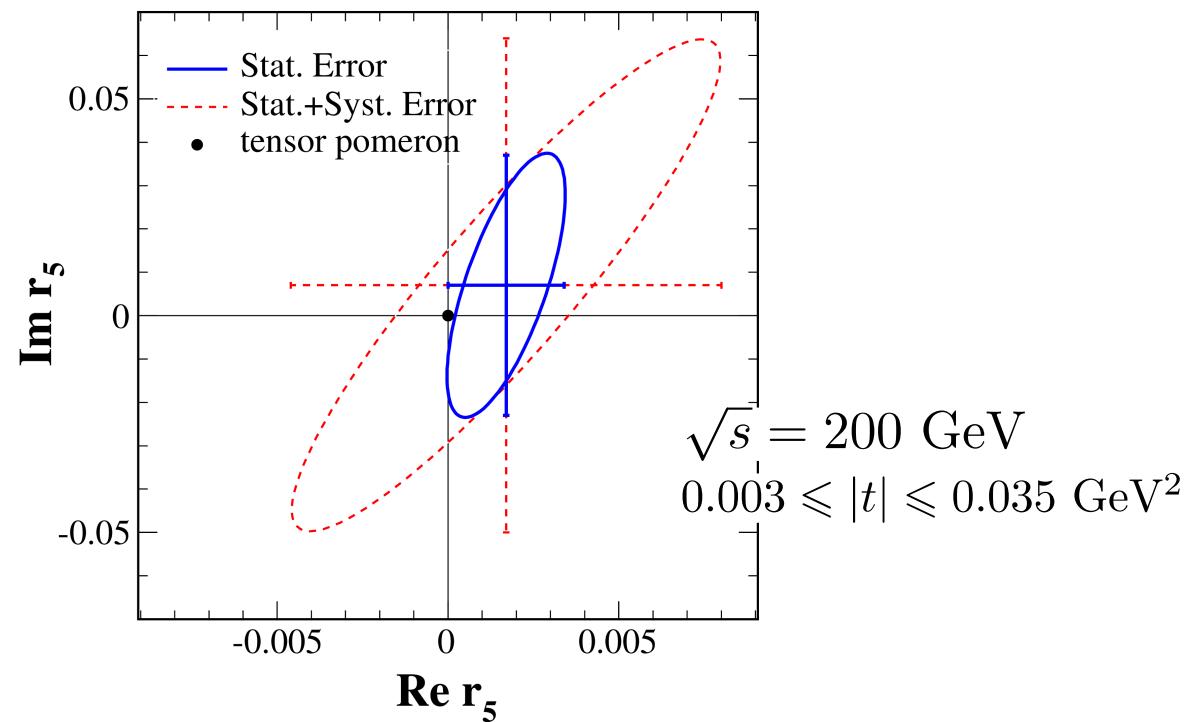

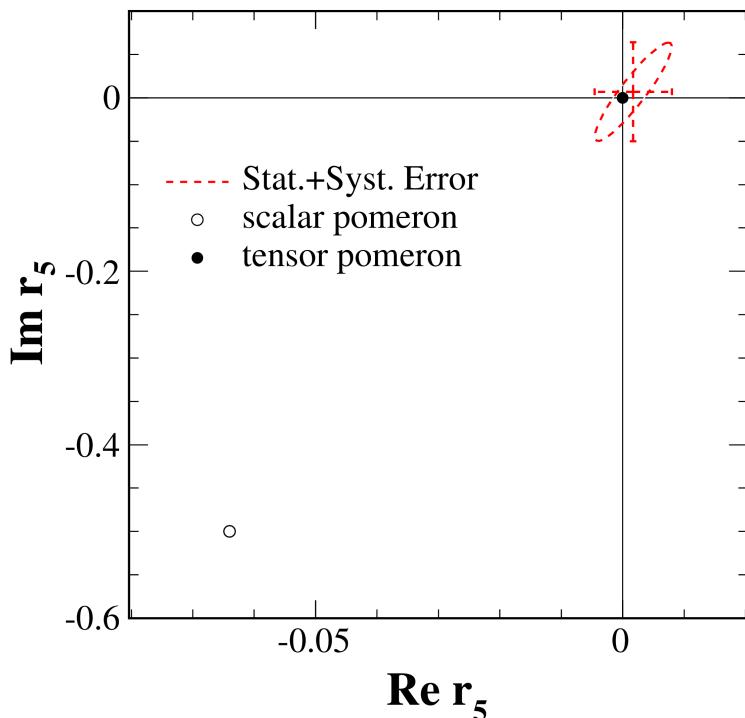

$$\alpha_{\mathbb{P}}(0) = 1.0808, \quad \alpha'_{\mathbb{P}} = 0.25 \text{ GeV}^{-2}$$

Comparison with experiment

C. Ewerz, P. L., O. Nachtmann, A. Szczerba, *Helicity in proton-proton elastic scattering and the spin structure of the pomeron*, Phys. Lett. B763 (2016) 382

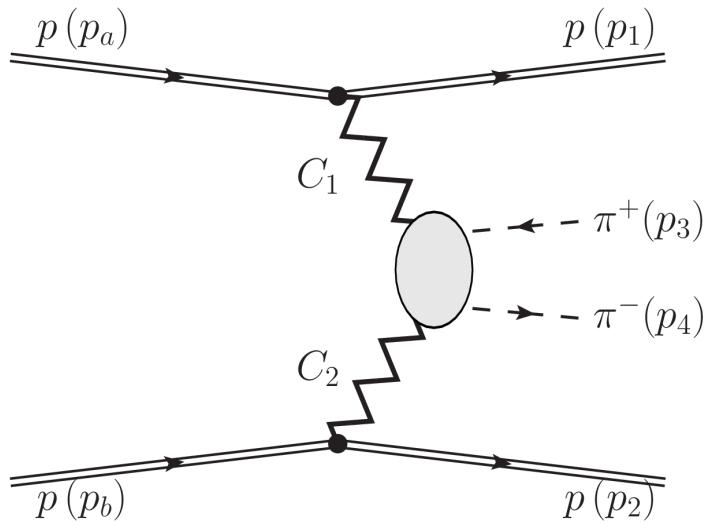

- Vector exchange has $C = -1$. It follows $\sigma_{tot}^{pp} = -\sigma_{tot}^{\bar{p}p}$
- We are left with \mathcal{IP}_T and \mathcal{IP}_S (both correspond to $C=+1$ exchanges)
- To decide between them we turn to the STAR experiment (Phys. Lett. B719 (2013)) which measured the single spin asymmetry in polarised pp elastic scattering.

Ratio of single-flip to non-flip amplitudes $r_5(s, t) = \frac{2m_p \phi_5(s, t)}{\sqrt{-t} \operatorname{Im}[\phi_1(s, t) + \phi_3(s, t)]}$

The tensor-pomeron result is compatible with the general rules of QFT and the STAR experimental result.

Dipion continuum production

$C = +1$ exchanges ($\mathbb{I}P, f_{2IR}, a_{2IR}$) are represented as rank-two tensor
 $C = -1$ exchanges (odderon (?), ω_{IR}, ρ_{IR}) are represented as vector

Exchange object	C	G
$\mathbb{I}P$	1	1
f_{2IR}	1	1
a_{2IR}	1	-1
γ	-1	
\mathbb{O}	-1	-1
ω_{IR}	-1	-1
ρ_{IR}	-1	1

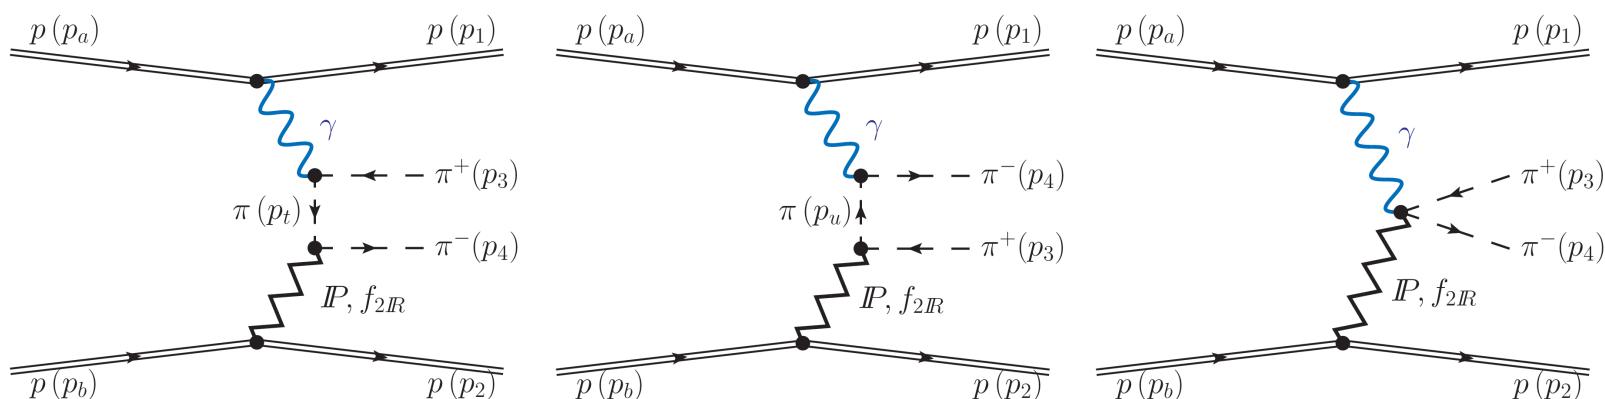

$$(C_1, C_2) = (1, 1) : (\mathbb{I}P + f_{2IR}, \mathbb{I}P + f_{2IR})$$

$$(C_1, C_2) = (-1, -1) : (\rho_{IR} + \gamma, \rho_{IR} + \gamma)$$

$$(C_1, C_2) = (1, -1) : (\mathbb{I}P + f_{2IR}, \rho_{IR} + \gamma)$$

$$(C_1, C_2) = (-1, 1) : (\rho_{IR} + \gamma, \mathbb{I}P + f_{2IR})$$

G parity invariance forbids the vertices:
 $a_{2IR}\pi\pi, \omega_{IR}\pi\pi, \mathbb{O}\pi\pi$

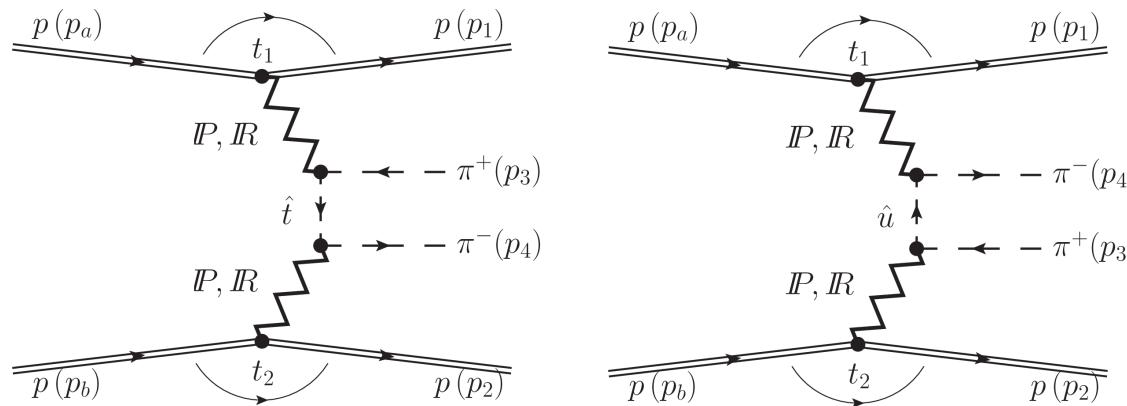

gauge invariant version of the Drell-Söding mechanism

Diffractive dipion continuum production

$$\mathcal{M}_{pp \rightarrow pp\pi^+\pi^-}^{\pi\pi\text{-continuum}} = \boxed{\mathcal{M}^{(IPIP \rightarrow \pi^+\pi^-)}} + \mathcal{M}^{(IPI_2R \rightarrow \pi^+\pi^-)} + \mathcal{M}^{(f_2RIP \rightarrow \pi^+\pi^-)} + \mathcal{M}^{(f_2RIf_2R \rightarrow \pi^+\pi^-)}$$

$$\mathcal{M}^{(IPIP \rightarrow \pi^+\pi^-)} = \mathcal{M}_{\lambda_a \lambda_b \rightarrow \lambda_1 \lambda_2 \pi^+ \pi^-}^{(\hat{t})} + \mathcal{M}_{\lambda_a \lambda_b \rightarrow \lambda_1 \lambda_2 \pi^+ \pi^-}^{(\hat{u})}$$

in terms of effective tensor pomeron propagator, proton and pion vertex functions

$$\begin{aligned} \mathcal{M}^{(\hat{t})} = & (-i)\bar{u}(p_1, \lambda_1)i\Gamma_{\mu_1 \nu_1}^{(IPIP)}(p_1, p_a)u(p_a, \lambda_a) i\Delta^{(IPI) \mu_1 \nu_1, \alpha_1 \beta_1}(s_{13}, t_1) i\Gamma_{\alpha_1 \beta_1}^{(IPI\pi\pi)}(p_t, -p_3) \\ & \times i\Delta^{(\pi)}(p_t) i\Gamma_{\alpha_2 \beta_2}^{(IPI\pi\pi)}(p_4, p_t) i\Delta^{(IPI) \alpha_2 \beta_2, \mu_2 \nu_2}(s_{24}, t_2) \bar{u}(p_2, \lambda_2)i\Gamma_{\mu_2 \nu_2}^{(IPIP)}(p_2, p_b)u(p_b, \lambda_b) \end{aligned}$$

$$i\Gamma_{\mu\nu}^{(IPI\pi\pi)}(k', k) = -i2\beta_{IPI\pi\pi} F_M((k' - k)^2) \left[(k' + k)_\mu (k' + k)_\nu - \frac{1}{4}g_{\mu\nu}(k' + k)^2 \right]$$

$$2 \times \beta_{IPI\pi\pi} = 2 \times 1.76 \text{ GeV}^{-1}, \quad F_M(t) = \frac{1}{1-t/\Lambda_0^2}, \quad \Lambda_0^2 = 0.5 \text{ GeV}^2$$

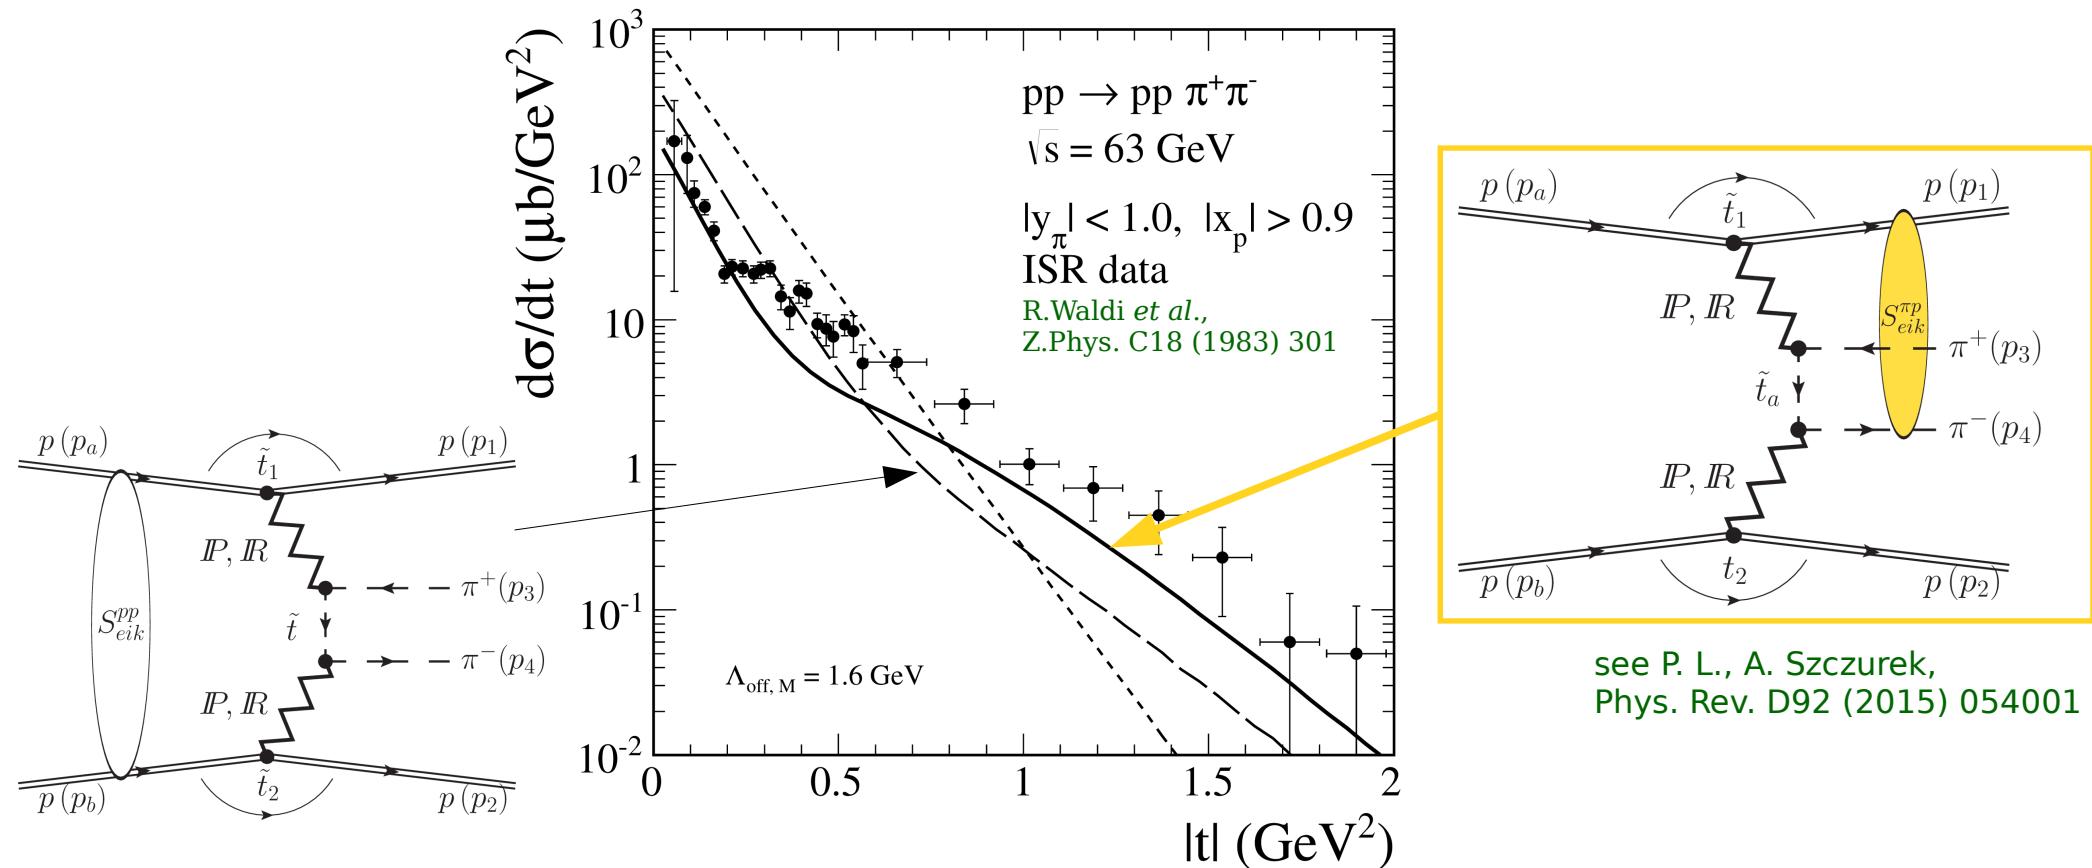

off-shell effects of intermediate pions

$$F_\pi(\hat{t}) = \exp\left(\frac{\hat{t} - m_\pi^2}{\Lambda_{off,E}^2}\right), \quad F_\pi(\hat{t}) = \frac{\Lambda_{off,M}^2 - m_\pi^2}{\Lambda_{off,M}^2 - \hat{t}}; \quad F_\pi(m_\pi^2) = 1$$

Absorption corrections

$$\mathcal{M}_{pp \rightarrow pp\pi^+\pi^-} = \mathcal{M}_{pp \rightarrow pp\pi^+\pi^-}^{Born} + \mathcal{M}_{pp \rightarrow pp\pi^+\pi^-}^{pp-rescattering} + \mathcal{M}_{pp \rightarrow pp\pi^+\pi^-}^{\pi p-rescattering}$$

$$\mathcal{M}_{pp \rightarrow pp\pi^+\pi^-}^{pp-rescattering}(s, \vec{p}_{1\perp}, \vec{p}_{2\perp}) = \frac{i}{8\pi^2 s} \int d^2 \vec{k}_\perp \mathcal{M}_{pp \rightarrow pp\pi^+\pi^-}^{Born}(s, \vec{p}_{1\perp} - \vec{k}_\perp, \vec{p}_{2\perp} + \vec{k}_\perp) \mathcal{M}_{pp \rightarrow pp}^{IP-exch.}(s, -\vec{k}_\perp^2)$$

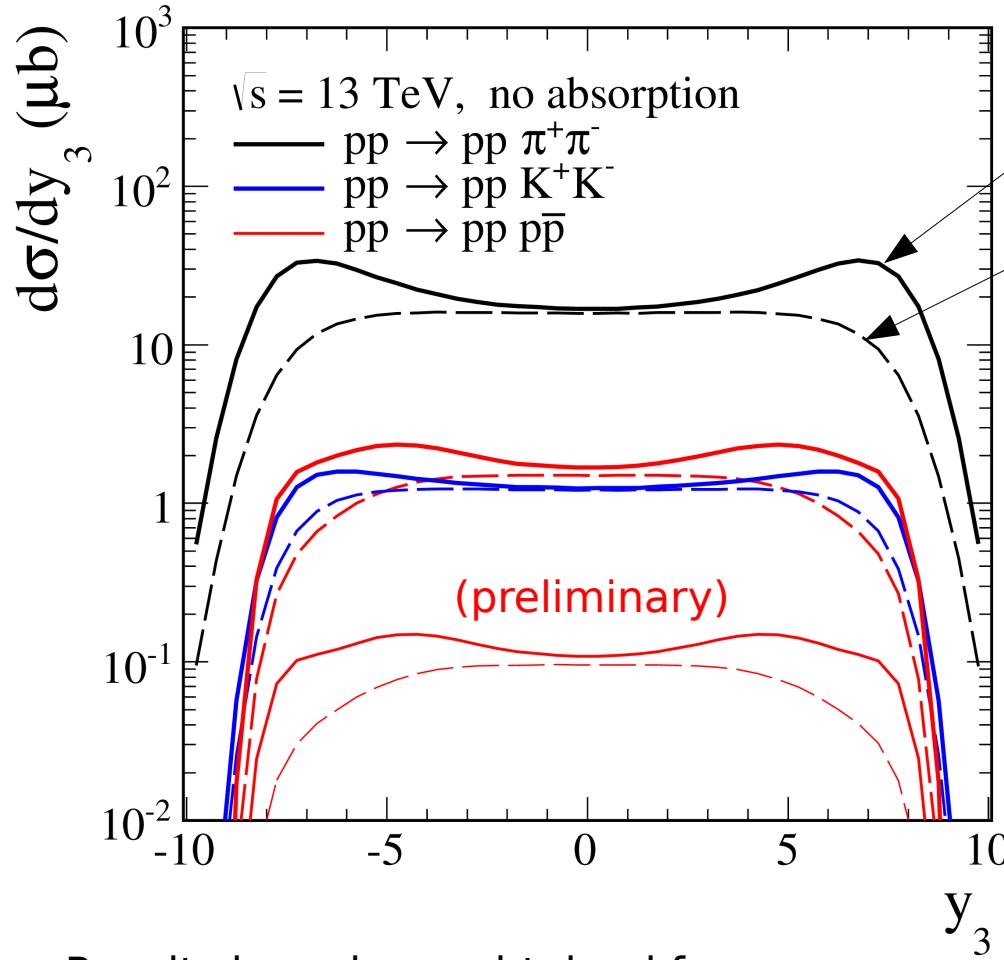

Absorption effects can be included effectively:

$$\frac{d\sigma^{absorbed}}{dM_{\pi\pi}} = \frac{d\sigma^{Born}}{dM_{\pi\pi}} \times \langle S^2 \rangle$$

ratio of full (absorbed)-to-Born cross section:

$$\begin{aligned} \langle S^2 \rangle &\simeq 0.1 - 0.2 \text{ for diffractive processes at LHC} \\ \langle S^2 \rangle &\simeq 0.8 - 0.9 \text{ for photoproduction at LHC} \end{aligned}$$

Diffractive continuum mechanism

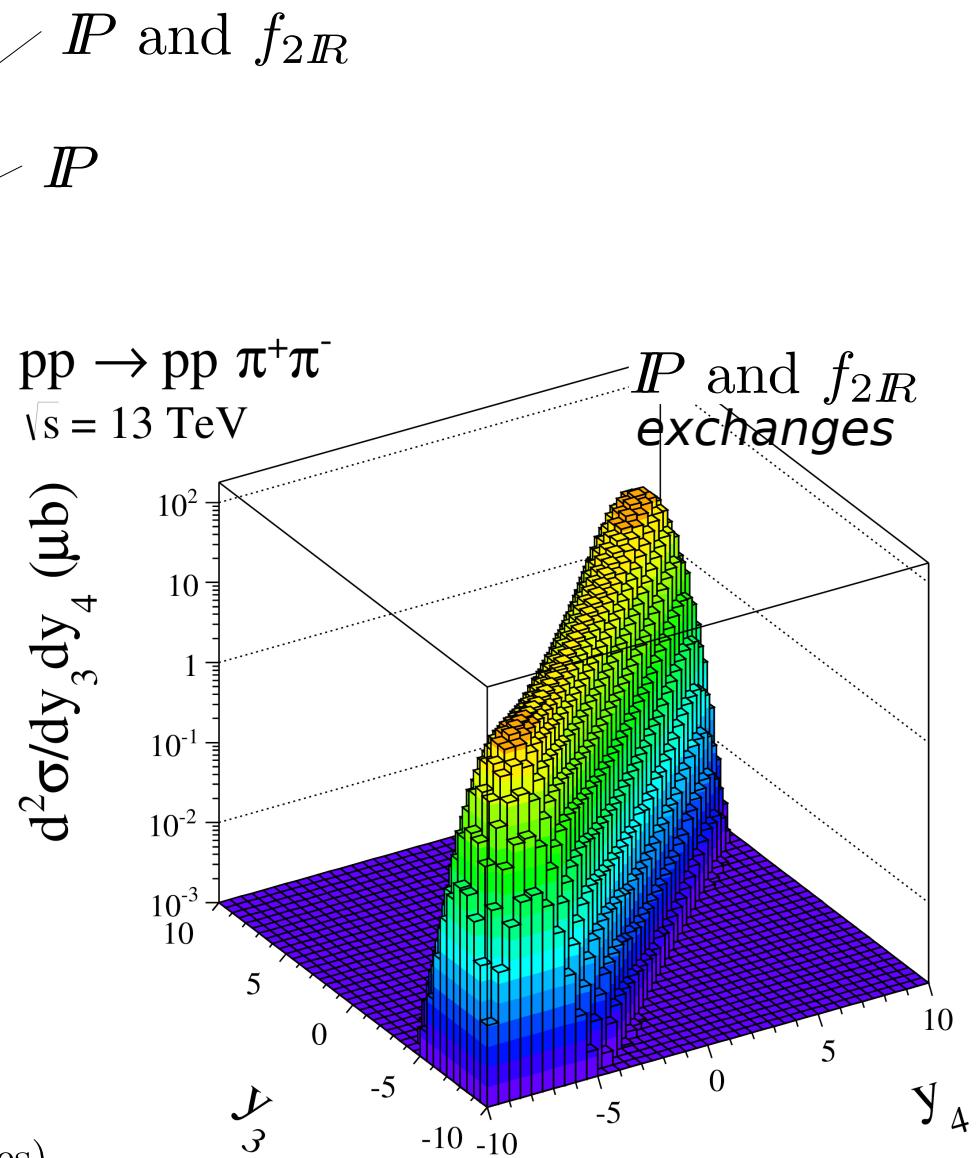

Results have been obtained for

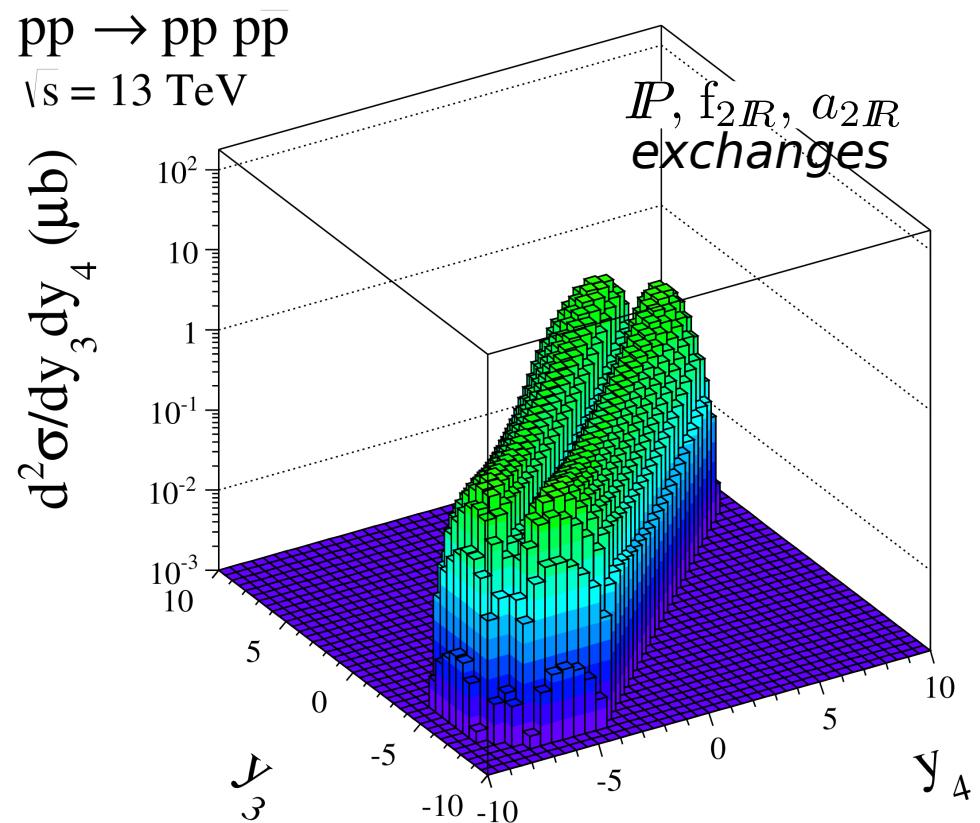

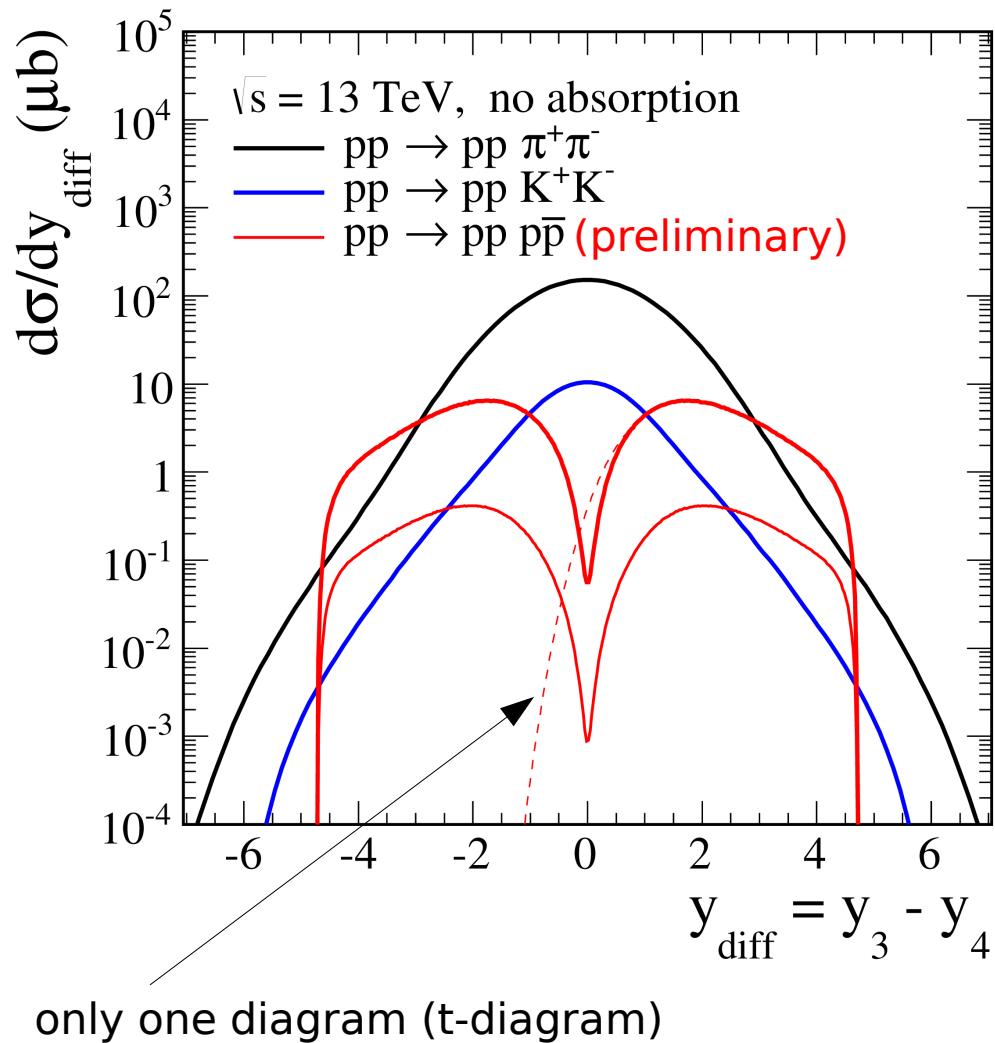

$$\Lambda_{off,E}^{(\pi)} = 1 \text{ GeV} \text{ (black lines)}$$

$$\Lambda_{off,E}^{(K)} = 1 \text{ GeV} \text{ (blue lines)}$$

$$\Lambda_{off,E}^{(p)} = 0.8 \text{ GeV} \text{ (lower red lines)}, 1 \text{ GeV} \text{ (upper red lines)}$$

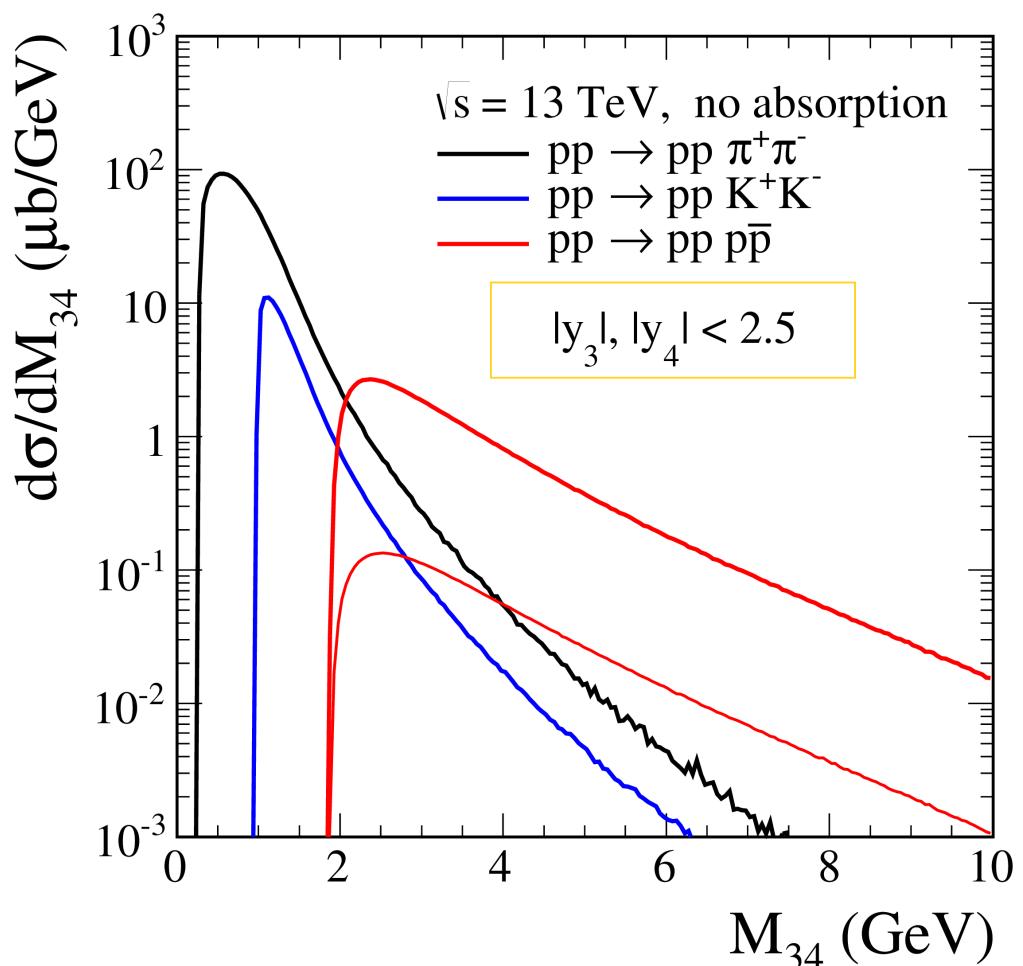

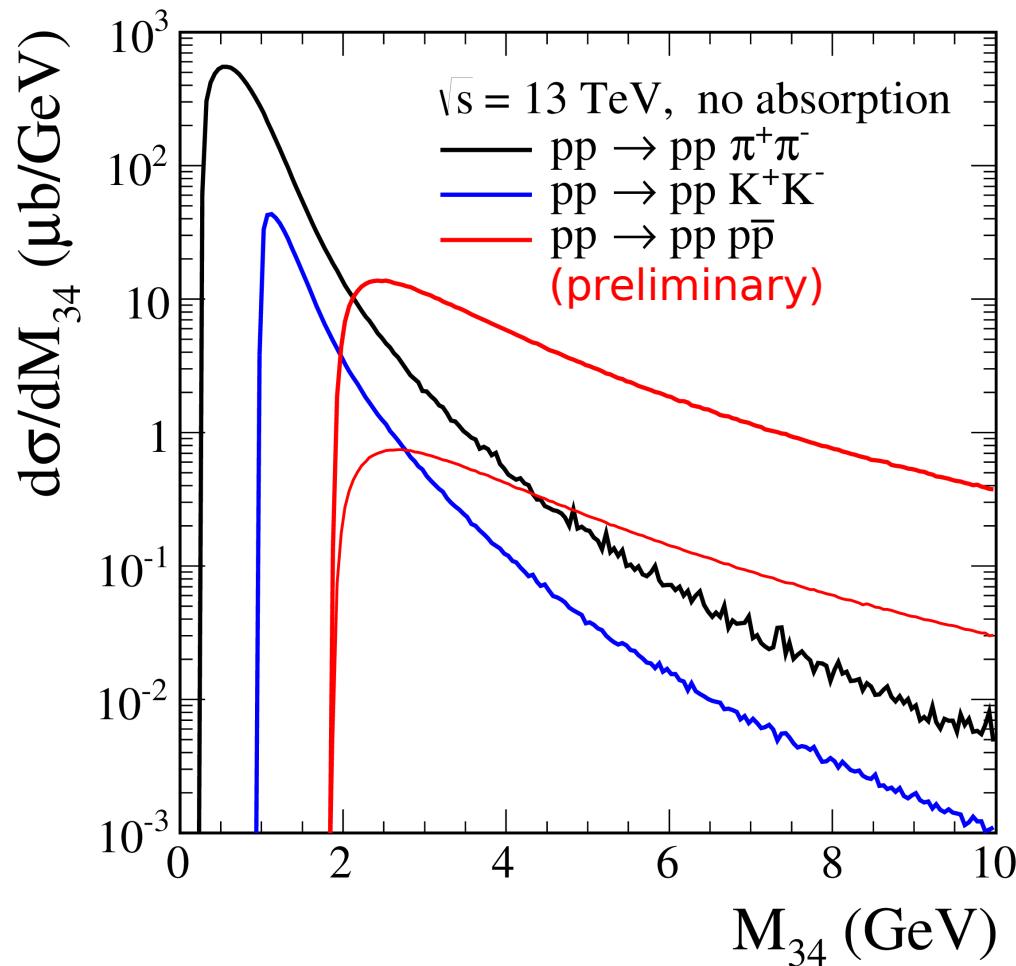

Diffractive continuum mechanism

One can observe that the dip extends over a whole diagonal in (y_3, y_4) space.

Diffractive continuum mechanism

Results have been obtained for

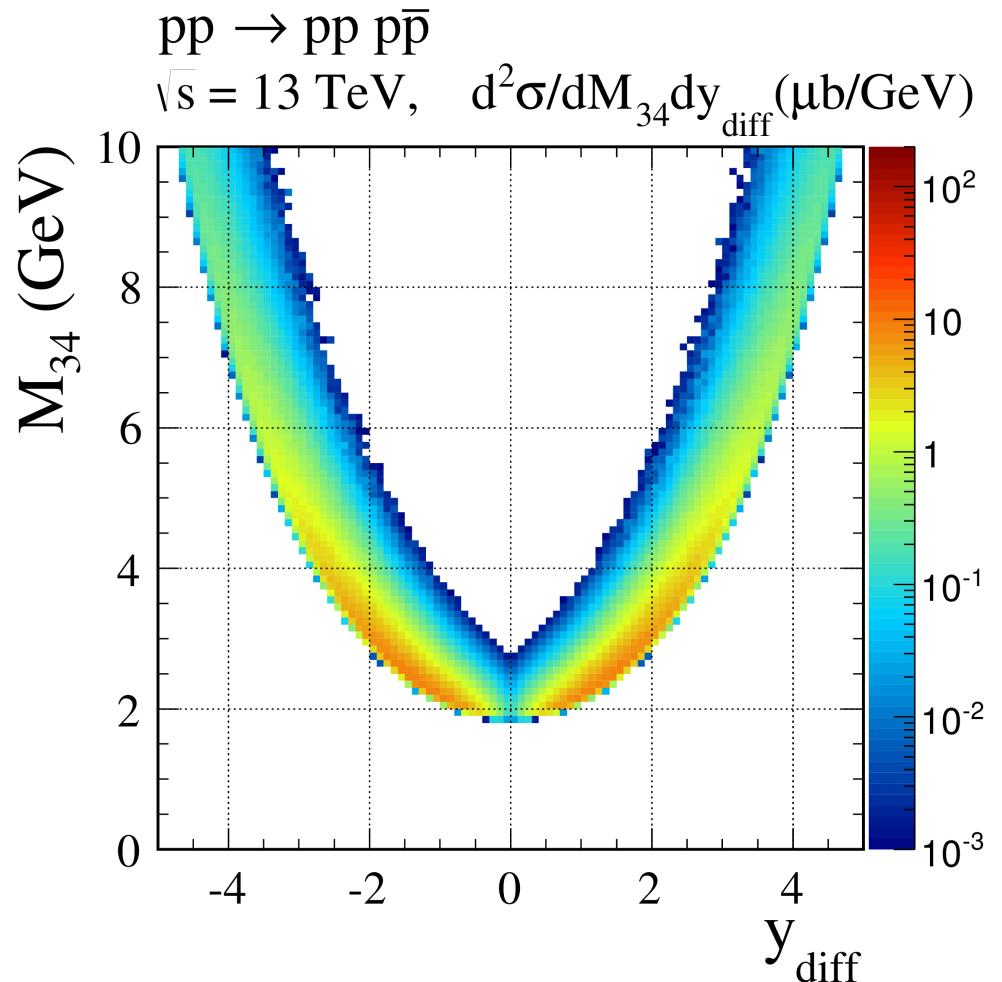

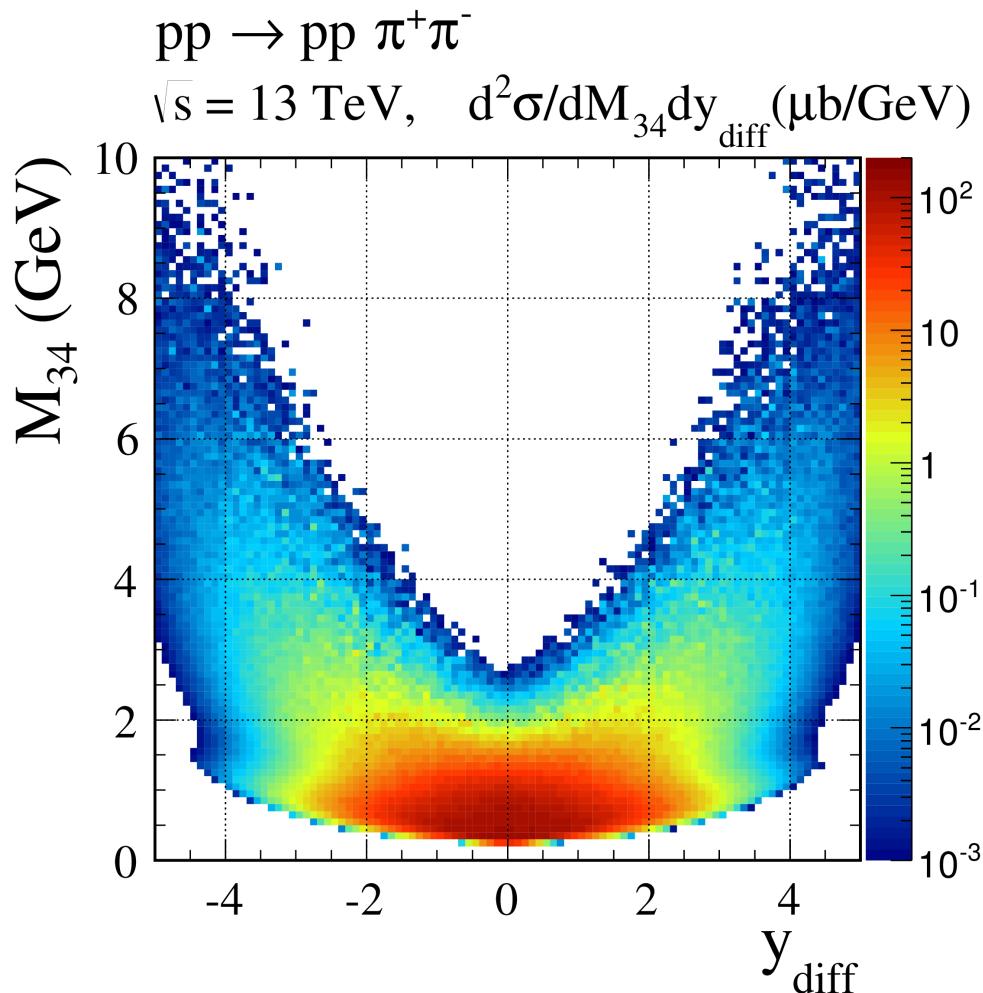

$$\Lambda_{off,E}^{(\pi)} = 1 \text{ GeV} \text{ (black line)}$$

$$\Lambda_{off,E}^{(K)} = 1 \text{ GeV} \text{ (blue line)}$$

$$\Lambda_{off,E}^{(p)} = 1 \text{ GeV} \text{ (upper red line)}, 0.8 \text{ GeV} \text{ (lower red line)}$$

We predict also less steep dependence of pp invariant mass distribution than for the dimeson pairs.

Diffractive continuum mechanism

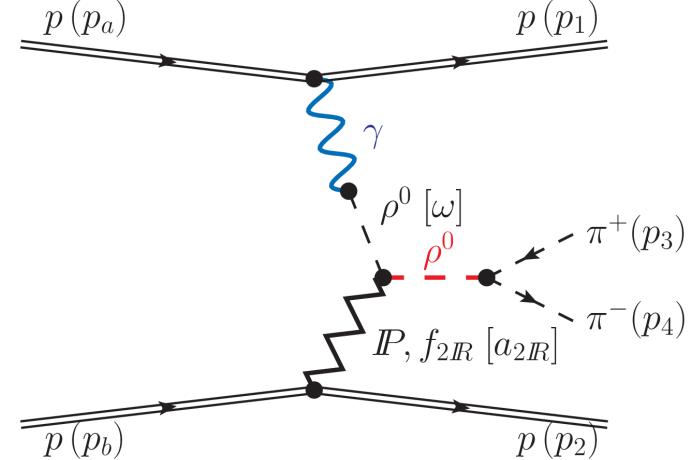

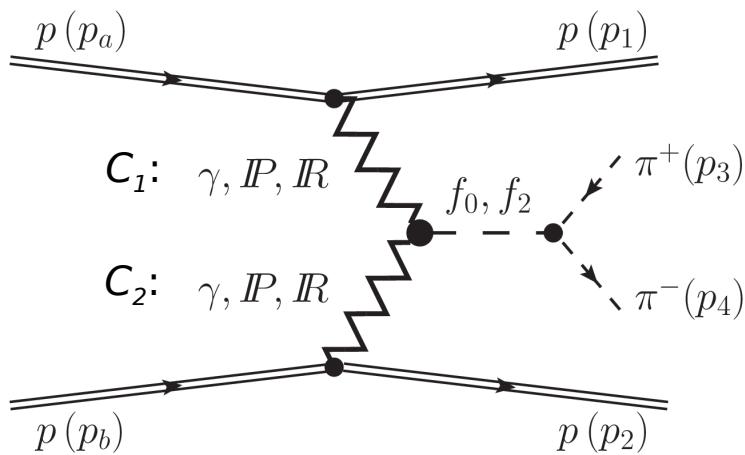

One can observe characteristic ridge at the edge of the $(M_{34}, y_{\text{diff}})$ space.
 The interior is then free of the diffractive continuum.

Any experimentally observed distortions from the present predictions may therefore signal a presence of resonances.
 Then possible identification of $p\bar{p}$ resonances should be easier.

Dipion resonant production

$$\mathcal{M}_{pp \rightarrow pp\pi^+\pi^-} = \mathcal{M}_{pp \rightarrow pp\pi^+\pi^-}^{\pi\pi\text{-continuum}} + \boxed{\mathcal{M}_{pp \rightarrow pp\pi^+\pi^-}^{\pi\pi\text{-resonances}}}$$

In general, many exchanges are possible in the dipion resonance production process.

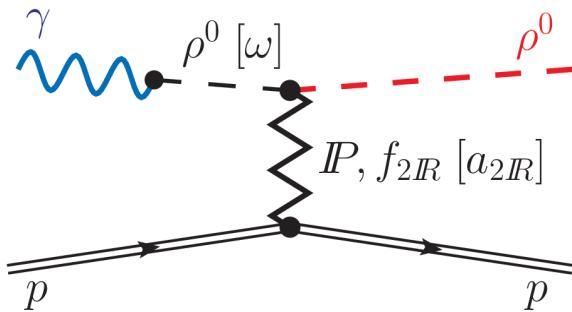

$I^G J^{PC}$, resonances	(C_1, C_2) production modes
0^+0^{++} , $f_0(500)$, $f_0(980)$, $f_0(1500)$, $f_0(1370)$, $f_0(1710)$	$\{(IP + f_{2IR}, IP + f_{2IR}), (a_{2IR}, a_{2IR}), (\mathbb{O} + \omega_{IR} + \gamma, \mathbb{O} + \omega_{IR} + \gamma), (\rho_{IR}, \rho_{IR}), (\gamma, \rho_{IR}), (\rho_{IR}, \gamma)\}$
0^+2^{++} , $f_2(1270)$, $f'_2(1525)$, $f_2(1950)$	
0^+4^{++} , $f_4(2050)$	
1^+1^{--} , $\rho(770)$, $\rho(1450)$, $\rho(1700)$	$\{(\gamma + \rho_{IR}, IP + f_{2IR}), (IP + f_{2IR}, \gamma + \rho_{IR}), (\mathbb{O} + \omega_{IR}, a_{2IR}), (a_{2IR}, \mathbb{O} + \omega_{IR})\}$
1^+3^{--} , $\rho_3(1690)$	

At high energies, we shall concentrate on the dominant (C_1, C_2) contributions:

$(IP + f_{2IR}, IP + f_{2IR})$ for purely diffractive mechanism;

$(\gamma, IP + f_{2IR}), (IP + f_{2IR}, \gamma)$ for photoproduction mechanism.

Photoproduction of ρ^0 meson

$$\mathcal{M}_{\lambda_\gamma \lambda_b \rightarrow \lambda_\rho \lambda_2}(s, t) \cong ie \frac{m_\rho^2}{\gamma_\rho} \Delta_T^{(\rho)}(0) (\epsilon^{(\rho)\mu})^* \epsilon^{(\gamma)\nu} V_{\mu\nu\kappa\lambda}(s, t, q, p_\rho)$$

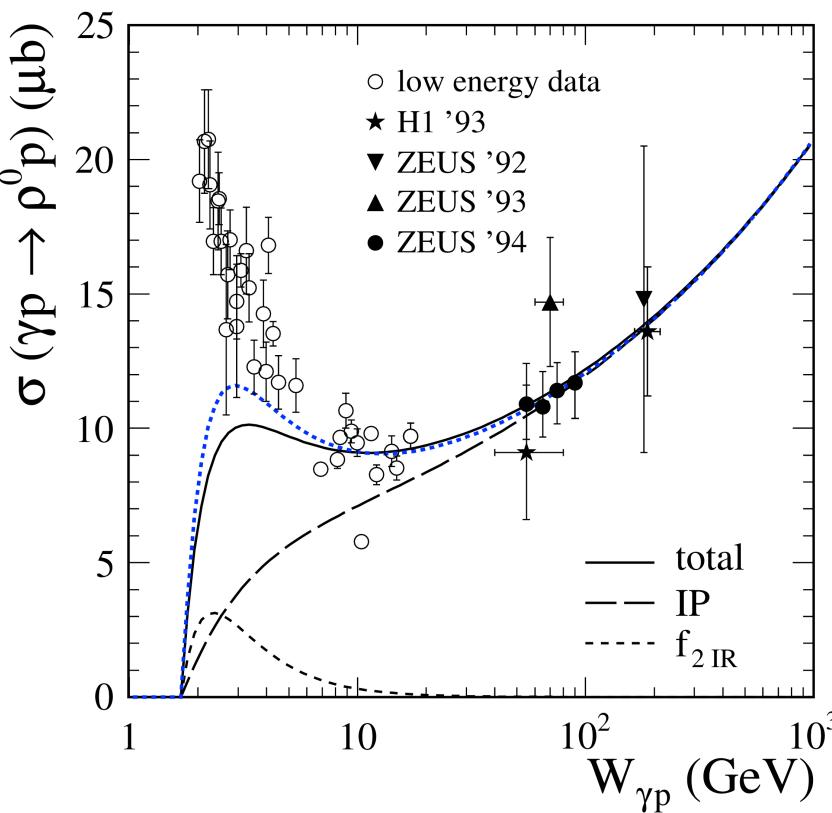

$$\times 2(p_2 + p_b)^\kappa (p_2 + p_b)^\lambda \delta_{\lambda_2 \lambda_b} F_1(t) F_M(t)$$

alternatively, $F_1(t) F_M(t) \rightarrow$ factorised form $F_{\rho\rho}^{(P/R)}(t) = \exp\left(\frac{B_{\rho\rho}^{(P/R)} t}{2}\right)$
(see the blue dotted line)

$$V_{\mu\nu\kappa\lambda}(s, t, q, p_\rho) = \frac{1}{4s} \left\{ 2\Gamma_{\mu\nu\kappa\lambda}^{(0)}(p_\rho, -q) \left[3\beta_{IPNN} a_{IP\rho\rho} (-is\alpha'_{IP})^{\alpha_{IP}(t)-1} + M_0^{-1} g_{f2IRpp} a_{f2IR\rho\rho} (-is\alpha'_{IR+})^{\alpha_{IR+}(t)-1} \right] \right.$$

$$\left. - \Gamma_{\mu\nu\kappa\lambda}^{(2)}(p_\rho, -q) \left[3\beta_{IPNN} b_{IP\rho\rho} (-is\alpha'_{IP})^{\alpha_{IP}(t)-1} + M_0^{-1} g_{f2IRpp} b_{f2IR\rho\rho} (-is\alpha'_{IR+})^{\alpha_{IR+}(t)-1} \right] \right\}$$

tensorial functions: C. Ewerz, M. Maniatis and O. Nachtmann, Ann. Phys. 342 (2014) 31

The coupling constants $IP/IR-\rho-\rho$ have been estimated from parametrization of total cross sections for πp scattering assuming

$$\sigma_{tot}(\rho^0(\lambda_\rho = \pm 1), p) = \frac{1}{2} [\sigma_{tot}(\pi^+, p) + \sigma_{tot}(\pi^-, p)]$$

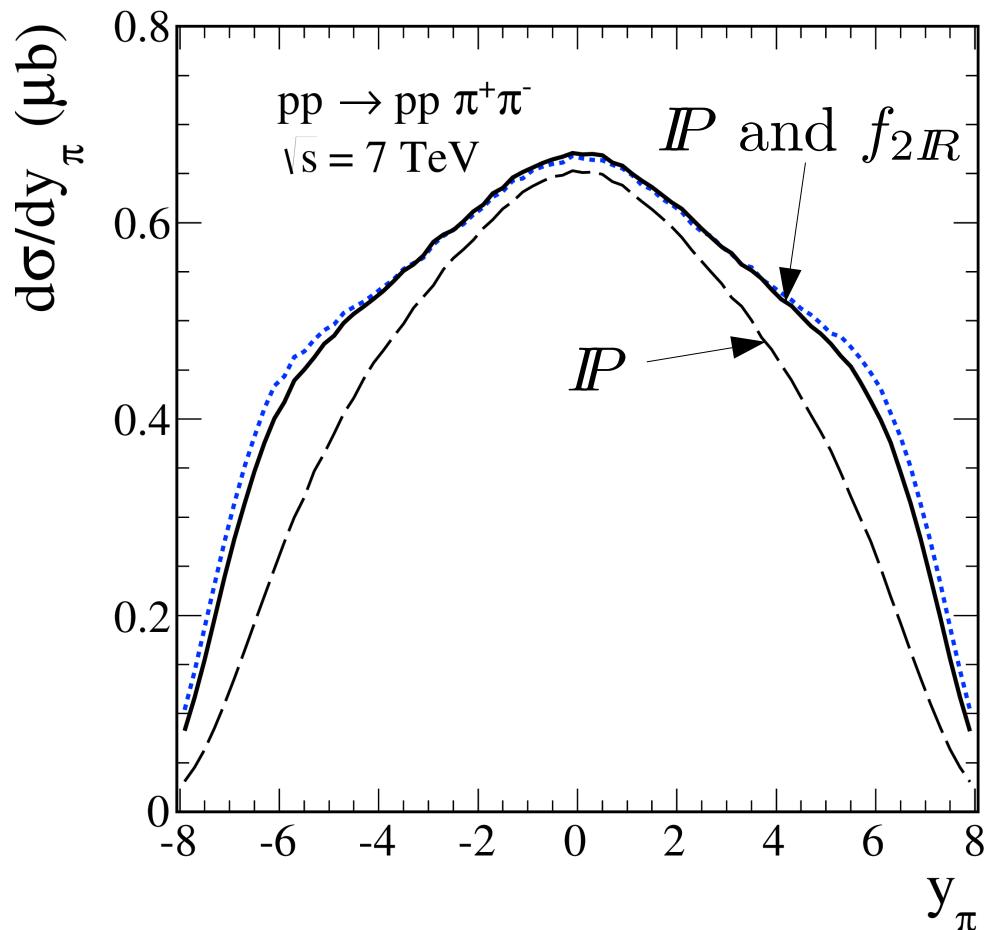

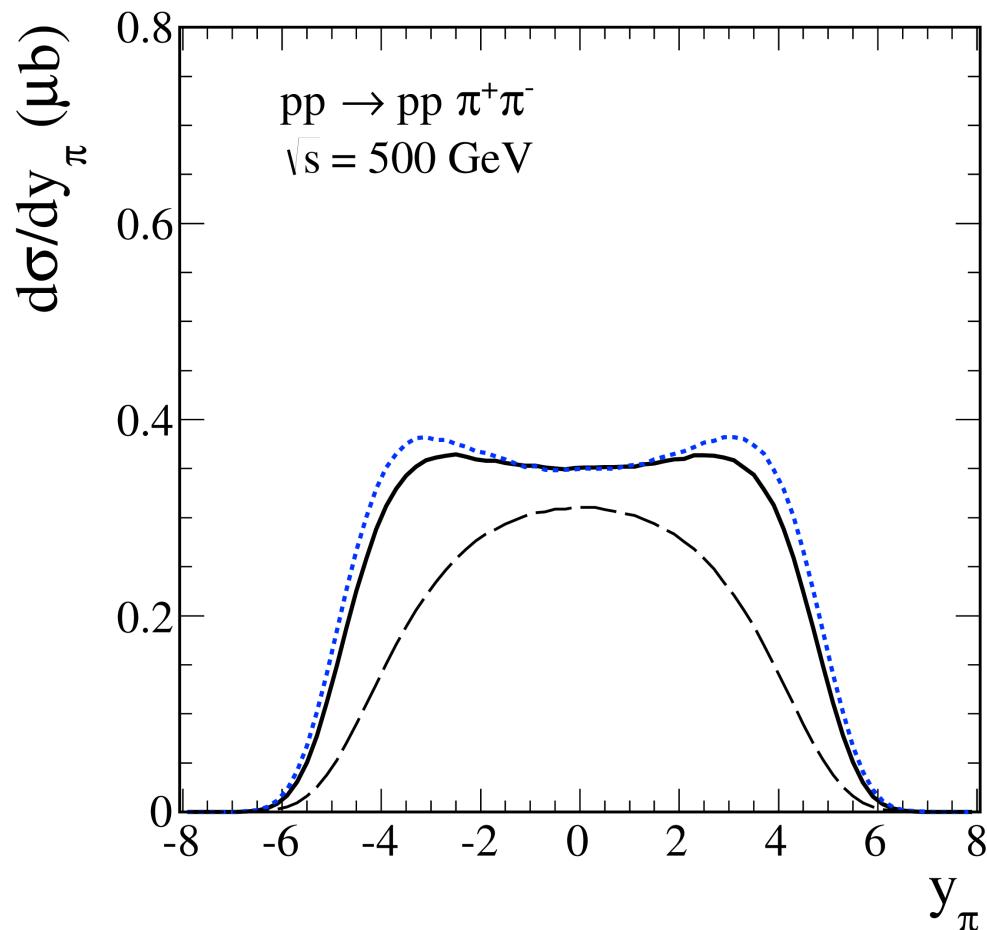

and are expected to approximately fulfill:

$$2m_\rho^2 a_{IP\rho\rho} + b_{IP\rho\rho} = 4\beta_{IP\pi\pi} = 7.04 \text{ GeV}^{-1}$$

$$2m_\rho^2 a_{f2IR\rho\rho} + b_{f2IR\rho\rho} = M_0^{-1} g_{f2IR\pi\pi} = 9.30 \text{ GeV}^{-1}$$

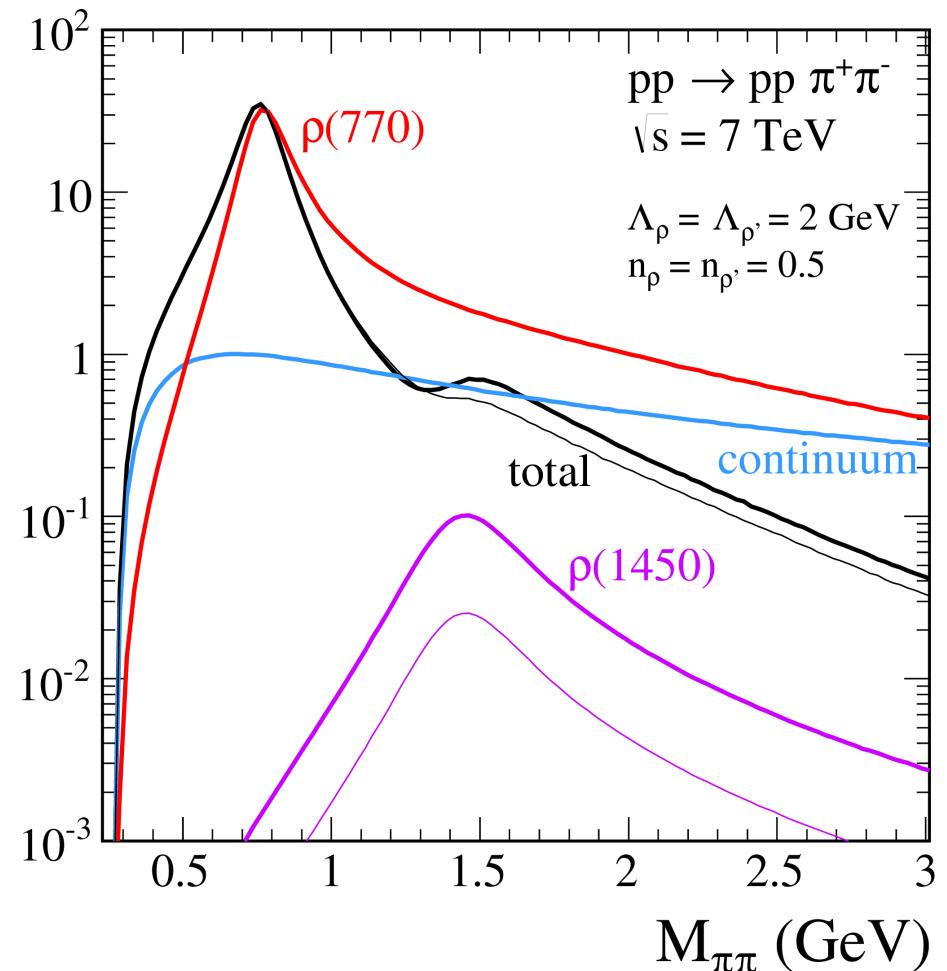

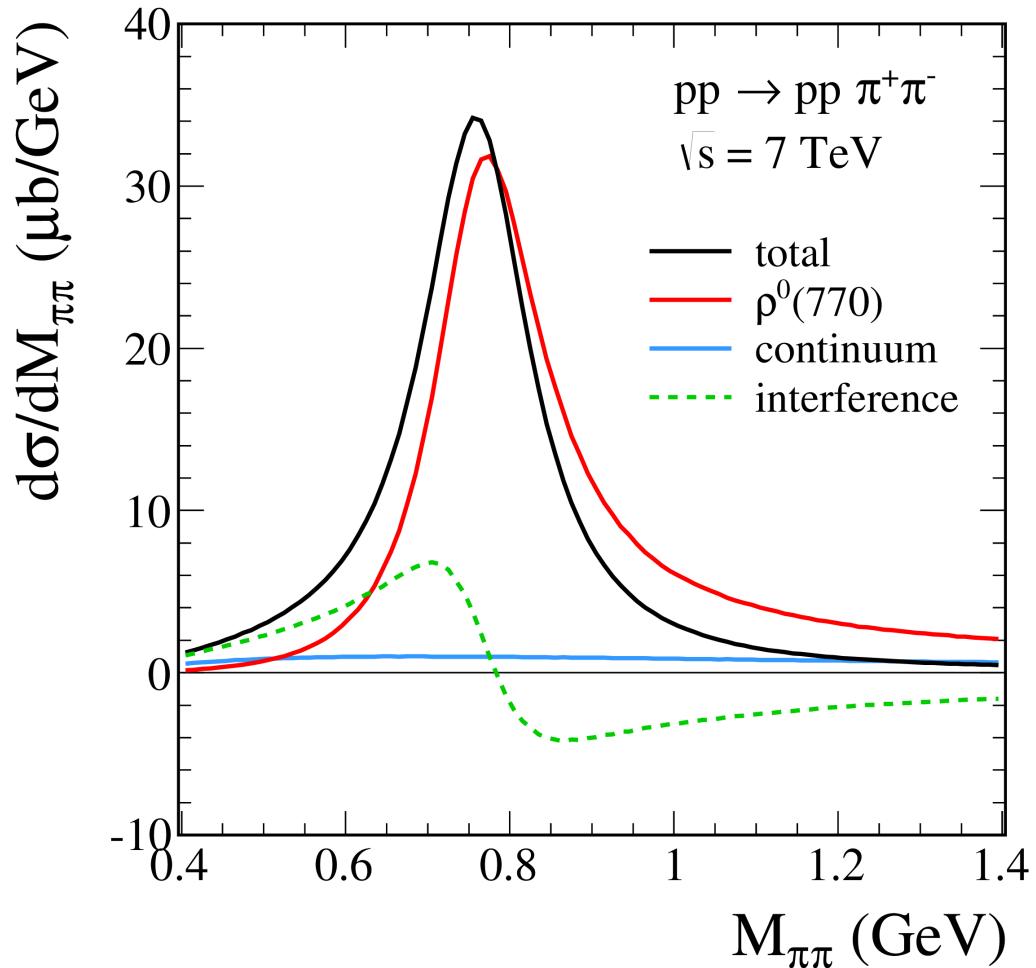

$$M_0 = 1 \text{ GeV}$$

Photoproduction mechanism: ρ^0 and $\pi^+\pi^-$ continuum

The f_2 reggeon exchange included in the amplitude contributes mainly at backward and forward pion rapidities. Its contribution is non-negligible even at the LHC.

Photoproduction mechanism: ρ^0 and $\pi^+\pi^-$ continuum

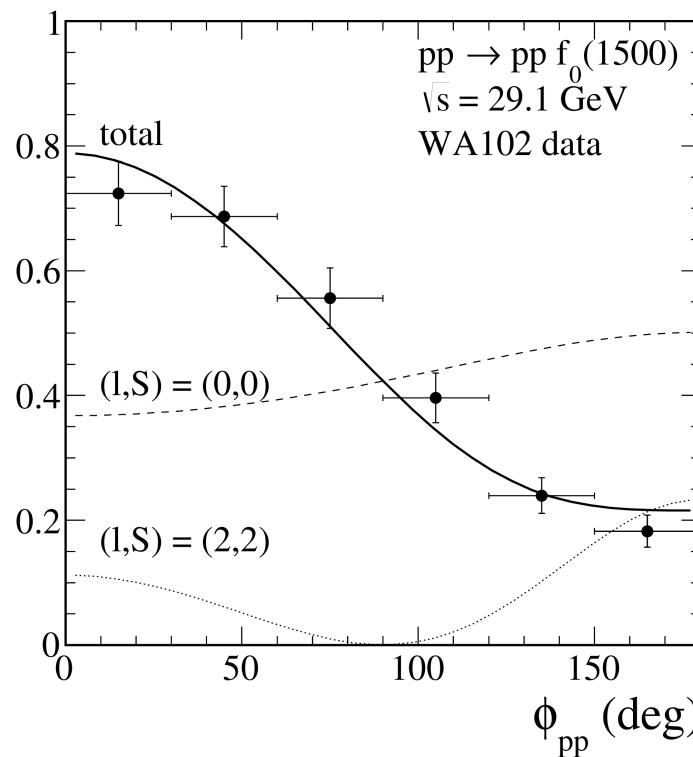

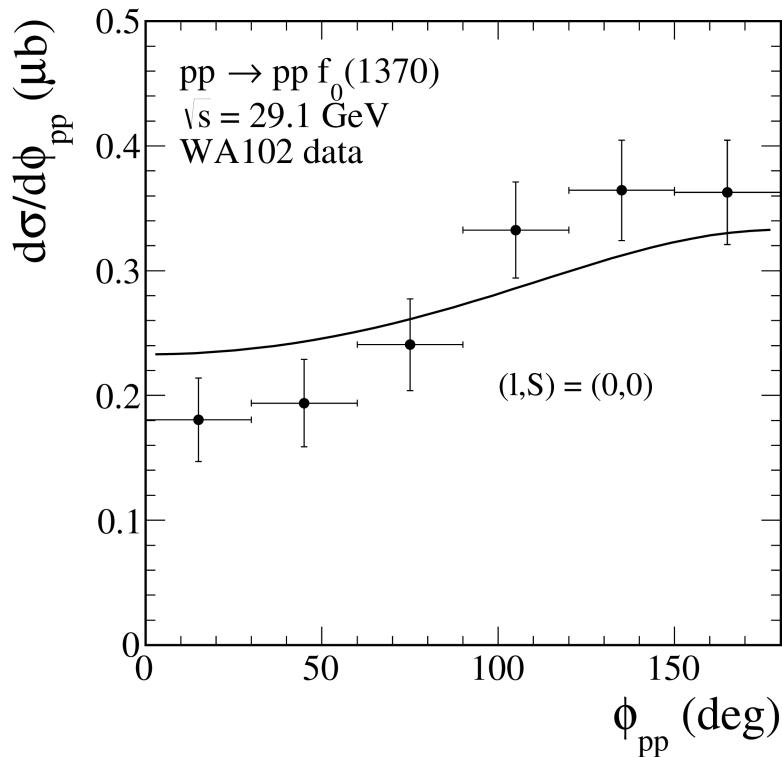

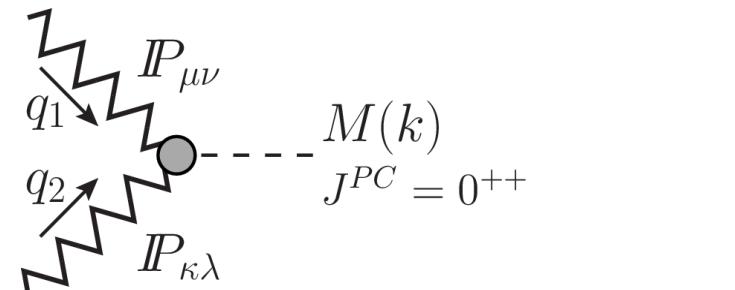

The non-resonant (Drell-Söding) contribution interferes with resonant ρ contributions
 \rightarrow skewing of ρ^0 line shape.

Diffractive mechanism: scalar resonances

For a scalar mesons the “bare” tensorial $IP\text{-}IP\text{-}M$ vertices corresponding to $(l,S) = (0,0)$ and $(2,2)$ terms are

$$i\Gamma'_{\mu\nu,\kappa\lambda}^{(IP\text{-}IP\rightarrow M)} = i g'_{IP\text{-}IP\text{-}M} M_0 \left(g_{\mu\kappa}g_{\nu\lambda} + g_{\mu\lambda}g_{\nu\kappa} - \frac{1}{2}g_{\mu\nu}g_{\kappa\lambda} \right)$$

$$i\Gamma''_{\mu\nu,\kappa\lambda}^{(IP\text{-}IP\rightarrow M)}(q_1, q_2) = \frac{i g''_{IP\text{-}IP\text{-}M}}{2M_0} [q_{1\kappa}q_{2\mu}g_{\nu\lambda} + q_{1\kappa}q_{2\nu}g_{\mu\lambda} + q_{1\lambda}q_{2\mu}g_{\nu\kappa} + q_{1\lambda}q_{2\nu}g_{\mu\kappa} - 2(q_1 \cdot q_2)(g_{\mu\kappa}g_{\nu\lambda} + g_{\nu\kappa}g_{\mu\lambda})]$$

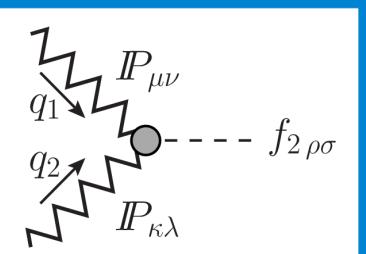

$f_0(1370)$ peaks as $\phi_{pp} \rightarrow \pi$
 $f_0(980), f_0(1500), f_0(1710)$ peak at $\phi_{pp} \rightarrow 0$
Our results and WA102 data have been normalized to the mean value of the total cross section given by A. Kirk, Phys. Lett. B489 (2000) 29.

In most cases one has to add coherently amplitudes for two lowest (l, S) couplings.

Diffractive mechanism: $f_2(1270)$

The amplitude for the process $pp \rightarrow pp (f_2 \rightarrow \pi^+ \pi^-)$ via $\mathbb{IP}\mathbb{IP}$ fusion:

$$\begin{aligned} \mathcal{M}_{\lambda_a \lambda_b \rightarrow \lambda_1 \lambda_2 \pi^+ \pi^-}^{(\mathbb{IP}\mathbb{IP} \rightarrow f_2 \rightarrow \pi^+ \pi^-)} = & (-i) \bar{u}(p_1, \lambda_1) i\Gamma_{\mu_1 \nu_1}^{(\mathbb{IP}pp)}(p_1, p_a) u(p_a, \lambda_a) i\Delta^{(\mathbb{IP}) \mu_1 \nu_1, \alpha_1 \beta_1}(s_1, t_1) \\ & \times i\Gamma_{\alpha_1 \beta_1, \alpha_2 \beta_2, \rho \sigma}^{(\mathbb{IP}f_2)}(q_1, q_2) i\Delta^{(f_2) \rho \sigma, \alpha \beta}(p_{34}) i\Gamma_{\alpha \beta}^{(f_2 \pi \pi)}(p_3, p_4) \\ & \times i\Delta^{(\mathbb{IP}) \alpha_2 \beta_2, \mu_2 \nu_2}(s_2, t_2) \bar{u}(p_2, \lambda_2) i\Gamma_{\mu_2 \nu_2}^{(\mathbb{IP}pp)}(p_2, p_b) u(p_b, \lambda_b), \end{aligned}$$

$$i\Gamma_{\mu\nu, \kappa\lambda, \rho\sigma}^{(\mathbb{IP}\mathbb{IP}f_2)}(q_1, q_2) = \left(i\Gamma_{\mu\nu, \kappa\lambda, \rho\sigma}^{(\mathbb{IP}\mathbb{IP}f_2)(1)}|_{bare} + \sum_{j=2}^7 i\Gamma_{\mu\nu, \kappa\lambda, \rho\sigma}^{(\mathbb{IP}\mathbb{IP}f_2)(j)}(q_1, q_2)|_{bare} \right) \tilde{F}^{(\mathbb{IP}\mathbb{IP}f_2)}(q_1^2, q_2^2, p_{34}^2).$$

Here $p_{34} = q_1 + q_2$ and the form factor $\tilde{F}^{(\mathbb{IP}\mathbb{IP}f_2)} = F_M(q_1^2)F_M(q_2^2)F^{(\mathbb{IP}\mathbb{IP}f_2)}(p_{34}^2)$.

$$i\Delta_{\mu\nu, \kappa\lambda}^{(f_2)}(p_{34}) = \frac{i}{p_{34}^2 - m_{f_2}^2 + im_{f_2}\Gamma_{f_2}} \left[\frac{1}{2}(\hat{g}_{\mu\kappa}\hat{g}_{\nu\lambda} + \hat{g}_{\mu\lambda}\hat{g}_{\nu\kappa}) - \frac{1}{3}\hat{g}_{\mu\nu}\hat{g}_{\kappa\lambda} \right],$$

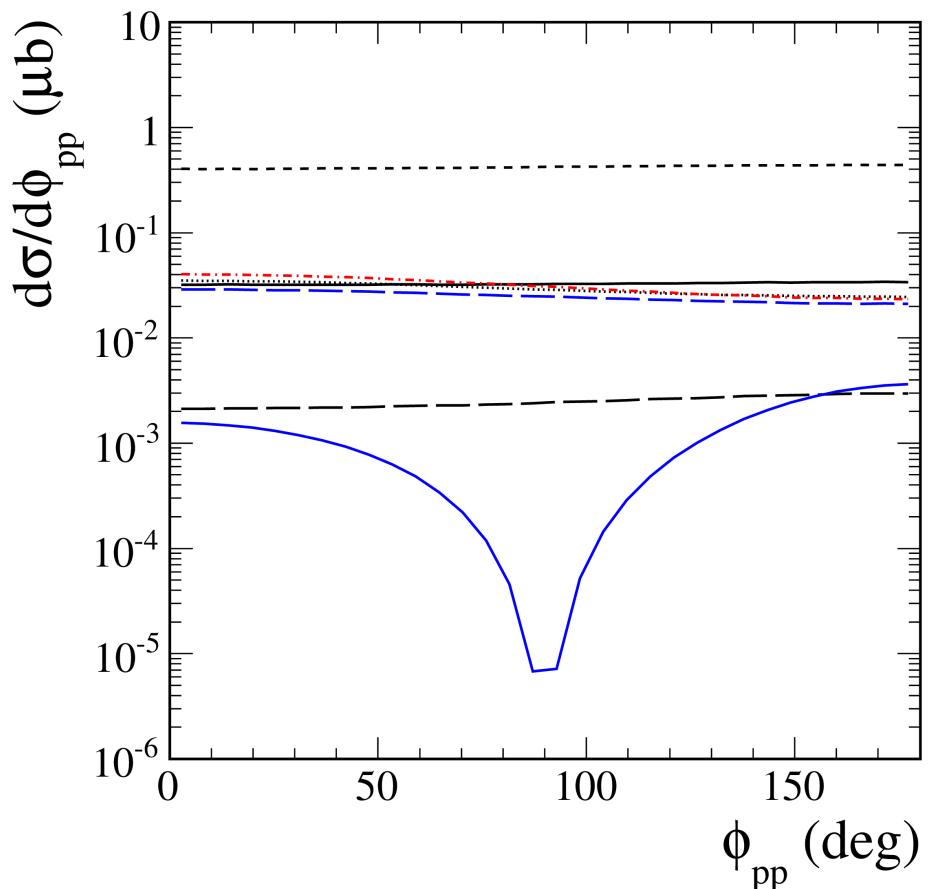

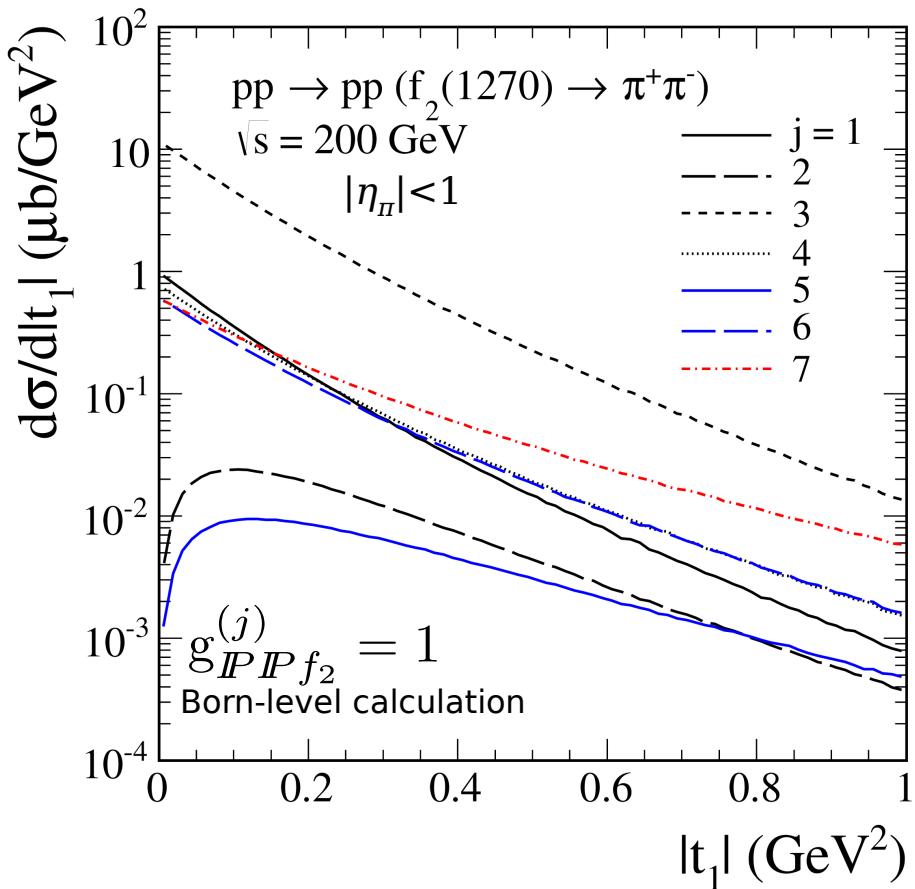

where $\hat{g}_{\mu\nu} = -g_{\mu\nu} + p_{34\mu}p_{34\nu}/p_{34}^2$ and $\Delta_{\nu\mu, \kappa\lambda}^{(f_2)}(p_{34}) = \Delta_{\mu\nu, \lambda\kappa}^{(f_2)}(p_{34}) = \Delta_{\kappa\lambda, \mu\nu}^{(f_2)}(p_{34})$, $g^{\kappa\lambda}\Delta_{\mu\nu, \kappa\lambda}^{(f_2)}(p_{34}) = 0$.

$$i\Gamma_{\mu\nu}^{(f_2 \pi \pi)}(p_3, p_4) = -i \frac{g_{f_2 \pi \pi}}{2M_0} \left[(p_3 - p_4)_\mu (p_3 - p_4)_\nu - \frac{1}{4}g_{\mu\nu}(p_3 - p_4)^2 \right] F^{(f_2 \pi \pi)}(p_{34}^2),$$

where $g_{f_2 \pi \pi} = 9.26$ was obtained from the corresponding partial decay width.

We assume that $F^{(f_2 \pi \pi)}(p_{34}^2) = F^{(\mathbb{IP}\mathbb{IP}f_2)}(p_{34}^2) = \exp\left(\frac{-(p_{34}^2 - m_{f_2}^2)^2}{\Lambda_{f_2}^4}\right)$, $\Lambda_{f_2} = 1$ GeV.

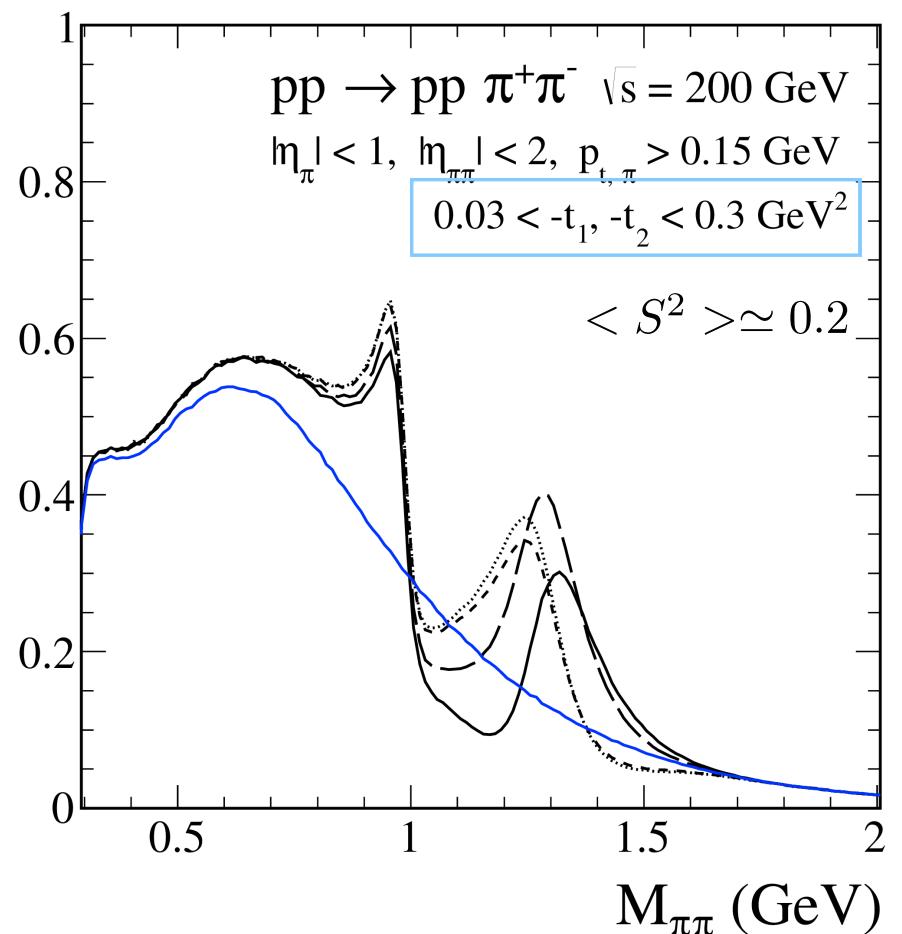

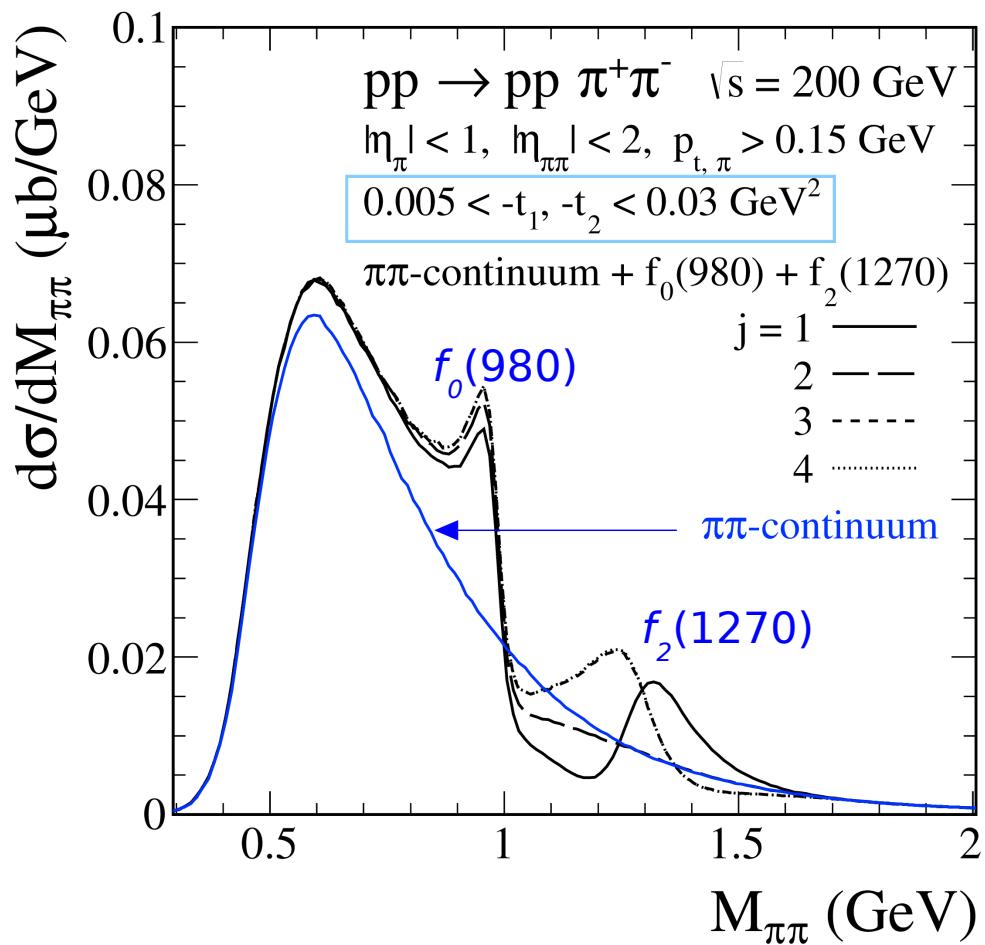

Diffractive mechanism: tensor resonance

We can associate the couplings $j = 1, \dots, 7$ with the following (l, S) values:
 $(0, 2), (2, 0) - (2, 2), (2, 0) + (2, 2), (2, 4), (4, 2), (4, 4), (6, 4)$, respectively.

$j = 2$ coupling is in agreement with experimental observations (WA102, COMPASS, ISR)
 $\rightarrow f_2(1270)$ peaks at $\phi_{pp} \sim 180^\circ$ and is most prominently observed at large $|t|$

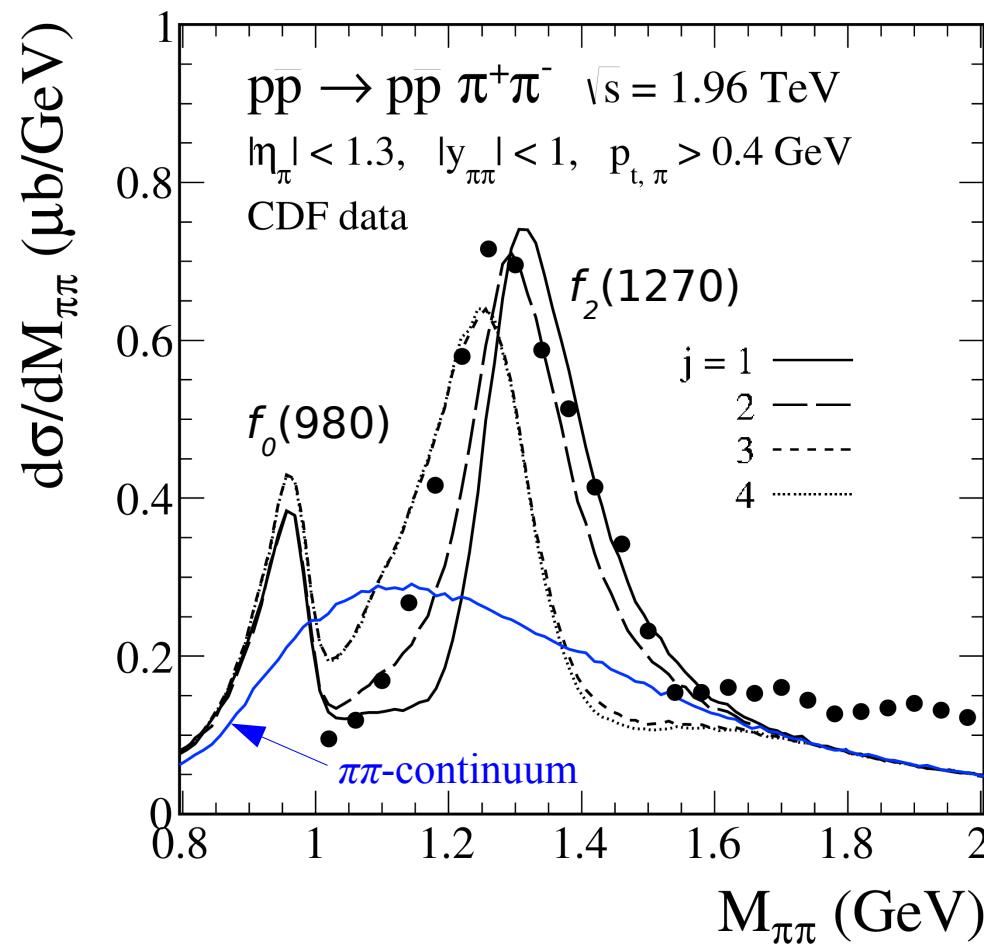

Diffractive mechanism: tensor resonance

Different couplings generate different interference pattern. The relative contribution of the resonant $f_2(1270)$ and dipion continuum strongly depends on the cut on $|t|$

→ this may explain some observation made by the ISR groups (AFS, ABCDHW)

Comparison with CDF data

Events with two oppositely charged particles, assumed to be pions, and no other particles detected in $|\eta| < 5.9$.
(no proton tagging → rapidity gap method)

The visible structure attributed to f_0 and $f_2(1270)$ mesons which interfere with the continuum.

We assume that the peak in the region 1.2 – 1.4 GeV corresponds mainly to the $f_2(1270)$ resonance.

We have adjusted the $j = 1, \dots, 4$ couplings to get the same cross section in the region 1.0 – 1.4 GeV.

There may also be a contribution from $f_0(1370)$, $f_0(1500)$, and $f_0(1710)$.

For CDF conditions, the f_2 -to-background ratio is about a factor of 2.

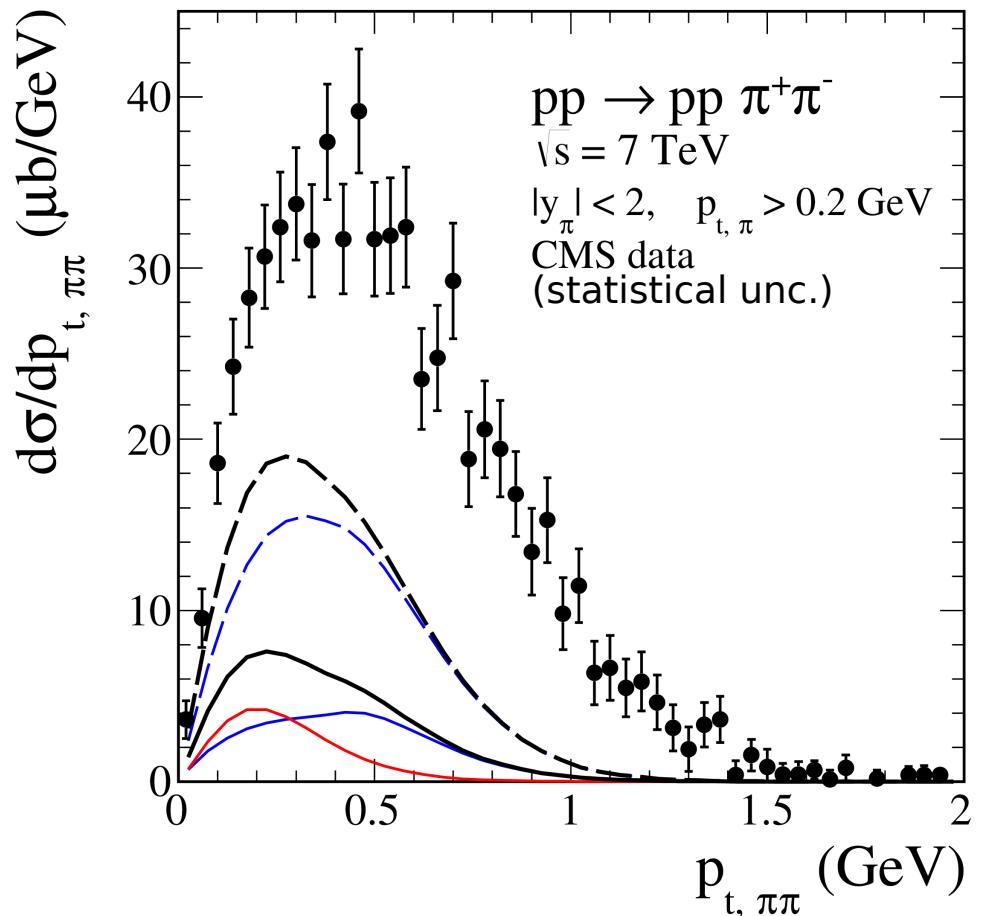

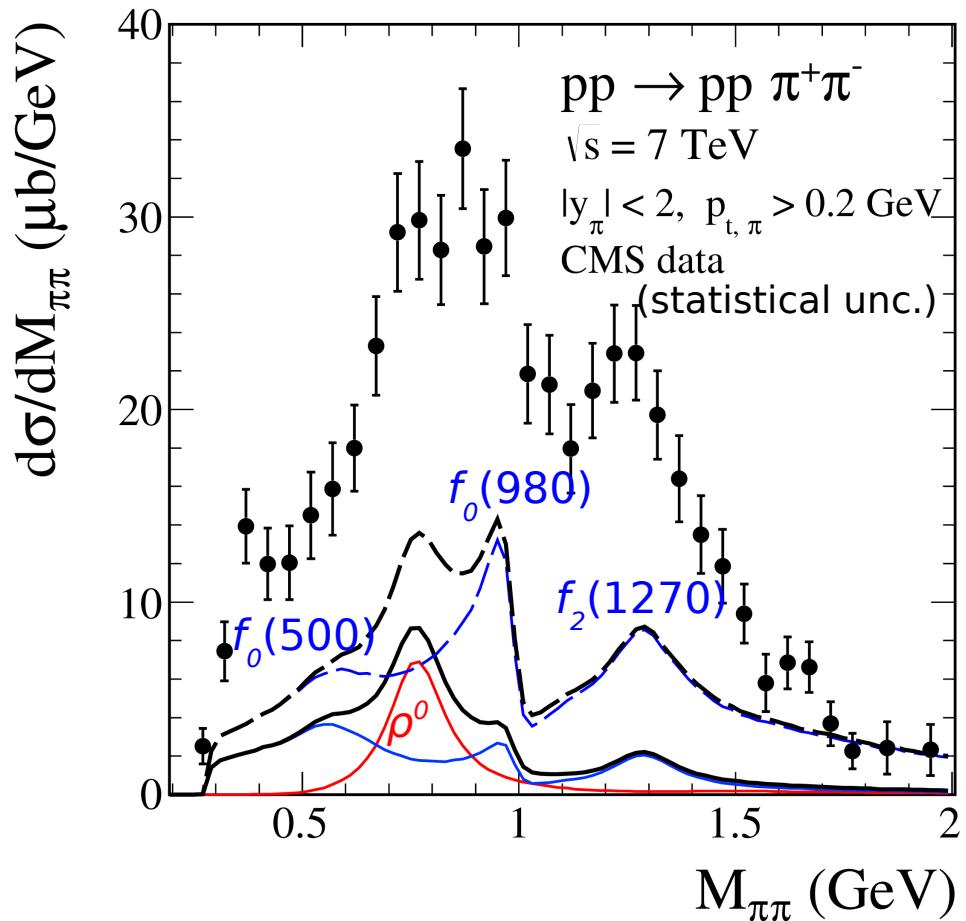

We take the monopole form for off-shell pion form factors with $\Lambda_{\text{off},M} = 0.7$ GeV.

Absorption effects were included:

$$\frac{d\sigma}{dM_{\pi\pi}} = \frac{d\sigma^{\text{Born}}}{dM_{\pi\pi}} \times \langle S^2 \rangle, \quad \langle S^2 \rangle = 0.1$$

CDF data: T. A. Aaltonen et al., Phys.Rev. D91 (2015) 091101
→ see talk by Ch. Mesropian

Comparison with CMS preliminary data

In diff. continuum term: (solid blue line) $\Lambda_{\text{off},M} = 0.7 \text{ GeV}$ (the same couplings as for CDF predictions)
(dashed blue line) $\Lambda_{\text{off},M} = 1.2 \text{ GeV}$, and enhanced $f_0(980)$ and f_2 couplings

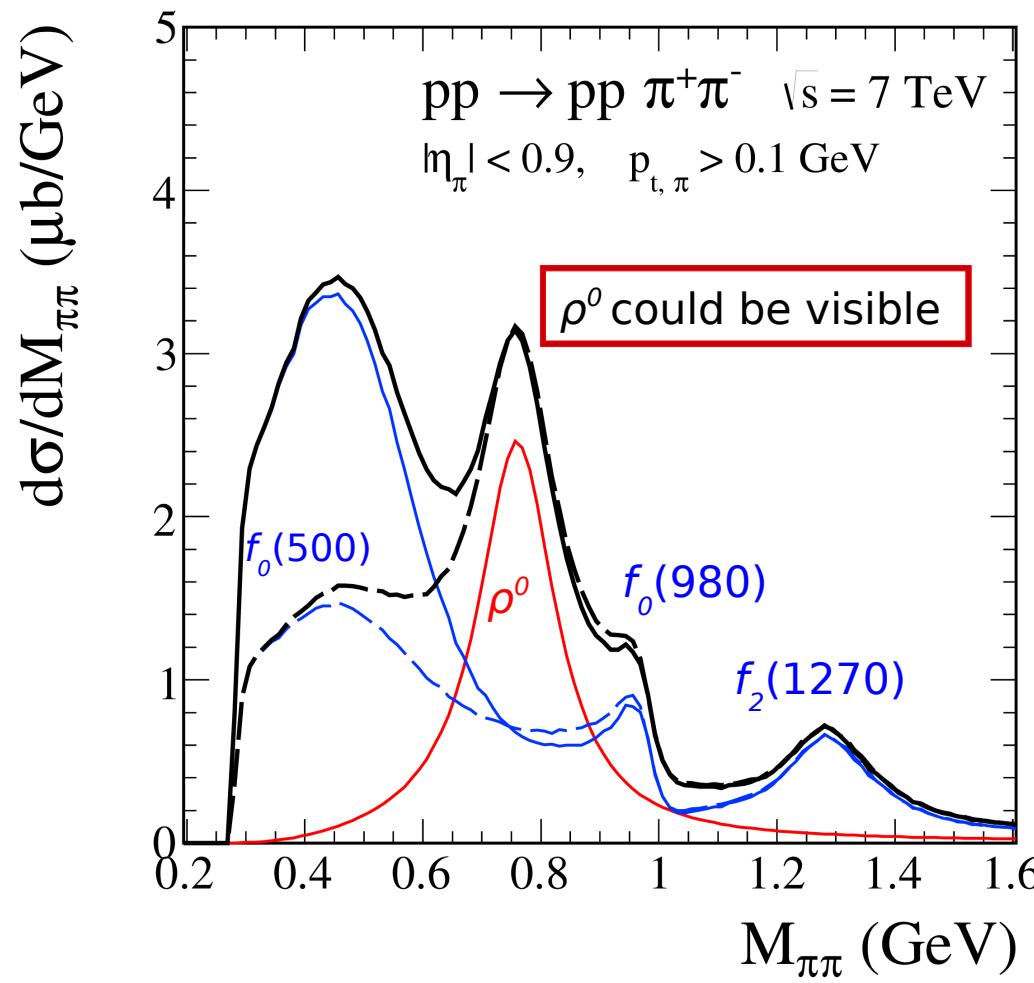

Our model results are much below the CMS data ([CMS-FSQ-12-004](#)) which could be due to a contamination of non-exclusive processes (one or both protons undergoing dissociation).

$\langle S^2 \rangle \simeq 0.1$ for the diffractive contribution

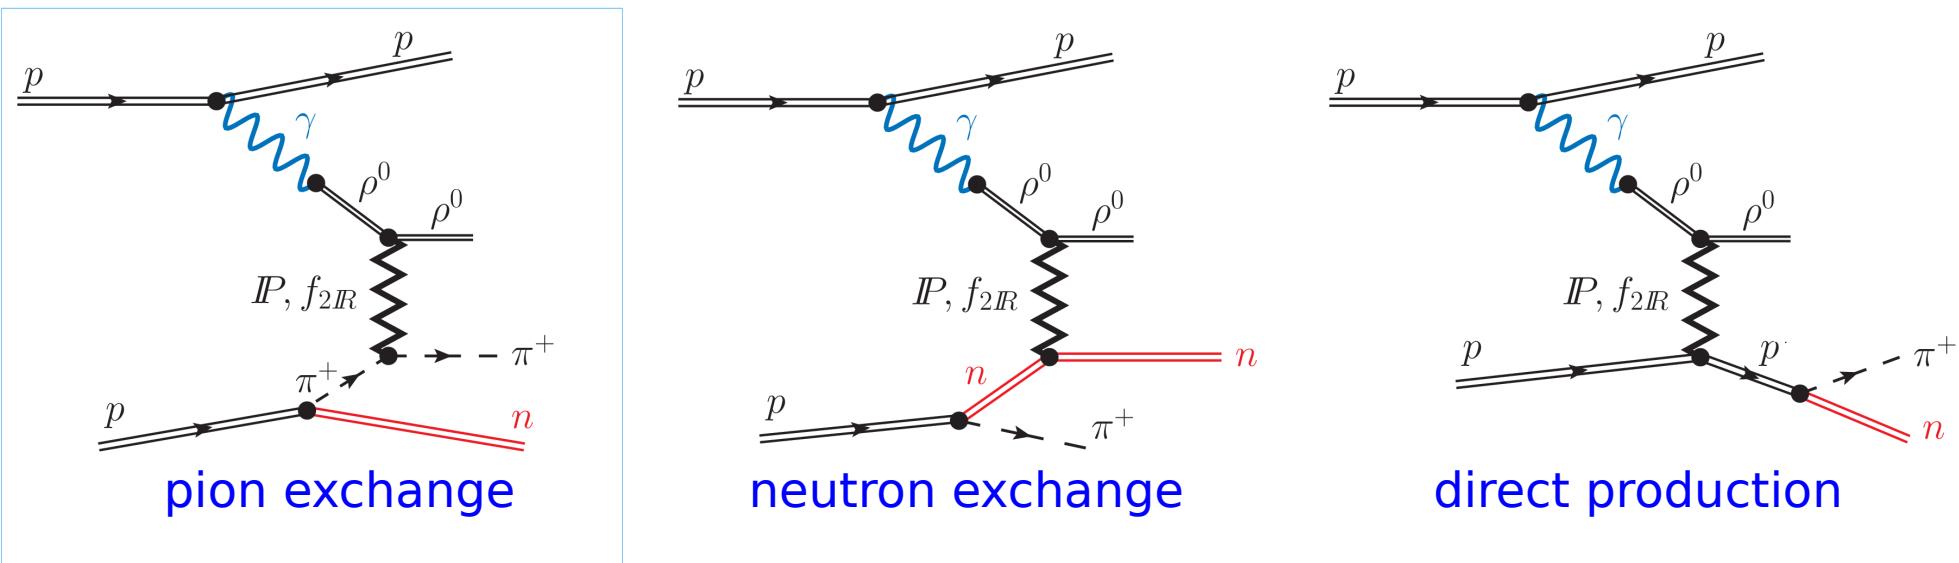

$\langle S^2 \rangle \simeq 0.9$ for the photon-IP/IR contribution

ρ^0 could be visible

Predictions for ALICE

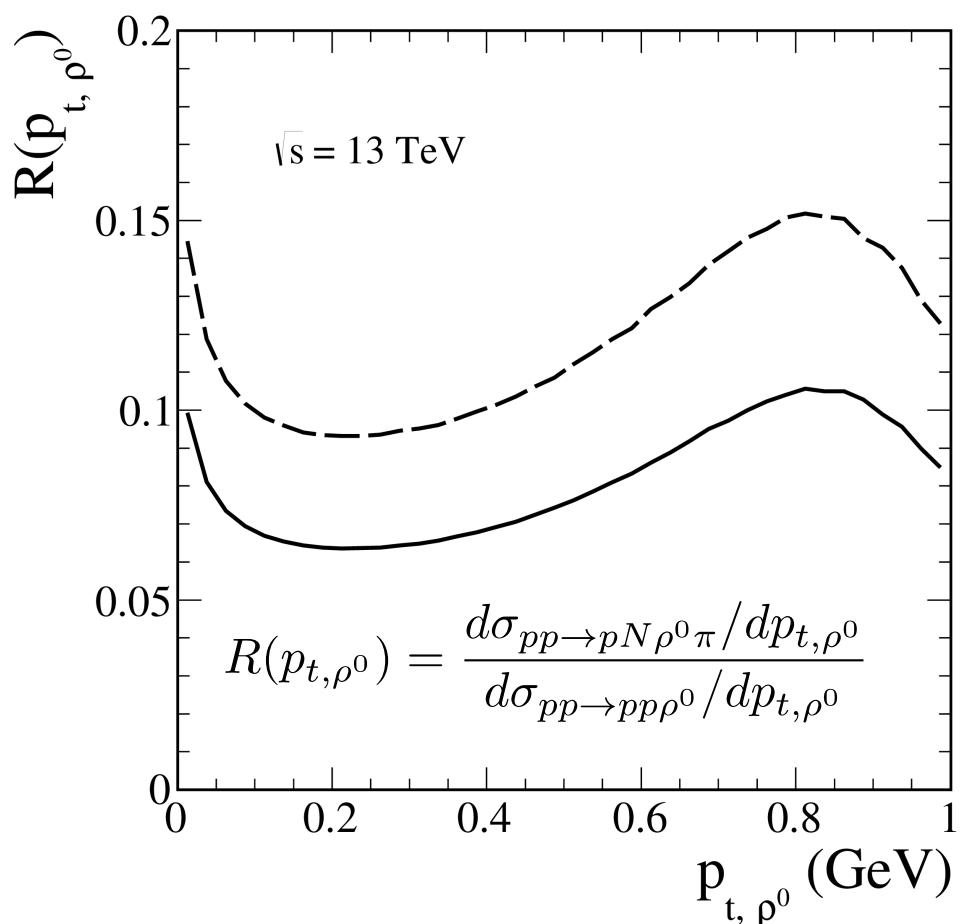

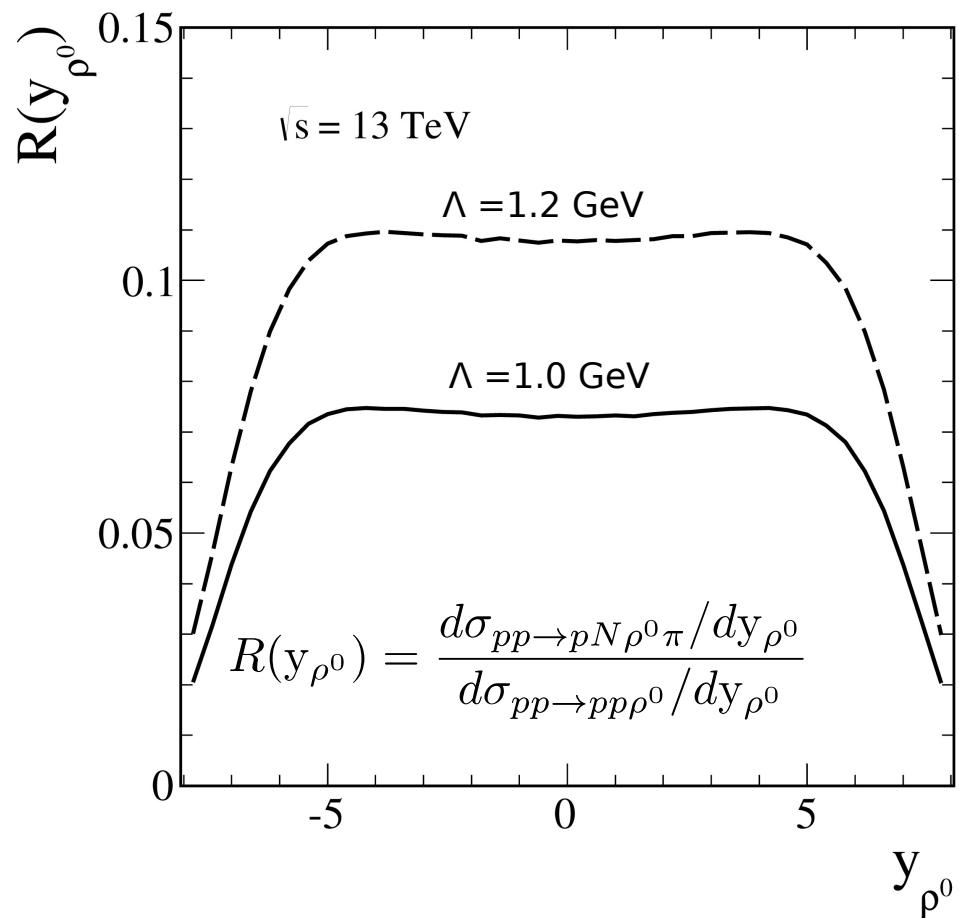

$$pp \rightarrow p \rho^0 (\pi^+ n)$$

- Motivated by the study of diffractive π^0 -strahlung in $pp \rightarrow pp\pi^0$ process (Drell-Hiida-Deck model) we consider here only contributions related to the diffractive $p \rightarrow \pi N$ transition. At large s and small $|t|$ in $p-n$ vertex the pion exchange contribution dominates.
see P. L., A. Szczurek, Phys. Rev. D87 (2013) 074037
- There are also resonance contributions due to diffractive excitation of resonances, N^* states, and their subsequent decays into the πN channel.
see L. Jenkovszky. et al., Phys. Atom. Nucl. 77, Phys. Rev. D83 (2011) 056014
- The $pp \rightarrow pN\rho^0\pi$ processes constitutes inelastic (non-exclusive) background to the $pp \rightarrow ppp^0$ reaction in the case when final state protons are not measured and only rapidity gap conditions are checked experimentally.
- The $\gamma p \rightarrow \rho^0 n \pi^+$ process was studied recently at HERA in ep collisions
V. Andreev et al. (H1 Collaboration), Eur. Phys. J C76 (2016) 41

*How large are discussed “inelastic” processes
 $pp \rightarrow pnp^0\pi^+$ and $pp \rightarrow ppp^0\pi^0$ compared to “elastic” $pp \rightarrow ppp^0$ process ?*

The single proton diffractive dissociation in the $pp \rightarrow pp^0\pi N$ processes constitute an important inelastic (non-exclusive) background ($\sim 7\text{-}10\%$) to the reference (exclusive) $pp \rightarrow pp^0p$ process at LHC energies.

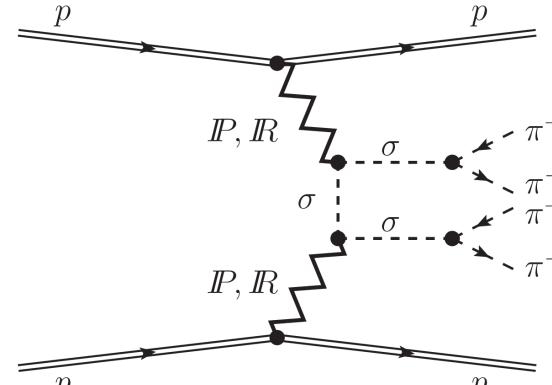

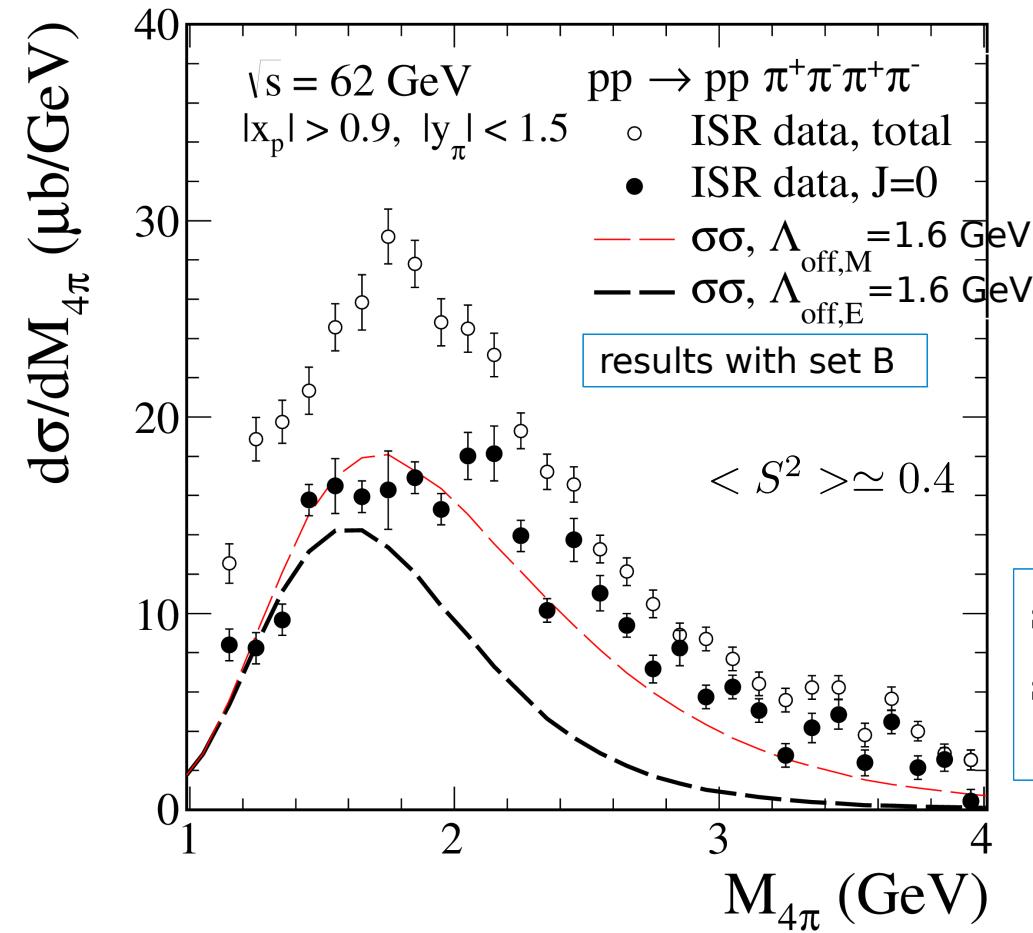

$$\sigma_{inel}/\sigma_{el} \approx (3/2 \times 0.46 \mu b)/10.32 \mu b \approx 0.07 \quad \text{for } \Lambda = 1 \text{ GeV}$$

$$\sigma_{inel}/\sigma_{el} \approx 1.02 \mu b/10.32 \mu b \approx 0.1 \quad \text{for } \Lambda = 1.2 \text{ GeV}$$

Diffractive production of $\pi^+\pi^-\pi^+\pi^-$

$$\sigma_{2 \rightarrow 6} = \int_{2m_\pi}^{\max\{m_{X_3}\}} \int_{2m_\pi}^{\max\{m_{X_4}\}} \sigma_{2 \rightarrow 4}(\dots, m_{X_3}, m_{X_4}) f_M(m_{X_3}) f_M(m_{X_4}) dm_{X_3} dm_{X_4}$$

with the spectral functions of meson $f_M(m_{X_i}) = A_N \left(1 - \frac{4m_\pi^2}{m_{X_i}^2}\right)^{n/2} \frac{\frac{2}{\pi} m_M^2 \Gamma_{M,tot}}{(m_{X_i}^2 - m_M^2)^2 + m_M^2 \Gamma_{M,tot}^2}$

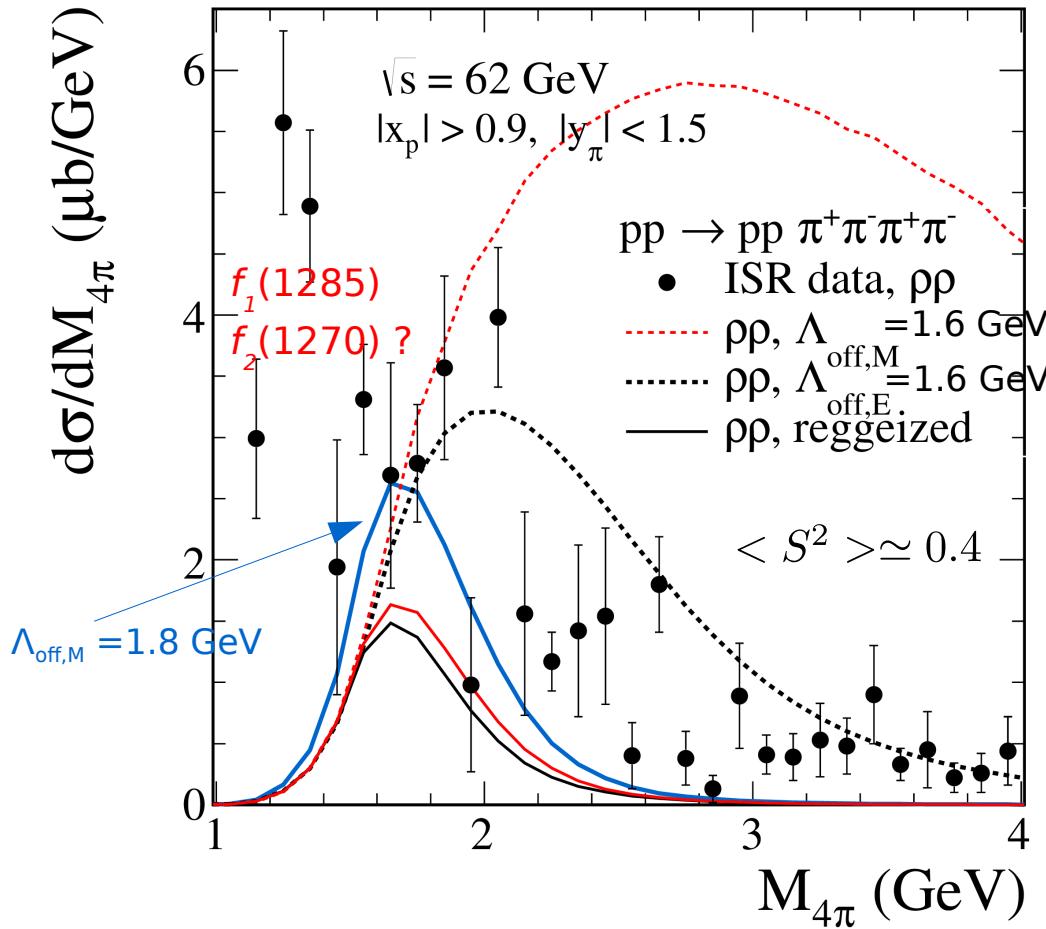

set A : $\beta_{IP\sigma\sigma} = 2\beta_{IP\pi\pi}, g_{f_2IR\sigma\sigma} = g_{f_2IR\pi\pi}$
set B : $\beta_{IP\sigma\sigma} = 2 \times (2\beta_{IP\pi\pi}), g_{f_2IR\sigma\sigma} = 2 \times g_{f_2IR\pi\pi}$
enhanced coupling constants

The 4π ISR data contains a large $\rho^0\pi^+\pi^-$ component with an enhancement in the $J = 2$ term interpreted by ABCDHW Collaboration as a $f_2(1720)$ state.

ISR data: A. Breakstone *et al.* (ABCDHW Collaboration), Z. Phys. C58 (1993) 251

4π production ($\rho\rho$ contribution)

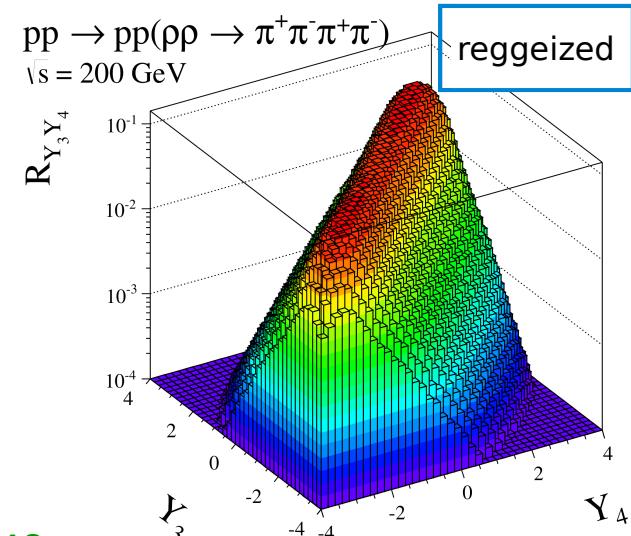

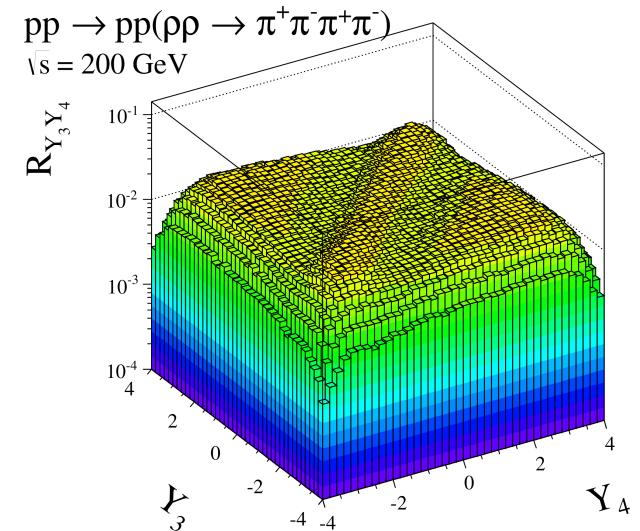

becomes crucial when the separation in rapidity between two ρ mesons increases $|Y_3 - Y_4| > 0$

$$R_{Y_3 Y_4} = \frac{d^2 \sigma}{dY_3 dY_4} / \int dY_3 dY_4 \frac{d^2 \sigma}{dY_3 dY_4}$$

Cross sections (in μb) for $pp \rightarrow pp \pi^+\pi^-\pi^+\pi^-$

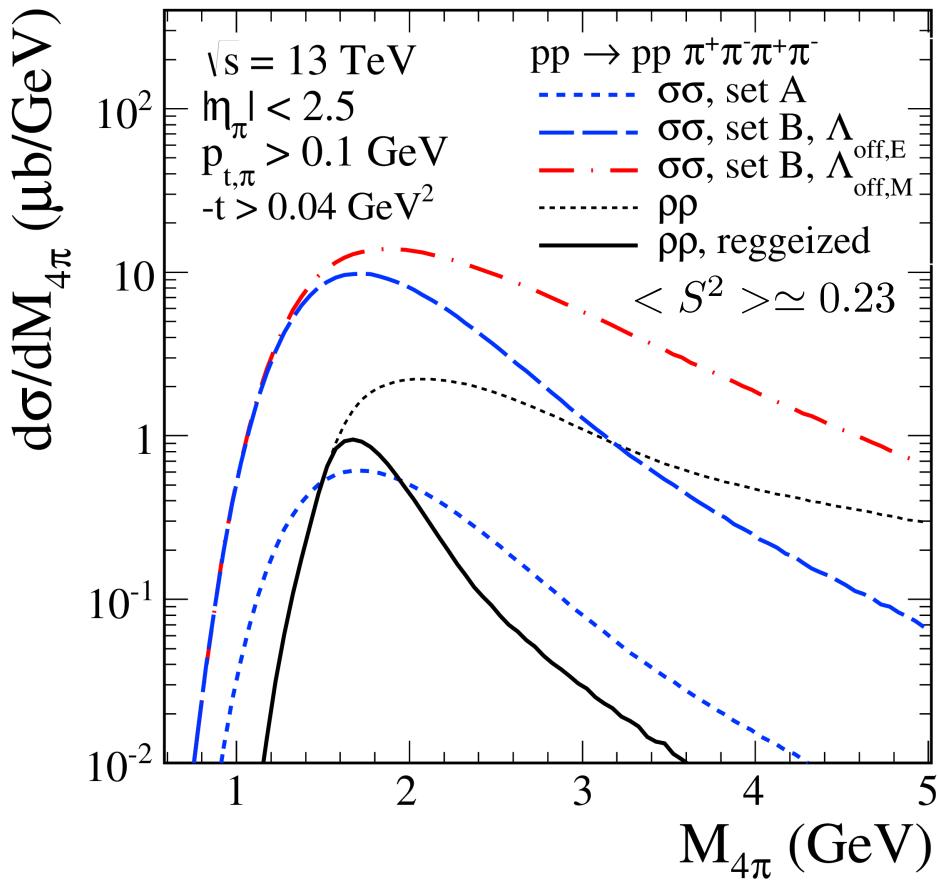

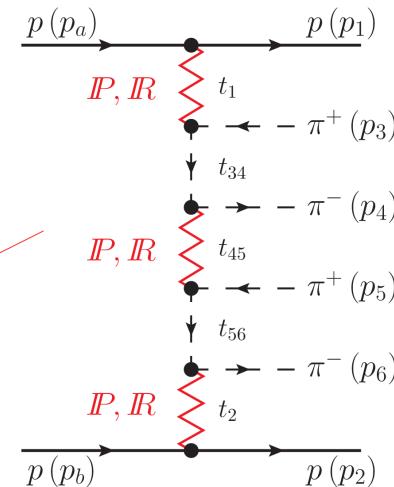

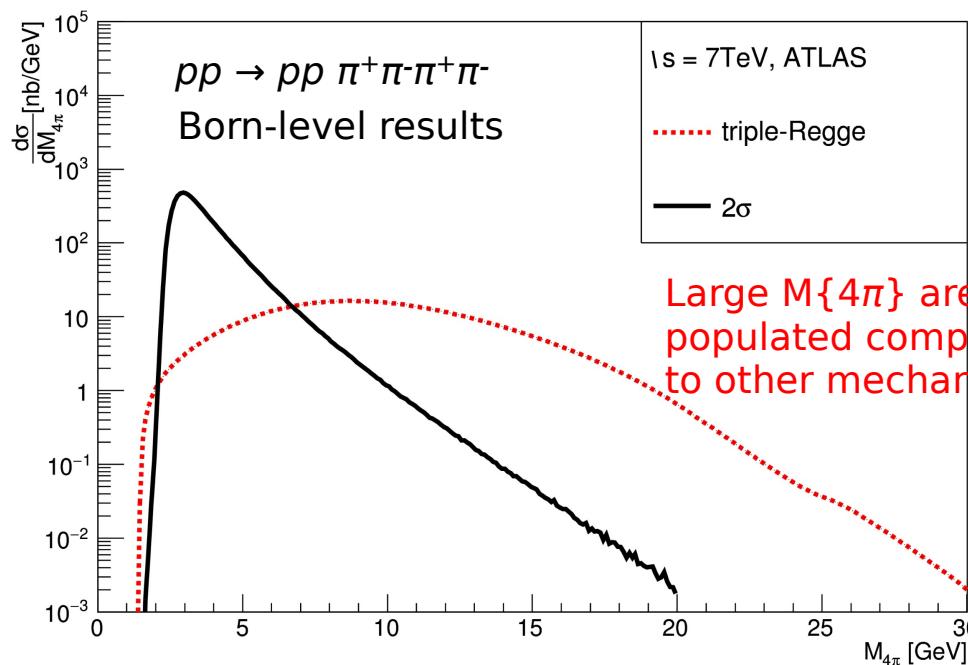

Table: Born cross sections in μb .
The $\sigma\sigma$ contribution was calculated with the enhanced (set B) couplings.
Results for the $\rho\rho$ contribution without and with (in the parentheses) inclusion of ρ -reggeization.

Predicted cross section can be obtained by multiplying the Born cross section by the gap survival factor:
0.3 (STAR), 0.21 (7 TeV),
0.19 (13 TeV), 0.23 (13 TeV, with cuts on $|t|$).

\sqrt{s} , TeV	Cuts
0.2	$ \eta_\pi < 1$, $p_{t,\pi} > 0.15 \text{ GeV}$, $0.03 < -t < 0.3 \text{ GeV}^2$
7	$ \eta_\pi < 0.9$, $p_{t,\pi} > 0.1 \text{ GeV}$
7	$ \eta_\pi < 2$, $p_{t,\pi} > 0.2 \text{ GeV}$
13	$ \eta_\pi < 1$, $p_{t,\pi} > 0.1 \text{ GeV}$
13	$ \eta_\pi < 2.5$, $p_{t,\pi} > 0.1 \text{ GeV}$
13	$ \eta_\pi < 2.5$, $p_{t,\pi} > 0.1 \text{ GeV}$, $-t > 0.04 \text{ GeV}^2$

“Born level” cross sections in μb	
$\sigma\sigma$ (set B)	$\rho\rho$
2.94	0.88 (0.17)
10.40	2.79 (0.53)
34.88	17.94 (2.20)
16.18	3.56 (0.72)
120.06	45.58 (6.21)
47.52	18.08 (2.44)

Triple Regge exchange mechanism of 4π continuum

R. Kycia, P. L., A. Szczerba and J. Turnau,
Phys. Rev. D95 (2017) 094020

- Calculation of triple Regge exchange mechanism is performed with GenEx MC.
- Large cross section is found at the LHC ($1-5 \mu b$, whole phase space, with absorption effects of order of 0.1)
- We consider the case of ATLAS and ALICE cuts.
The ATLAS (or CMS) has better chances to identify the triple-Regge exchange processes.

→ see talk by R. Kycia

For $|y\{\pi\}| < 2.5$, $p_{t,\pi} > 0.5 \text{ GeV}$ and at c.m energies of 7 - 13 TeV, we obtained $\sigma = 141 - 154 \text{ nb}$, respectively, neglecting absorption effects.

Conclusions

- The tensor-pomeron model was applied to many reactions.
The amplitudes are formulated in terms of effective vertices and propagators respecting the standard crossing and charge conjugation relations of QFT.
- We have given a consistence treatment of the $\pi^+\pi^-$ continuum and resonance production in proton-(anti)proton collisions.

The distribution in dipion invariant mass shows a rich pattern of structure that depends on the cuts used in a particular experiment.

We find that the relative contribution of the $f_2(1270)$ and $\pi\pi$ -continuum strongly depends on the cut on $|t|$ which may explain some controversial observation made by the ISR groups.

By assuming dominance of one of the $IP\text{-}IP\text{-}f_2$ couplings ($j=2$) we can get only a rough description of the recent CDF and preliminary STAR data.
Disagreement with the preliminary CMS data could be due to a large dissociation contribution.
Purely exclusive data expected from STAR, CMS+TOTEM and ATLAS+ALFA will allow us to draw definite conclusions. → see poster by R. Sikora

- The single proton diffractive dissociation in the $pp \rightarrow pp^0\pi N$ processes constitute an important inelastic (non-exclusive) background ($\sim 7\text{-}10\%$) to the reference (exclusive) $pp \rightarrow pp^0p$ process at LHC energies.
- We have estimated the cross sections for the process $pp \rightarrow pp \pi^+\pi^-\pi^+\pi^-$ via intermediate $\sigma\sigma$ and $\rho\rho$ states. A measurable cross section of few μb was obtained including the exp. cuts relevant for LHC experiments.
- In progress: GenEx MC generator for soft reactions within tensor pomeron approach

Extra slides

Pomeron-pomeron-meson couplings

l – orbital angular momentum

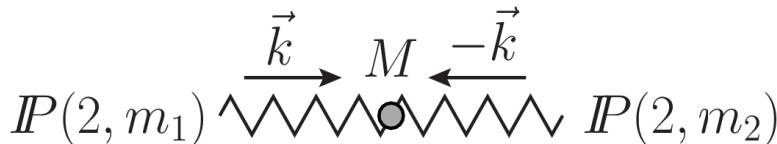

S – total spin, we have $S \in \{0, 1, 2, 3, 4\}$

J – total angular momentum (spin of the produced meson)

P – parity of meson

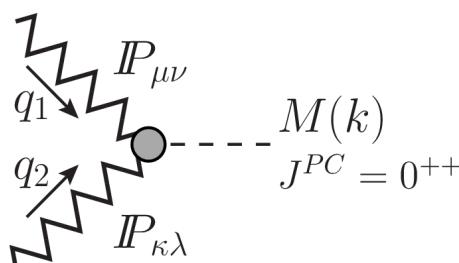

and Bose symmetry requires $l - S$ to be even

In table we list the values of J and P of mesons which can be produced in annihilation of two “spin 2 pomeron particles”

For each value of l , S , J , and P we can construct a covariant Lagrangian density \mathcal{L}' coupling the field operator for the meson M to the pomeron fields

and then we can obtain the “bare” vertices corresponding to the l and S .

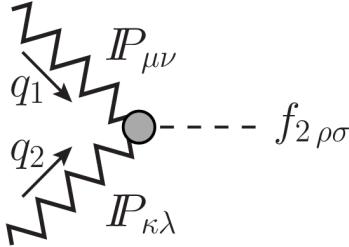

l	S	$ l - S \leq J \leq l + S$	$P = (-1)^l$
0	0	0	+
	2	2	
	4	4	
1	1	0, 1, 2	-
	3	2, 3, 4	
2	0	2	+
	2	0, 1, 2, 3, 4	
	4	2, 3, 4, 5, 6	
3	1	2, 3, 4	-
	3	0, 1, 2, 3, 4, 5, 6	
4	0	4	+
	2	2, 3, 4, 5, 6	
	4	0, 1, 2, 3, 4, 5, 6, 7, 8	
5	1	4, 5, 6	-
	3	2, 3, 4, 5, 6, 7, 8	
6	0	6	+
	2	4, 5, 6, 7, 8	
	4	2, 3, 4, 5, 6, 7, 8, 9, 10	

The lowest (l, S) term for a scalar meson $J^{PC} = 0^{++}$ is $(0, 0)$ while for a tensor meson $J^{PC} = 2^{++}$ is $(0, 2)$.

$\text{IP-IP-}f_2$ couplings

In order to write the corresponding formulae of vertices in a compact and convenient form we find it useful to define the tensor

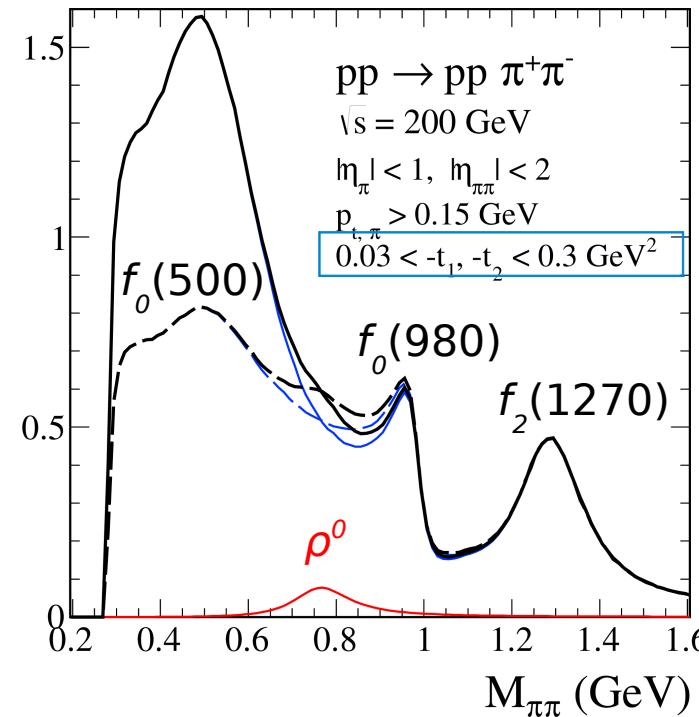

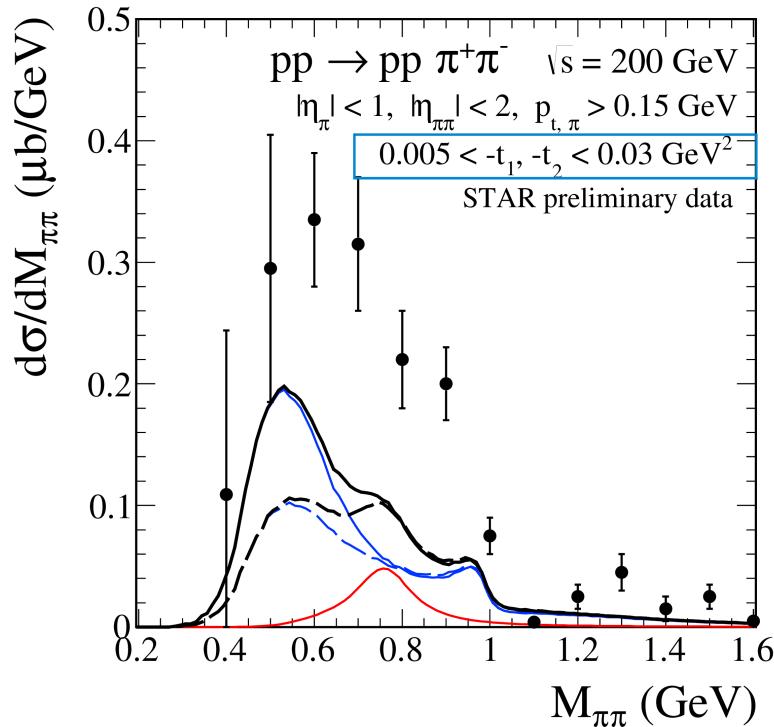

$$R_{\mu\nu\kappa\lambda} = \frac{1}{2}g_{\mu\kappa}g_{\nu\lambda} + \frac{1}{2}g_{\mu\lambda}g_{\nu\kappa} - \frac{1}{4}g_{\mu\nu}g_{\kappa\lambda}$$

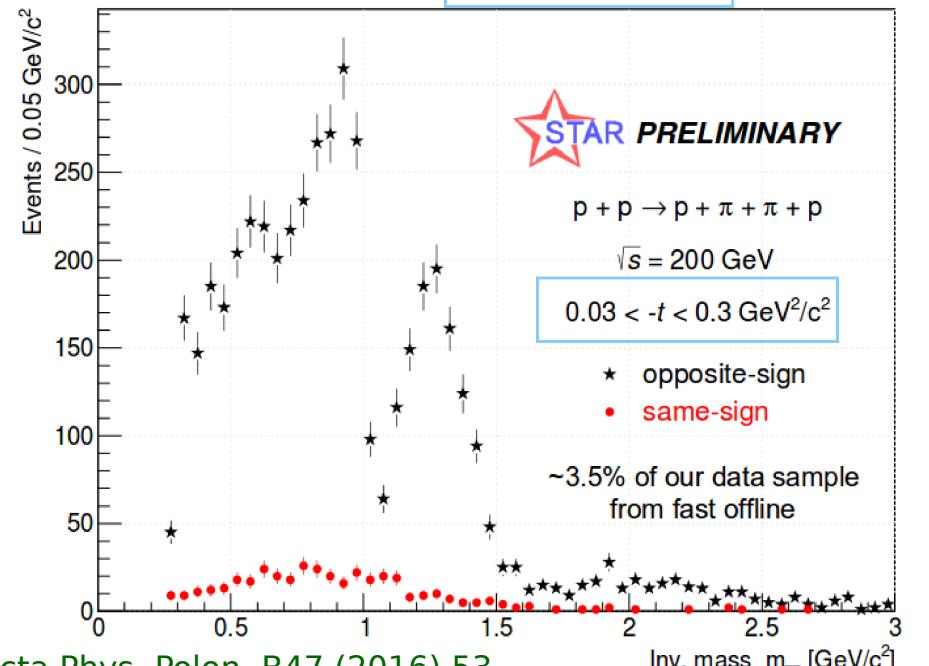

$$\begin{aligned}
i\Gamma_{\mu\nu,\kappa\lambda,\rho\sigma}^{(\text{IP-IP } f_2)(1)} &= 2i g_{\text{IP-IP } f_2}^{(1)} M_0 R_{\mu\nu\mu_1\nu_1} R_{\kappa\lambda\alpha_1\lambda_1} R_{\rho\sigma\rho_1\sigma_1} g^{\nu_1\alpha_1} g^{\lambda_1\rho_1} g^{\sigma_1\mu_1} \\
i\Gamma_{\mu\nu,\kappa\lambda,\rho\sigma}^{(\text{IP-IP } f_2)(2)}(q_1, q_2) &= -\frac{2i}{M_0} g_{\text{IP-IP } f_2}^{(2)} \left((q_1 \cdot q_2) R_{\mu\nu\rho_1\alpha} R_{\kappa\lambda\sigma_1^\alpha} - q_{1\rho_1} q_2^{\mu_1} R_{\mu\nu\mu_1\alpha} R_{\kappa\lambda\sigma_1^\alpha} \right. \\
&\quad \left. - q_1^{\mu_1} q_{2\sigma_1} R_{\mu\nu\rho_1\alpha} R_{\kappa\lambda\mu_1^\alpha} + q_{1\rho_1} q_{2\sigma_1} R_{\mu\nu\kappa\lambda} \right) R_{\rho\sigma}^{\rho_1\sigma_1} \\
i\Gamma_{\mu\nu,\kappa\lambda,\rho\sigma}^{(\text{IP-IP } f_2)(3)}(q_1, q_2) &= -\frac{2i}{M_0} g_{\text{IP-IP } f_2}^{(3)} \left((q_1 \cdot q_2) R_{\mu\nu\rho_1\alpha} R_{\kappa\lambda\sigma_1^\alpha} + q_{1\rho_1} q_2^{\mu_1} R_{\mu\nu\mu_1\alpha} R_{\kappa\lambda\sigma_1^\alpha} \right. \\
&\quad \left. + q_1^{\mu_1} q_{2\sigma_1} R_{\mu\nu\rho_1\alpha} R_{\kappa\lambda\mu_1^\alpha} + q_{1\rho_1} q_{2\sigma_1} R_{\mu\nu\kappa\lambda} \right) R_{\rho\sigma}^{\rho_1\sigma_1} \\
i\Gamma_{\mu\nu,\kappa\lambda,\rho\sigma}^{(\text{IP-IP } f_2)(4)}(q_1, q_2) &= -\frac{i}{M_0} g_{\text{IP-IP } f_2}^{(4)} \left(q_1^{\alpha_1} q_2^{\mu_1} R_{\mu\nu\mu_1\nu_1} R_{\kappa\lambda\alpha_1\lambda_1} + q_2^{\alpha_1} q_1^{\mu_1} R_{\mu\nu\alpha_1\lambda_1} R_{\kappa\lambda\mu_1\nu_1} \right) R^{\nu_1\lambda_1}_{\rho\sigma} \\
i\Gamma_{\mu\nu,\kappa\lambda,\rho\sigma}^{(\text{IP-IP } f_2)(5)}(q_1, q_2) &= -\frac{2i}{M_0^3} g_{\text{IP-IP } f_2}^{(5)} \left(q_1^{\mu_1} q_2^{\nu_1} R_{\mu\nu\nu_1\alpha} R_{\kappa\lambda\mu_1^\alpha} + q_1^{\nu_1} q_2^{\mu_1} R_{\mu\nu\mu_1\alpha} R_{\kappa\lambda\nu_1^\alpha} \right. \\
&\quad \left. - 2(q_1 \cdot q_2) R_{\mu\nu\kappa\lambda} \right) q_{1\alpha_1} q_{2\lambda_1} R^{\alpha_1\lambda_1}_{\rho\sigma} \\
i\Gamma_{\mu\nu,\kappa\lambda,\rho\sigma}^{(\text{IP-IP } f_2)(6)}(q_1, q_2) &= \frac{i}{M_0^3} g_{\text{IP-IP } f_2}^{(6)} \left(q_1^{\alpha_1} q_1^{\lambda_1} q_2^{\mu_1} q_{2\rho_1} R_{\mu\nu\mu_1\nu_1} R_{\kappa\lambda\alpha_1\lambda_1} \right. \\
&\quad \left. + q_2^{\alpha_1} q_2^{\lambda_1} q_1^{\mu_1} q_{1\rho_1} R_{\mu\nu\alpha_1\lambda_1} R_{\kappa\lambda\mu_1\nu_1} \right) R^{\nu_1\rho_1}_{\rho\sigma} \\
i\Gamma_{\mu\nu,\kappa\lambda,\rho\sigma}^{(\text{IP-IP } f_2)(7)}(q_1, q_2) &= -\frac{2i}{M_0^5} g_{\text{IP-IP } f_2}^{(7)} q_1^{\rho_1} q_1^{\alpha_1} q_1^{\lambda_1} q_2^{\sigma_1} q_2^{\mu_1} q_2^{\nu_1} R_{\mu\nu\mu_1\nu_1} R_{\kappa\lambda\alpha_1\lambda_1} R_{\rho\sigma\rho_1\sigma_1}
\end{aligned}$$

We can associate the couplings $j = 1, \dots, 7$ with the following (l, S) values:
 $(0, 2), (2, 0) - (2, 2), (2, 0) + (2, 2), (2, 4), (4, 2), (4, 4), (6, 4)$, respectively.

Comparison with STAR preliminary data

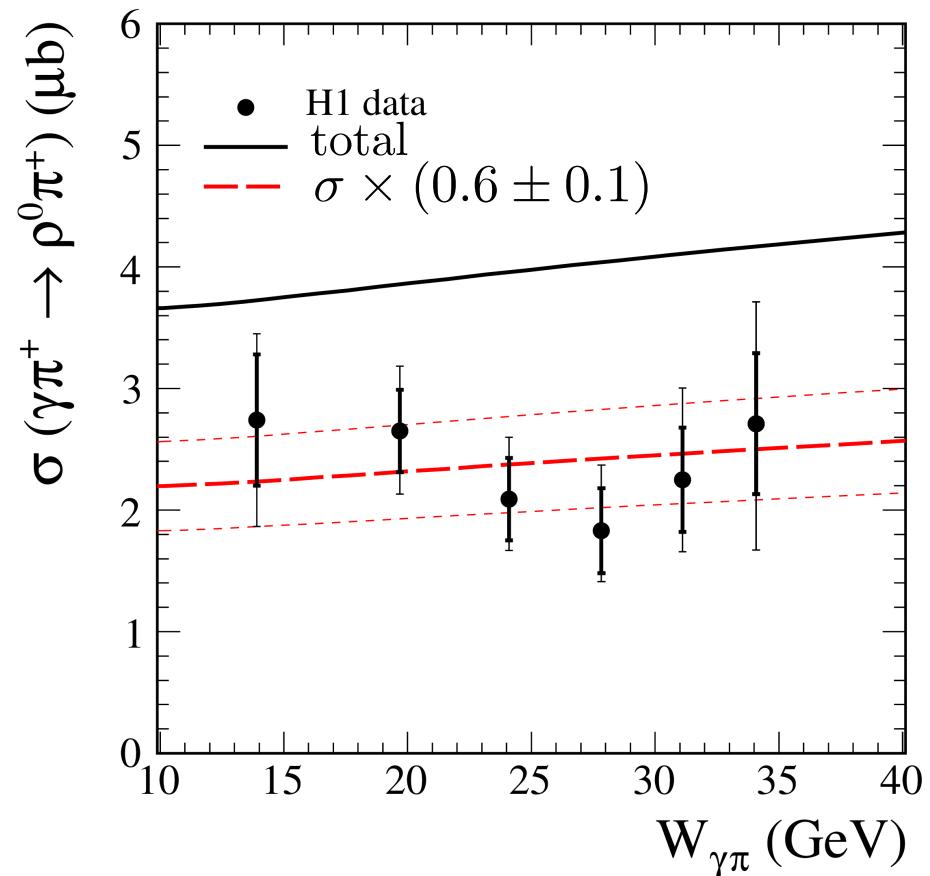

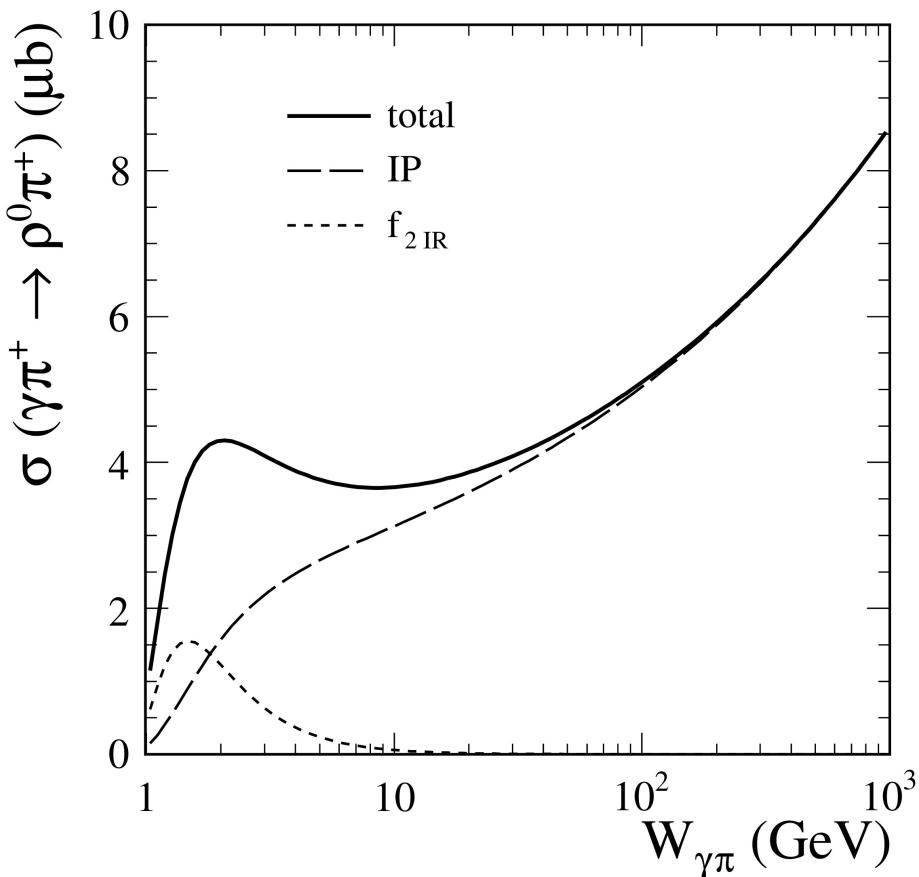

- Blue lines (diffractive term), red line ($ρ^0$ term), black lines (complete result)
- In calculation of f_2 term only one of the $IP-IP-f_2$ couplings ($j=2$) was taken
- At $M_{ππ} < 1$ GeV also other processes may be important
 $\rightarrow \pi\pi$ FSI effect ($f_0(500)$ meson)
- Absorption effects were included effectively:
 $\langle S^2 \rangle \simeq 0.2$ for the diffractive contribution
 $\langle S^2 \rangle \simeq 0.9$ for the photon-IP/IR contribution

$\gamma\pi^+ \rightarrow \rho^0\pi^+$

- The $\gamma p \rightarrow \rho^0 n \pi^+$ process was studied recently at HERA

V. Andreev et al. (H1 Collaboration), Eur. Phys. J C76 (2016) 41

- From a measurement of $pp \rightarrow p \rho^0 \pi N$ one would be able to extract the cross section, total and differential, for $\gamma\pi \rightarrow \rho^0\pi$.

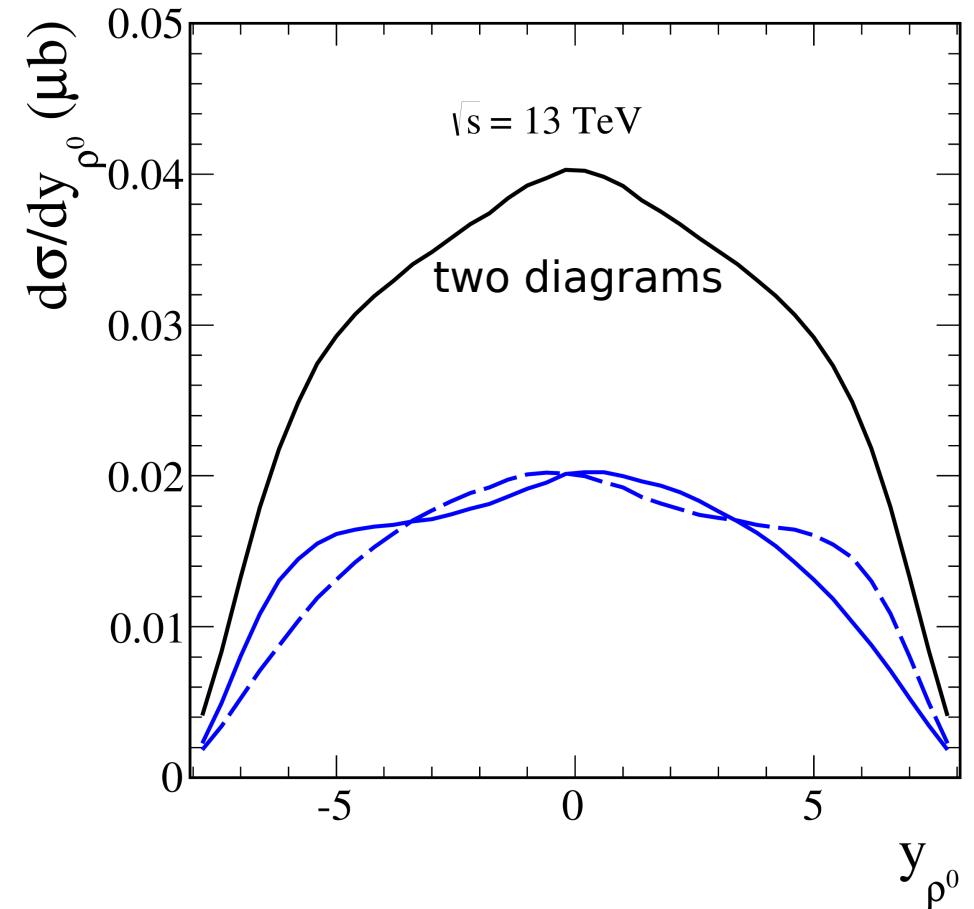

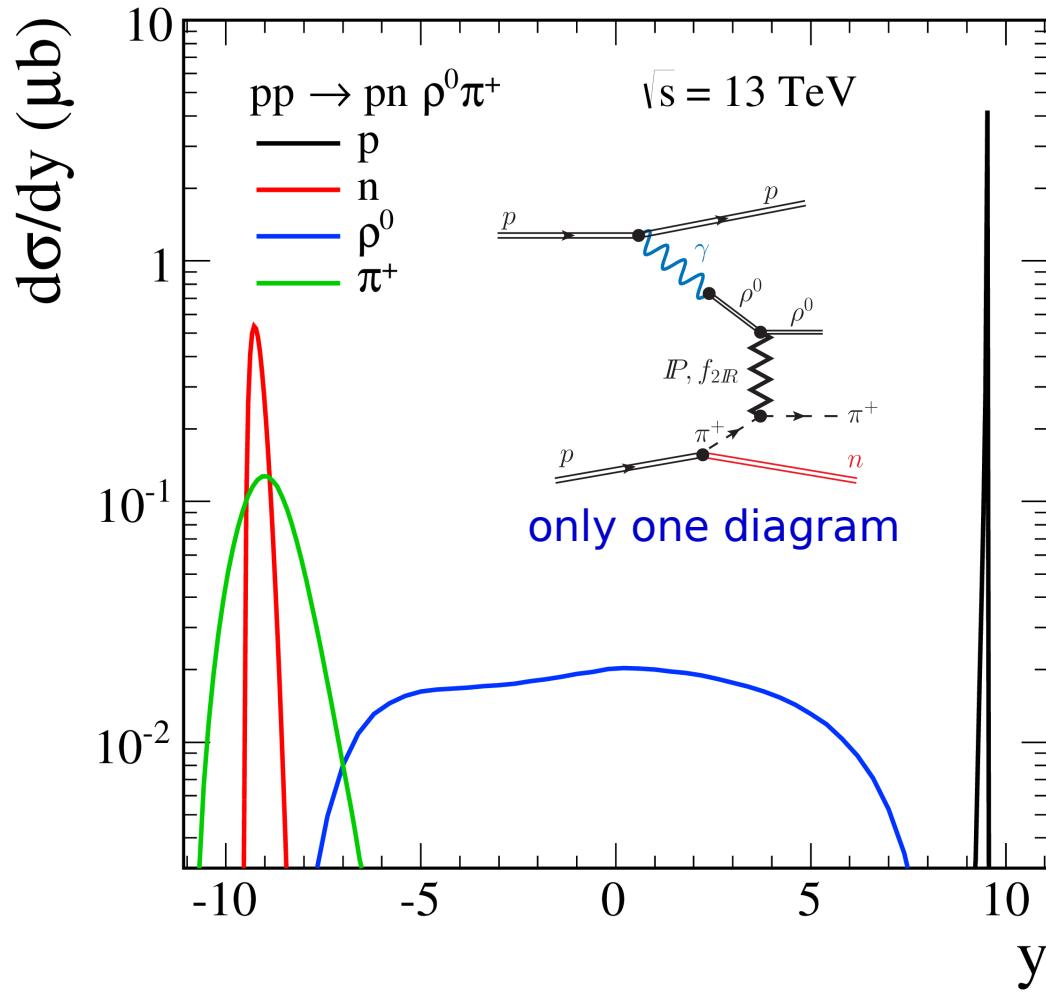

For the LHC one could cover a much broader range of $W\{\gamma\pi\}$ but the experimental extraction of the $\gamma\pi \rightarrow \rho^0\pi$ cross sections is certainly not easy.

$pp \rightarrow pn\rho^0\pi^+$

We have estimated first predictions within the tensor pomeron framework.

We take into account only diagram with the pion exchange.

No absorption effects were included.

Due to specificity of the reaction the corresponding amplitudes do not interfere as some of the particles in the final state are emitted in different hemispheres (exclusively forward or backward) for the two amplitudes (mechanisms).
