

# Status and Progress of the International Axion Observatory

Esther Ferrer Ribas

IRFU, CEA-Saclay

MADMAX meeting, Jussieu, Paris, 10 May 2017

# IAXO: International AXion Observatory

- Baseline search: **solar axions**
- Why are we looking for axions?
  - Most elegant solution to explain the apparent symmetry between matter and anti-matter in the strong interactions (CP violation);
  - Predicted by SM extensions, neutral, very light, low interacting cross-section;
  - Dark matter candidates;
  - Astrophysical hints for axion/ALPs?
    - Transparency of the Universe to UHE gammas;
    - Anomalous cooling of different types of stars;
  - Relevant axion/ALP parameter space at reach of current and near-future experiments;
  - Still too little experimental effort devoted to axions when compared to WIMP;

# Search strategies

Axions couple to photons in the presence of a magnetic field in all models.

- Relic Axions
  - Axions that are part of galactic dark matter halo:
    - Axion Haloscopes (ADMX)
- Solar Axions
  - Emitted by the solar core.
    - Axion Helioscopes (**CAST** → **IAXO**)
    - Crystals
- Axions in the laboratory
  - “Light shining through wall” experiments

# Helioscope Physics

*Sikivie, Phys. Rev. Lett 51 (1983)*

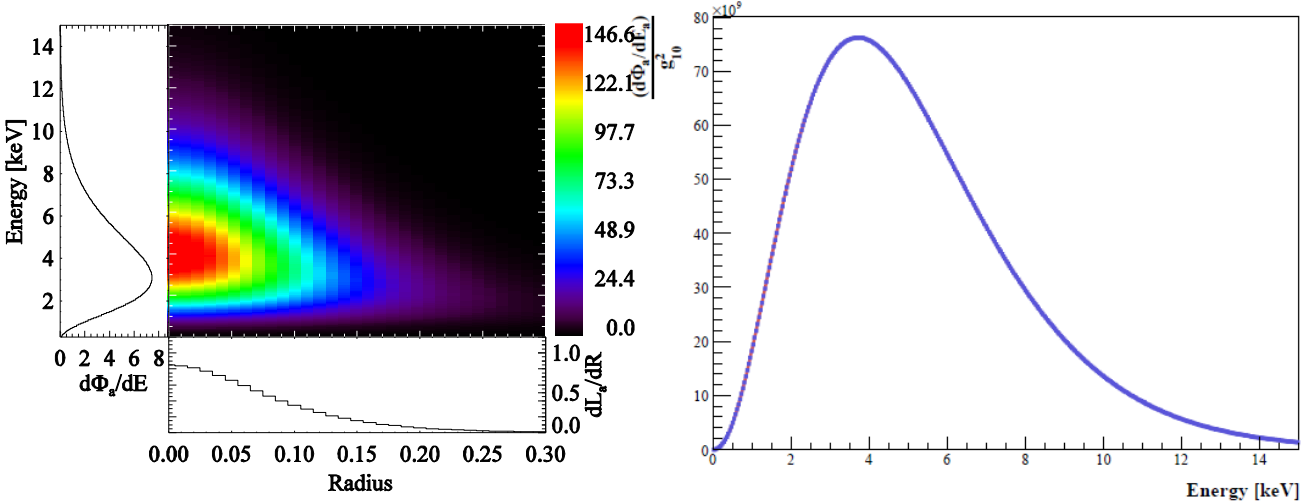

### Production in the Sun

Conversion of thermal photons into axions via Primakoff effect in the solar core

### Detection in the helioscope

Conversion of axions into photons via the inverse Primakoff effect in a strong magnetic field

Expected number of photons:

$$N_\gamma = \Phi_a \cdot A \cdot P_{a \rightarrow \gamma}$$

$$P_{a \rightarrow \gamma} = 1.7 \times 10^{-17} \left( \frac{B \cdot L}{9.0T \cdot 9.3m} \right)^2 \left( \frac{g_{a\gamma}}{10^{-10} \text{GeV}^{-1}} \right)^2$$

≈ 0.3 evts/hour

with  $g_{a\gamma} = 10^{-10} \text{ GeV}^{-1}$  and  $A = 14 \text{ cm}^2$

# CAST: CERN Axion Solar Telescope

LHC dipôle : L = 9 m, B = 9 T

Rotating platform to follow the sun

2003 – 2004	CAST phase I: vacuum in the magnet bores
2006	CAST phase II - $^4\text{He}$ Run: axion masses explored up to 0.39 eV (160 P-steps)
2007	$^3\text{He}$ Gas system implementation
2008 - 2011	CAST phase II - $^3\text{He}$ Run <ul style="list-style-type: none"> <li>• axion masses explored up to 1.17 eV</li> <li>• bridging the hot dark matter limit</li> </ul>
2012	•Revisit $^4\text{He}$ Run with improved detectors
2013-2015	•Revisit vacuum phase with improved detectors •Final QCD axion results

The axion has not been observed → limit on the coupling constant

Best world-wide limit for a wide range of masses

**CAST Coll, Nature Physics (2017) doi:10.1038/nphys4109**

# CAST Coll, Nature Physics (2017)

# IAXO concept

**Goal:** in terms of signal to background ratio 4-5 orders of magnitude more sensitive than CAST, which means sensitivity to axion-photon couplings down to a few  $\times 10^{-12} \text{ GeV}^{-1}$

$$g_{a\gamma}^4 \propto \underbrace{b^{1/2} \epsilon^{-1}}_{\text{detectors}} \times \underbrace{a^{1/2} \epsilon_o^{-1}}_{\text{optics}} \times \underbrace{(BL)^{-2} A^{-1}}_{\text{magnet}} \times \underbrace{t^{-1/2}}_{\text{exposure}}$$

**No technology challenge (built on CAST experience)**

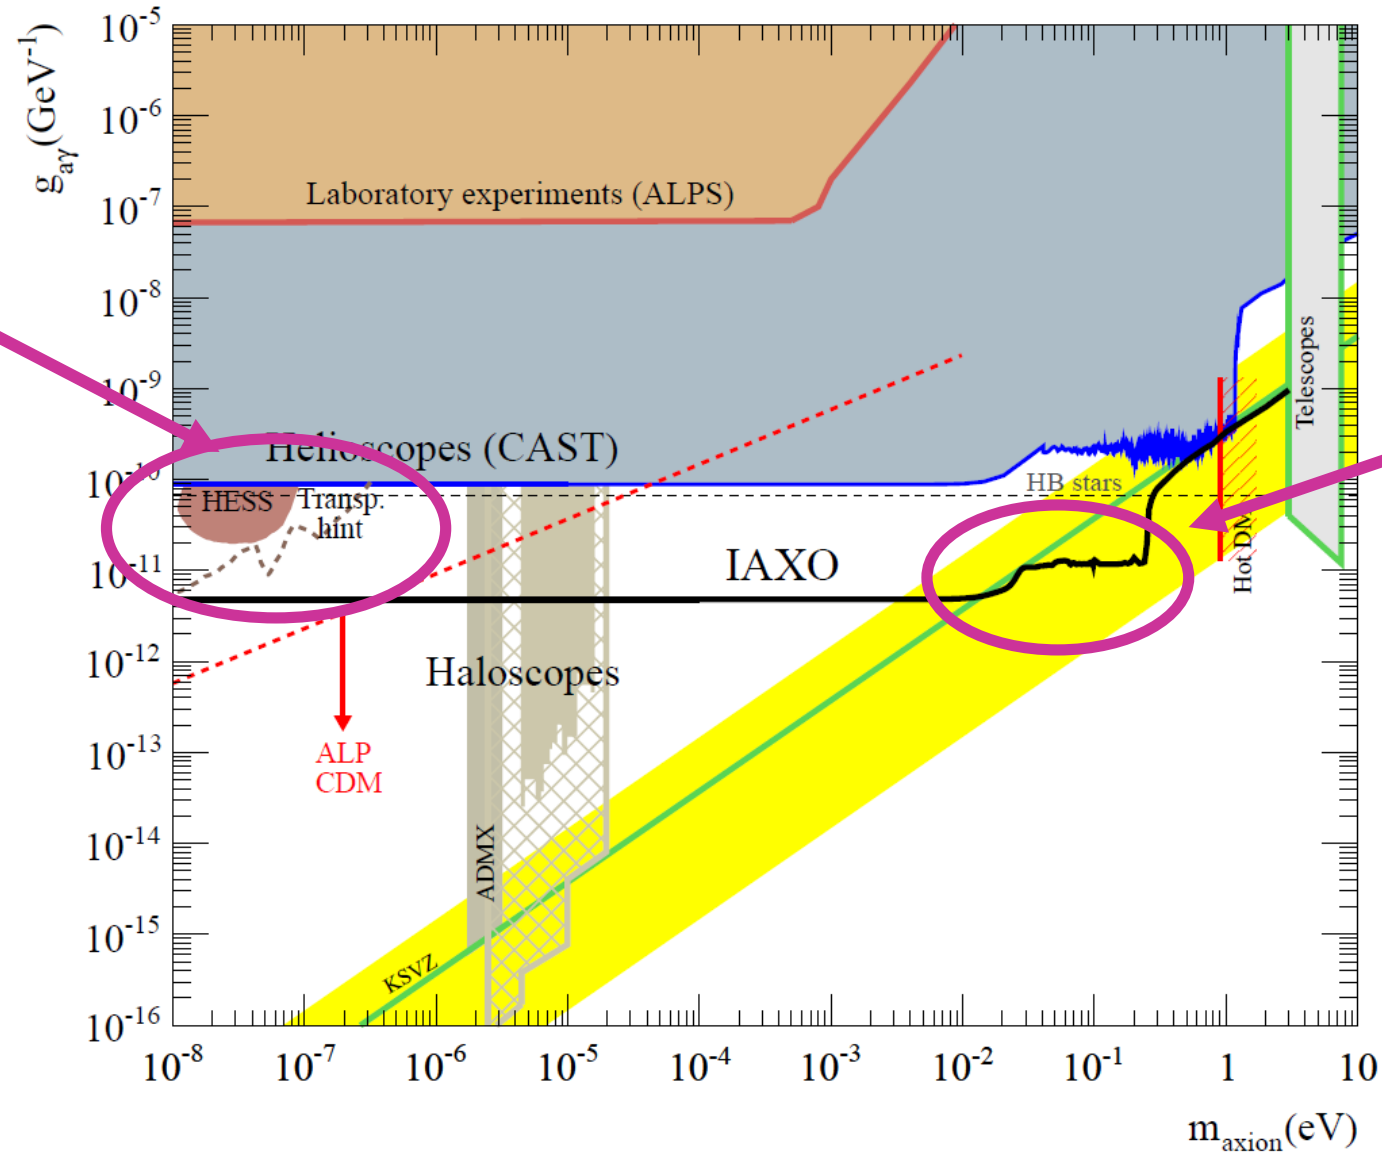

- ✓ New dedicated superconducting magnet
- ✓ Use of X-ray focalisation over  $\sim \text{m}^2$  area
- ✓ Low background detectors (improve bck by 1-2 orders of magnitude)

Optimised configuration: **TOROIDAL** with 8 bores  
 25 m long, 5 m diameter and a peak field of 5.4 T

Property	Value	
<b>Cryostat dimensions:</b>	Overall length (m)	25
	Outer diameter (m)	5.2
	Cryostat volume (m <sup>3</sup> )	~ 530
<b>Toroid size:</b>	Inner radius, $R_{in}$ (m)	1.0
	Outer radius, $R_{out}$ (m)	2.0
	Inner axial length (m)	21.0
	Outer axial length (m)	21.8
<b>Mass:</b>	Conductor (tons)	65
	Cold Mass (tons)	130
	Cryostat (tons)	35
	Total assembly (tons)	~ 250
	<b>Coils:</b>	Number of racetrack coils
Winding pack width (mm)		384
Winding pack height (mm)		144
Turns/coil		180
Nominal current, $I_{op}$ (kA)		12.0
Stored energy, $E$ (MJ)		500
Inductance (H)		6.9
Peak magnetic field, $B_p$ (T)		5.4
<b>Conductor:</b>	Average field in the bores (T)	2.5
	Overall size (mm <sup>2</sup> )	35 × 8
	Number of strands	40
	Strand diameter (mm)	1.3
	Critical current @ 5 T, $I_c$ (kA)	58
	Operating temperature, $T_{op}$ (K)	4.5
	Operational margin	40%
	Temperature margin @ 5.4 T (K)	1.9
<b>Heat Load:</b>	at 4.5 K (W)	~150
	at 60-80 K (kW)	~1.6

(ATLAS toroid 26 m long, 20 m diameter, peak field 3.9 T)

# IAXO x-ray optics

Each bore equipped with an X-ray optics  
8 systems of 600 mm diameter each

Specifications:

- Refined imaging not needed
- Need to cover large area (cost-effective)
- Good throughput (0.3-0.5)
- Small focal point ( $\sim 1 \text{ cm}^2$ )

*Jakobsen et al. Proc SPIE 8861:886113 (2013)*

Baseline : Use approach NASA's NUSTAR satellite

Telescopes	8
$N$ , Layers (or shells) per telescope	123
Segments per telescope	2172
Geometric area of glass per telescope	$0.38 \text{ m}^2$
Focal length	5.0 m
Inner radius	50 mm
Outer Radius	300 mm
Minimum graze angle	2.63 mrad
Maximum graze angle	15.0 mrad
Coatings	W/B <sub>4</sub> C multilayers
Pass band	1–10 keV
IAXO Nominal, 50% EEF (HPD)	0.29 mrad
IAXO Enhanced, 50% EEF (HPD)	0.23 mrad
IAXO Nominal, 80% EEF	0.58 mrad
IAXO Enhanced, 90% EEF	0.58 mrad
FOV	2.9 mrad

# IAXO low background detectors

Baseline: Micromegas detectors

Goal: below  $10^{-7}$  c/keV/s/cm<sup>2</sup>

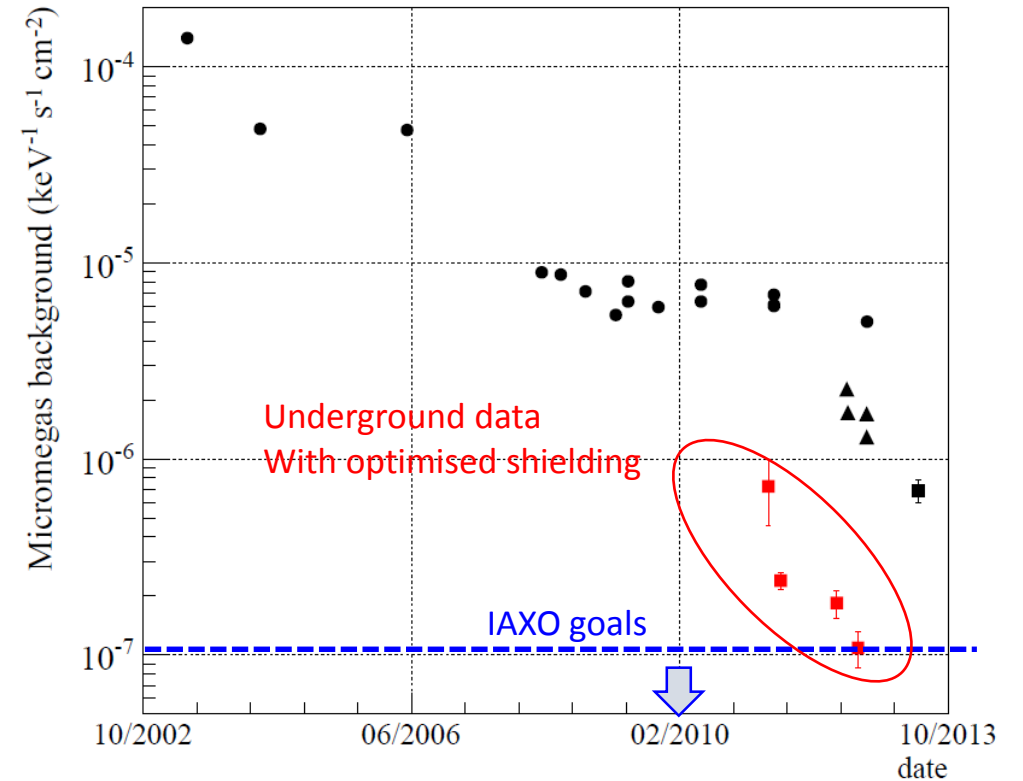

Key elements:

- Radiopure components
- Shielding
- Offline discrimination

IAXO Pathfinder system at CAST 2014-2015:

last generation of Microbulk detectors + optimised shielding + Xray telescope IAXO pathfinder → **CASTMM 2014 :  $0.85 \times 10^{-6}$  c/keV/s/cm<sup>2</sup>**

**S. Aune et al., JINST 9 (2014) 9 P01001**  
**F. Aznar et al., JCAP 12 (2015) 9 008**

Micromegas are the base-line for IAXO but additional technologies, **Ingrid Micromegas, TES, MMC, CCD** will also show their potential in the coming years

# IAXO status of project

- 2011: First studies *Irastorza et al. JCAP (2011) 1106:013*
- ASPERA/APPEC Roadmap acknowledges axion physics, CAST and recommends progress towards IAXO (C. Spiering Krakow 2012)
- IAXO is also present in US roadmapping (Snowmass and P5 process) (december 2013)
- 2013: Conceptual Design: *Armengaud et al. JINST 9 (2014) T05002*
- August 2013: Letter of Intent submitted to the **CERN SPSC [CERN-SPSC-2013-022]**
- January 2014: Recommendations of CERN SPSC
- 2014-15: Transition phase towards TDR (technical design)
  - Some IAXO preparatory activity already going on as part of CAST near term program: IAXO pathfinder system in CAST in 2014-15
  - Preparation of a MoU to carry out TDR work.
  - Strengthen collaboration, awareness actions, meetings, coordinated funding applications
  - First discussion on long-term plan to construction
- 2017: Formal constitution of collaboration
  - “Founding” IAXO collaboration meeting to happen 3-4<sup>th</sup> July 2017, DESY

# “Founding” IAXO collaboration 3-4<sup>th</sup> July: You are all welcome!!

The screenshot shows a web browser window displaying the Indico event page for the 7th General IAXO Collaboration Meeting. The browser's address bar shows the URL <https://indico.cern.ch/event/622974/overview>. The page features a blue header with the IAXO logo and the text "The International Axion Observatory". Below the header, the event title "7th General IAXO Collaboration Meeting" is prominently displayed. The event dates are listed as "3-4 juillet 2017" at "DESY" in the "Europe/Zurich timezone". A search bar is located to the right of the dates. On the left side, there is a navigation menu with the following items: "Vue d'ensemble", "Ordre du jour", "Inscription", "Participant List", "Accommodation", and "Travel hints". The main content area contains three paragraphs of text: the first states the meeting location and dates; the second explains the significance of the meeting as the "founding" meeting; and the third describes the topics to be discussed, including the physics case and the status of the project components. At the bottom of the page, there is a timeline showing the event starts on "3 juil. 2017 09:00" and ends on "4 juil. 2017 18:00" at the "DESY" location.

Participant List  
Accommodation  
Travel hints

The 7th General IAXO Meeting will take place at DESY, Hamburg, on the 3rd and 4th July 2017.

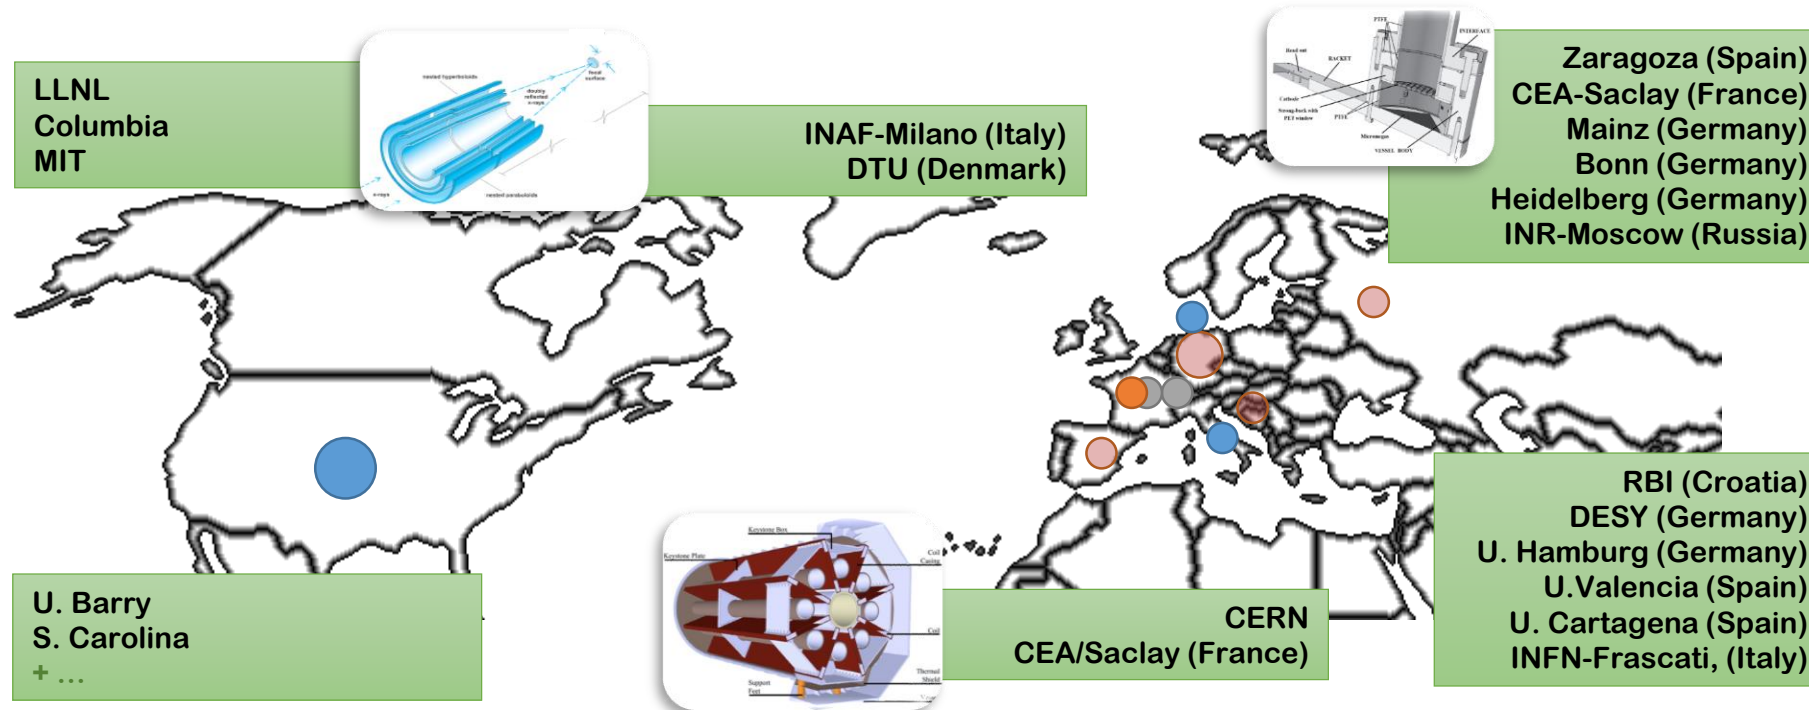

IAXO is at the point of getting formally established as a collaboration. We will sign the collaboration bylaws in this meeting. Therefore, this will be the "founding" meeting of the collaboration.

The physics case of the experiment will be reviewed, with a special stress on the latest studies and updates. The status of the different parts of the project (magnet, optics and detectors) will be presented and discussed, as well as the next steps of the collaboration.

Commence 3 juil. 2017 09:00  
Fin 4 juil. 2017 18:00  
DESY

# IAXO proto-collaboration

- Big effort to strengthen collaboration → large consortium involved in a number of funding applications, covering all TDR needs

New partners welcome...

(\* ) Only shown groups for which formal activity is ongoing or under discussion/preparation.  
 Potential interest in more groups than shown

# IAXO TDR baseline plans

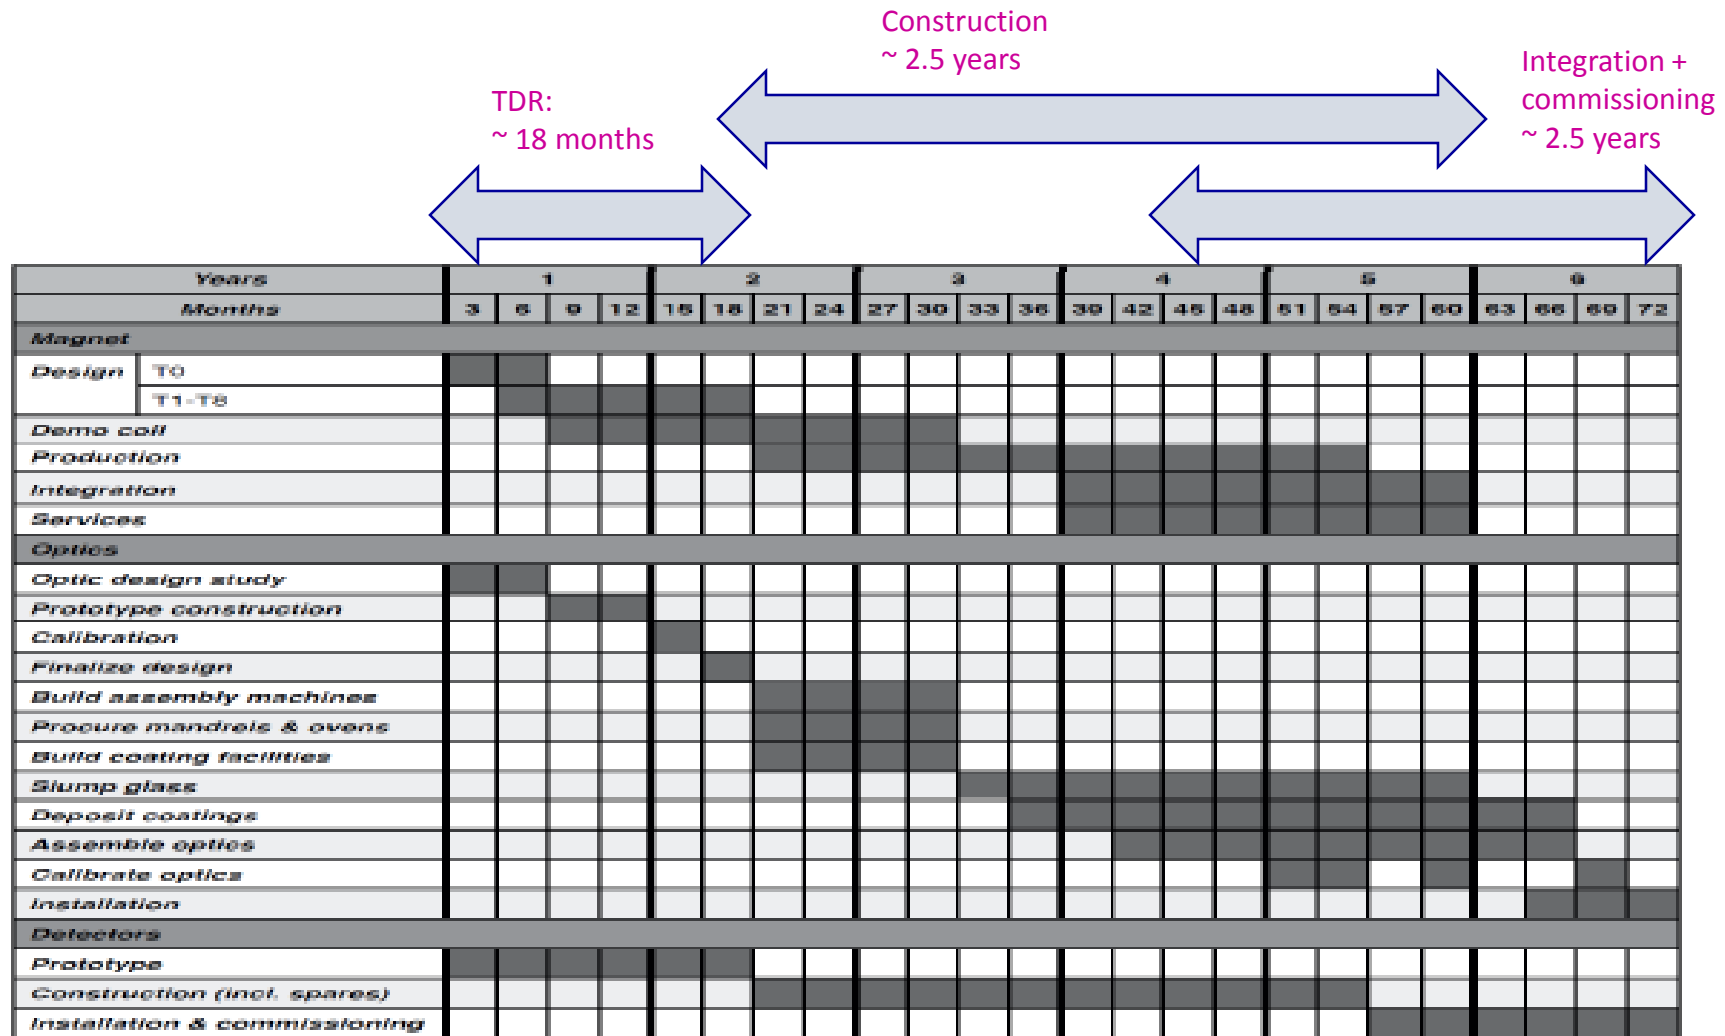

- **IAXO-T0**: demonstration coil magnet
- **IAXO-X0**: prototype x-ray optics
- **IAXO-D0**: prototype low background detector setup testing different technologies for detector
- Studies to refine IAXO physics case
- Additional physics potential (DM options)
- Site studies
- Consolidate and structure collaboration

IAXO-X0

# IAXO timeline

# Extended TDR (→Mini-IAXO / BabyIAXO concept)

- Alternative magnet designs
  - **Pros:** higher FOM with less conductor, modularity
  - **Cons:** higher risk → need intermediate demonstrating magnet prototype
- **BabyIAXO concept:**
  - Test magnet design at relevant scale (only 1 bore full diameter)
  - Test bench for optics + detector
  - Will deliver relevant physics (at intermediate level)
- Will better mobilize community & increase interest
- Better (and more staged) access to funding
- **Effect on near-term planning under study**

Single 60-cm bore  
Several conductor  
configurations  
under consideration

# Conclusions and next steps

## Axion searches → strong physics case

Increasing experimental effort in the different axion searches strategies: solar axions, relic axions, laboratory axions...

CAST has been a very important milestone in axion research during the last decade

## IAXO can probe deep into unexplored axion-ALP parameter space

IAXO could become next large project & a **generic axion facility with discovery potential in the next decade**

Need to continue with TDR & preparatory activities, formal endorsement & resources finding

MinilAXO / BabyIAXO → new concept that can

- Enhance final FOM of experiment
- Catalize near-term activities in the collaboration towards an intermediate experiment with relevant physics outcome

**Exciting work in front us: join us!**

# <http://iaxo.web.cern.ch/iaxo/>

## Home

Welcome to the home page of the IAXO project!

The International Axion Observatory (IAXO) is a proposed fourth generation axion helioscope. It aims at a sensitivity much improved with respect to past and current axion searches, with real discovery potential.

The conceptual design of the experiment has been finished and a [Letter of Intent submitted to CERN](#). Recently, the SPSC has recognised the physics case of IAXO and has recommended to proceed with a Technical Design Report.

# IAXO costs

---

Item	Cost (MCHF)	Subtotals (MCHF)
<b>Magnet</b>		<b>31.3</b>
Eight coils based assembled toroid	28	
Magnet services	3.3	
<b>Optics</b>		<b>16.0</b>
Prototype Optic: Design, Fabrication, Calibration, Analysis	1.0	
IAXO telescopes (8 + 1 spare)	8.0	
Calibration	2.0	
Integration and alignment	5.0	
<b>Detectors</b>		<b>5.8</b>
Shielding & mechanics	2.1	
Readouts, DAQ electronics & computing	0.8	
Calibration systems	1.5	
Gas & vacuum	1.4	
Dome, base, services building and integration		3.7
<b>Sum</b>		<b>56.8</b>

Table 5: Estimated costs of the IAXO setup: magnet, optics and detectors. It does not include laboratory engineering, as well as maintenance & operation and physics exploitation of the experiment.

# Originalities of CAST

- Use of X-ray telescope → increase S/B noise → sensitivity improved by a factor 150 by focusing a  $\varnothing 43$  mm x-ray beam to  $\varnothing 3$  mm

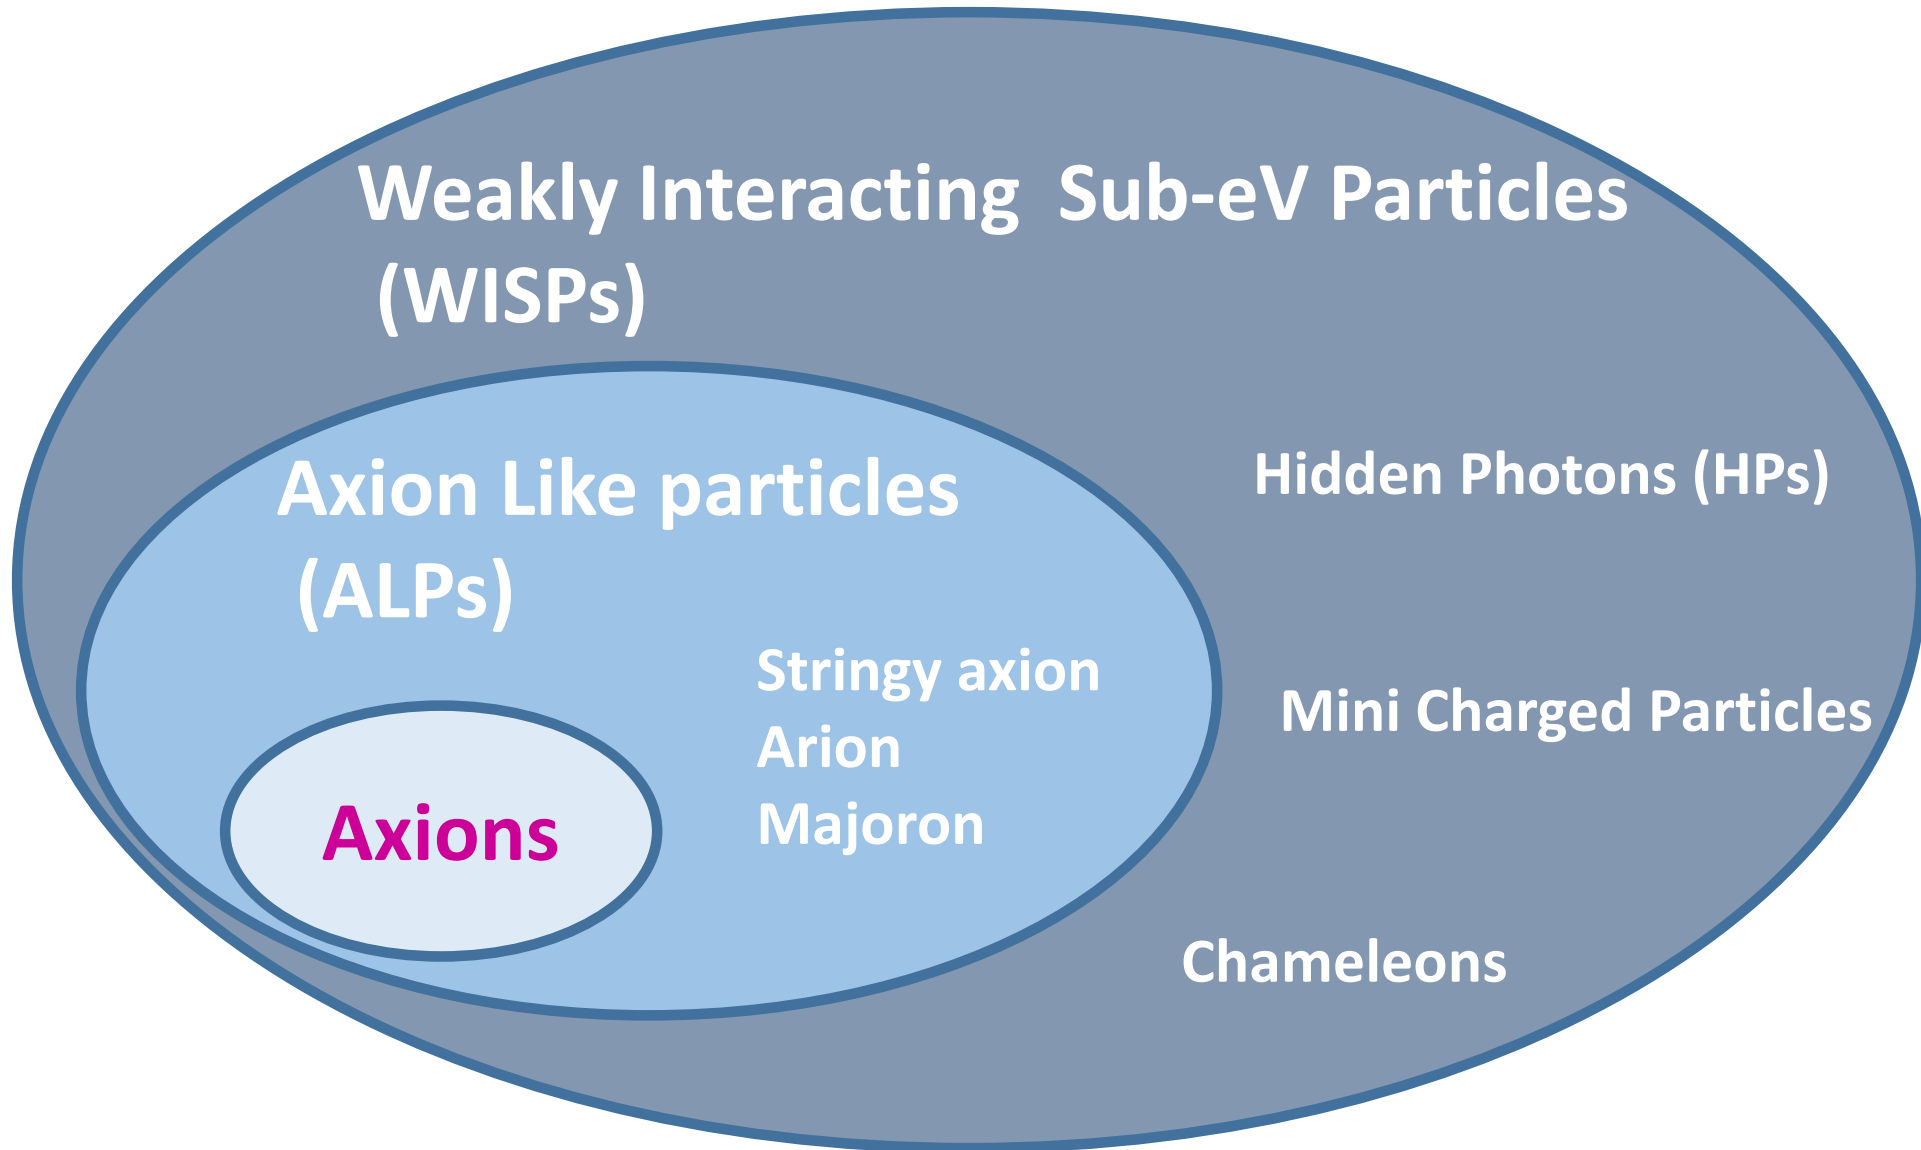

- Low background techniques → shieldings, low radioactive materials, simulation and modeling of backgrounds....

# The WISPs zoo

---

$g_{a\gamma}$  and  $m_a$  are two independent “phenomenological” parameters
