## Dark Matter at High Nuclear Recoil

*Tuesday 20 June 2017 17:30 (15 minutes)*

There exist well motivated models of particle dark matter which predominantly scatter inelastically off nuclei in direct detection experiments. This inelastic transition causes the dark matter to up-scatter in terrestrial experiments into an excited state up to 550 keV heavier than the dark matter itself. An inelastic transition of this size is highly suppressed by both kinematics and nuclear form factors. In this paper, we extend previous studies of inelastic dark matter to determine the present bounds on the scattering cross section, and the prospects for improvements in sensitivity. Three scenarios provide illustrative examples: nearly pure Higgsino supersymmetric dark matter; magnetic inelastic dark matter; and inelastic models with dark photon exchange.

### Presentation type

Parallel talk

**Authors:** Prof. MARTIN, Adam (University of Notre Dame); BRAMANTE, Joseph Andrew; FOX, Patrick; KRIBS, Graham

**Presenter:** Prof. MARTIN, Adam (University of Notre Dame)

**Session Classification:** Parallel III
