Scientific Linux Status Report and Plenary Discussion

Thursday, October 29, 2009 11:45 AM (30 minutes)

Progress of Scientific Linux over the past 6 months. What we are currently working on. What we see in the future for Scientific Linux.

Also we will have a Plenary discussion to get feedback to and input for the Scientific Linux developers from the HEPiX community. This may influence upcoming decisions e.g. on distribution lifecycles, and packages added to the distribution.

Web application security

Thursday, October 29, 2009 9:00 AM (30 minutes)

CERN hosts a large number of Web sites (CERN-related, but also private), both on central Web Services, as well as on machines managed by particular Web site owners. Some of these Web sites are actually interactive Web applications developed with languages like PHP, ASP, Java, Perl, Python etc. - and unavoidably a fraction of them have bugs making them vulnerable to attacks such as Cross Site Scripting (XSS), Code/SQL Injection, Cross Site Request Forgery (CSRF), and so on. To address this issue, several Web application vulnerability assessment tools have been evaluated at CERN, and chosen ones are used to find vulnerabilities before the attackers do. This talk will discuss the choice of tools, the findings, and suggestions how Web application security can be improved in large organizations.

Performance of Hadoop file system on a HEPiX storage workgroup testbed

Monday, October 26, 2009 2:45 PM (30 minutes)

This work is continuation of storage solution testing performed by HEPiX storage workgroup on it's testbed at FZK. Hadoop, an Apache project, offers a cluster file system called HDFS inspired by Google File System and designed to run on commodity hardware. It has gained some popularity in OSG, where is has become a supported storage solution, and is currently in production at a few T2 sites.

In this series of tests we used HEPiX testbed worker nodes' hard drives as a underlying storage, without using external file servers or storage arrays. We used a standard HEPiX storage application suite to evaluate performance of this solution. We present obtained results in this paper.

Evolution of virtual infrastructure with Hyper-V

Tuesday, October 27, 2009 3:30 PM (30 minutes)

The Internet services group provides the infrastructure and sophisticated management tools for virtual machine provisioning based on Hyper-V, Microsoft Virtual Machine Manager, management SOAP web services and a user web interface. This virtualisation service has already confirmed its reliability and efficiency by wide range of satisfied users. The infrastructure which was presented at the last HEPiX meeting has undergone significant improvements, which allowed us to provide new features - live migration, rapid provisioning and better Linux support. This talk will present these important updates of our infrastructure and summarize the experience gained from running the Linux operating system in the virtual machines.

Monitoring tape drives and medias at CC-IN2P3

Wednesday, October 28, 2009 11:30 AM (30 minutes)

Due to the continuous load and intensive usage on our robotics, we regularly face some hardware issues with tapes and tape drives. A recurrent issue concerns possible data loss which leads to go through a long recovery process.

In order to improve our reliability, we have studied commercial solutions to avoid permanent write/read errors, or at least foresee occurring errors. We've tested two products (one month period each) and purchased the one that met our requirements best.

In this talk I'll expose the criteria to select the product, our daily usage after 4 months of use and finally what we expect to do with/around it in the near future.

IN2P3 HPSS Migration (v5.1 to 6.2) report

Tuesday, October 27, 2009 1:40 PM (25 minutes)

IN2P3 Computing Center has been using HPSS as a Mass Storage System since 1999. There has been no major system upgrade since 2005 and IN2P3 still runs HPSS 5.1. This version is no more supported by IBM and doesn't include the T10K-B drive support.

In June 2009, the system has been upgraded to HPSS 6.2.2.2. This upgrade implies major changes (DCE removal, DB2 and systems upgrade).

This presentation will expose all the operations done to upgrade the system during a 3 day downtime, and the issues encountered.

- HPSS new 6.2 features and changes.
- Operation planning.
- Systems preparation.
- Core server Migration.
- Metadata Migration.
- Issues encountered.

Security aspects of the WLCG infrastructure

Thursday, October 29, 2009 9:30 AM (30 minutes)

The Worldwide LHC Computing Grid (WLCG) infrastructure has been built up for the storage and analysis of the very large data volumes that will be recorded by the LHC experiments. Its existing security mechanisms and policies are foreseen to evolve in various respects, for example with an increasing use of virtual machines, pilot jobs, clouds, enhancements to data storage and access models, and potential integration with single sign-on campus-wide or federated identity management systems. To steer such evolution, input from the HEPiX community would be very desirable.

Batch virtualization project at CERN

Monday, October 26, 2009 3:30 PM (30 minutes)

Between March and August 2009 a project has been set up at CERN with the aim to evaluate possibilities to use virtualization at a large scale, with the focus on batch computing. Two key issues have been identified for this specific application: the placing of virtual machines on an appropriate hyper-visor, and the selection of an appropriate image which should be driven by the actual demand. Both commercial and free software solutions exist which are able to solve the placing issue.

The virtual machine orchestrator, VMO, a commercial solution by Platform computing, and the free software solution OpenNebula have been evaluated during the project. For VMO, the vendor provided a first implementation of an algorithm for selecting the image to be deployed, which is driven by user requirements of pending batch jobs. For OpenNebula, an external mechanism needs to be developed to perform this task. In the presentation, the basic concepts of the project and lessons learned will be presented. Further visions and possible implications for services offered at CERN will be described.

Benchmarking of CPU servers

Tuesday, October 27, 2009 11:15 AM (30 minutes)

The recent generation of Intel XEON CPUs comes with support for symmetric multi processing, formally known as hyperthreading. In addition, a new CPU feature has been added, the Intel Turbo mode. The influence of these features on the system performance has been tested using the HEPSPC06 benchmark suite, with enhanced statistics, and a study of the scaling behaviour has been done.

The results of these tests are presented, and consequences for certain applications as well as for procurement procedures themselves are discussed.

Options for expanding CERN's computing capacity without a new Building

Wednesday, October 28, 2009 4:00 PM (30 minutes)

CERN is approaching the limit of what can be housed in its Computer Centre but there is no clear consensus about the provision of new capacity. While discussions continue, CERN has decided to take two interim measures, partly to satisfy immediate and medium-term needs and partly to gain experience in these domains, namely external hosting and the acquisition and operation of container-based solutions. I will describe the options considered for each of these and expose our current plans.

Open Source Solution for Monitoring of Grid Services in WLCG

Wednesday, October 28, 2009 10:30 AM (30 minutes)

Since 2005 Worldwide LHC Computing Grid (WLCG) services have been monitored by the Service Availability Monitoring (SAM) system which has been the main source of information for the monthly WLCG availability and reliability calculations.

During this time SAM framework gained popularity amongst site and service managers and was very useful in building robust grid infrastructure.

Experience with this monitoring tool as well as preparation to the evolution of the European grid infrastructure from EGEE to national grid initiatives (NGI) led to design of the enhanced and distributed model for monitoring grid services. Nagios has been adopted as a monitoring framework and messaging technology (ActiveMq) has been chosen as a transport mechanism.

This talk covers the architecture of the new system.

ScotGrid, A UK ATLAS Tier 2 Approaching Readiness for Data Taking

Tuesday, October 27, 2009 9:45 AM (15 minutes)

This presentation will provide an overview of the very successful UK ATLAS Tier-2, ScotGrid, as we fast approach LHC data taking and data analysis. This will cover a variety of topics, ranging from an overview of the fabric and middleware, the site's current readiness, success during STEP, storage issues, site optimisations all the way through to disaster planning and site security. The presentation will conclude with a look into the future and how we can retain our position as one of the most successful ATLAS Tier-2 centres.

ITIL's roles and tools from a perspective of a Scientific Computing Centre

Thursday, October 29, 2009 2:15 PM (30 minutes)

The Karlsruhe Institute of Technology (KIT) was founded at 1st October 2009, merging the University of Karlsruhe and the Forschungszentrum Karlsruhe. As a first new organizational unit of the KIT the Steinbuch Centre for Computing (SCC) was established, combining the former Institute for Scientific Computing of Forschungszentrum Karlsruhe and the Computing Centre of the Technical University Karlsruhe. The KIT merge process directly influenced the SCC which has to cover two locations with a distance of 10 km.

The IT service management, according to the industrial standard "IT Infrastructure Library (ITIL), was selected by the SCC as a strategic element to support the merging of the two existing computing centres. The service support processes of ITIL like: Incident, Problem, Change, Configuration and Release Management are the basis of SCC's first class IT Services. The talk explains the different roles and tools of each ITIL support process and it puts attention to the special needs of GridKa, the German Tier-1 centre of the WLCG infrastructure, hosted at the SCC.

Optimizing tape data access

Tuesday, October 27, 2009 2:30 PM (25 minutes)

TReqS is our Tape Request Scheduler. Based on BNLBatch, its goal is to get between dCache and HPSS and to reorder the files requests.

Since May of this year, a first implementation hit our production system.

We will present here :

- the problematic of tape access for LHC experiments
- the solution we implemented
- TReqS in its production environment, our 5 month experiment with the beast

Summary

All LHC experiments use dCache as a front end to file access at most T1 sites.

At CCIN2P3, dCache is interfaced with HPSS. While writing to the mass storage system is effective, reading from it has shown to be most unsatisfying.

The major cause of this issue is that dCache has no knowledge about the files location on tape and the reading requests are rather chaotic from the HPSS point of view. It generates a lot of useless tape mount and dismount and the average dCache activity impacts the HPSS system badly.

We present here TReqS, a method for scheduling the file requests and submit them to HPSS to ensure a staging order and minimize the access latency due to the tape movements in the library. TReqS is based on BNLBatch, itself based on OakRidge batch Scheduler.

We will present the global concept and show the results and the conclusions of 6 month of tape scheduling.

Linux Desktop Management with old school NFS-root boot

Thursday, October 29, 2009 4:30 PM (30 minutes)

The standard Linux desktops at GSI received their operating system via NFS and not from the local hard drive since the last millennium.

Since then this policy has been enhanced to work with shared read-only OS images that provide advanced security and fast OS deployment and upgrades. Image generation and configuration management of NFS-root desktops is completely integrated into our infrastructure for standalone servers.

My talk will give an overview of the currently used techniques, the shortcomings of this approach and an outlook on our future plans.

ESnet: Networking for Science

Friday, October 30, 2009 9:00 AM (30 minutes)

This talk will cover an introduction to the Energy Sciences Network (ESnet). It will outline both ESnet as a program in DOE's Office of Science and the current network implementation known as ESnet4. The roles of both components of ESnet4, the IP network and Science Data Network (SDN) will be discussed. The presentation will also touch upon several international network collaborations that ESnet is taking a key roles in to advance the usability of R&D networks to support science. Lastly, the talk will cover ESnet's participation in ARRA funded research into the demonstration of 100Gbs wide area networks.

Adopting Quattor for managing the UK Tier 1 fabric at RAL

Thursday, October 29, 2009 10:15 AM (30 minutes)

The UK Tier 1 Centre at RAL will increase in size significantly in the coming year. The need for better automation of both system deployment and ongoing configuration management has prompted a survey of possible solutions. Since deciding to adopt Quattor earlier this year, we have successfully deployed our new SL5 batch service using the system and are already seeing better consistency and easier management. The talk will discuss the options we considered and planning and carrying out the deployment of a complex management system while avoiding disruption of the running farm.

Unified Performance and Environment Monitoring using Nagios, Ganglia and Cacti

Wednesday, October 28, 2009 11:00 AM (30 minutes)

We present a method of monitoring the environment and performance using open source tools such as Nagios, Ganglia and Cacti to collect and display performance data as well as availability information for various components of large computing systems in an integrated fashion. We will present information on how the data is collected, viewed and analyzed, with specific examples from NERSC's Cray system.

Deploying and Using the Lustre Monitoring Tool

Thursday, October 29, 2009 11:15 AM (30 minutes)

The Lustre Monitoring Tool (LMT) provides a useful view of the server-side behavior of the Lustre parallel file system. This talk presents a brief overview of the architecture of the tool and explores several use cases including tracking system health, server-side performance tuning, applications-side performance tuning, and incident evaluation, among others.

Intel HPC environment for Silicon Design and Key Learnings

Wednesday, October 28, 2009 4:30 PM (30 minutes)

Silicon design technical complexity is increasing every year due to several new features and process technology shrinks. Additionally, the business drivers such as shorter product development time, reduced headcount, and lower cost is increasing pre-silicon verification, high degree of design automation, and global multi-site design teams. These two factors (technological and business) are astronomically increasing demand on computing and storage driving design computing to be engineered as an HPC environment. This presentation will cover Intel HPC design compute environment, generational improvements, and realized value in the areas of compute clusters, very high large memory servers, optimal network, and parallel storage.

First exercises with PROOF on NFS v4.1/pNFS

Tuesday, October 27, 2009 2:55 PM (20 minutes)

At DESY we have installed a testbed for Grid and storage related issues. One of the first trials we did was running a ALICE Proof job against data held in a distributed NFS 4.1 service based on dCache. Also trails were made against an industrial system, of which I am not allowed to speak yet. Comparisons we made with regard to scaling in PROOF and IO performance in comparison to NFS3 To make it more savvy, we have an accompanying movie which shows the running computation and the IO received.
