Where, when and how SUSY is showering in the sky

Thursday 26 July 2007 14:20 (20 minutes)

Cosmic Rays and UHECR are reaching highest energy well above LHC ones. Because photopion production they might hide UHE GZK neutrino that may airshower at Earth Horizons. These Airshowers mostly are Tau induced ones. SUSY traces might be also searched inside the same UHECR shower occurring on Earth. Indeed UHE neutralino and other surprising SUSY secondaries may offer a novel Astronomy at the edge by inclined airshowering. We explain why such SUSY and Neutrino traces maybe discovered in present Telescopes, as MAGIC one, and Gamma Satellites as GLAST, EUSO ones. Where, when and how their traces maybe revealed and disentangled from Neutrino ones will be shown in details.
