New Tests for Sub-Gravitational Forces at Short Distances

Thursday 26 July 2007 17:10 (20 minutes)

Many theories beyond the Standard Model predict new particles that can mediate sub-gravitational strength forces at short distances. Recent advances in atom interferometry will allow a new round of experiments searching for sub-gravitational strength forces in the 1 micron to 100 meter length scales. I will describe the experiments and prospects for future improvements.
