

Transverse momentum spectra of cumulative particles and the quark coherent coalescence

Vladimir Vechernin
Saint-Petersburg State University
v.vechernin@spbu.ru

NA61-Theory virtual seminar

23 March 2017

Outline

- Introduction. Definition of cumulative phenomenon.
- Cumulative kinematics: projectile and target fragmentation regions.
- Quark counting rules and the limiting fragmentation of nuclei.
- Deep Inelastic Scattering (DIS) in cumulative region.
- Description of flucton structure function asymptote near cumulative thresholds by the intrinsic diagrams of QCD in light-cone gauge.
- Explanation of the different slopes for DIS and for particle production in cumulative region.
- Direct and spectator contributions to the cumulative quark formation.
- Transverse momentum spectra of cumulative pions.
- Production of cumulative protons by Coherent Coalescence of three quarks (correspondence with the approach of Few Nucleon Short-Range Correlations in Nuclei).
- Suppression of contributions from non-diagonal quark coalescence diagrams.
- Transverse momentum spectra of cumulative protons.
- Comparison of transverse momentum spectra of cumulative pions and protons for various cumulative numbers.

Cumulative Particle Production

Production of particles from nuclei in a region, kinematically forbidden for reactions with free nucleons.

Cumulative Pion Production

1970 - Nuclotron@Dubna – beams of relativistic deuterons ($p_0=5 \text{ GeV}/c/\text{nucleon}$)

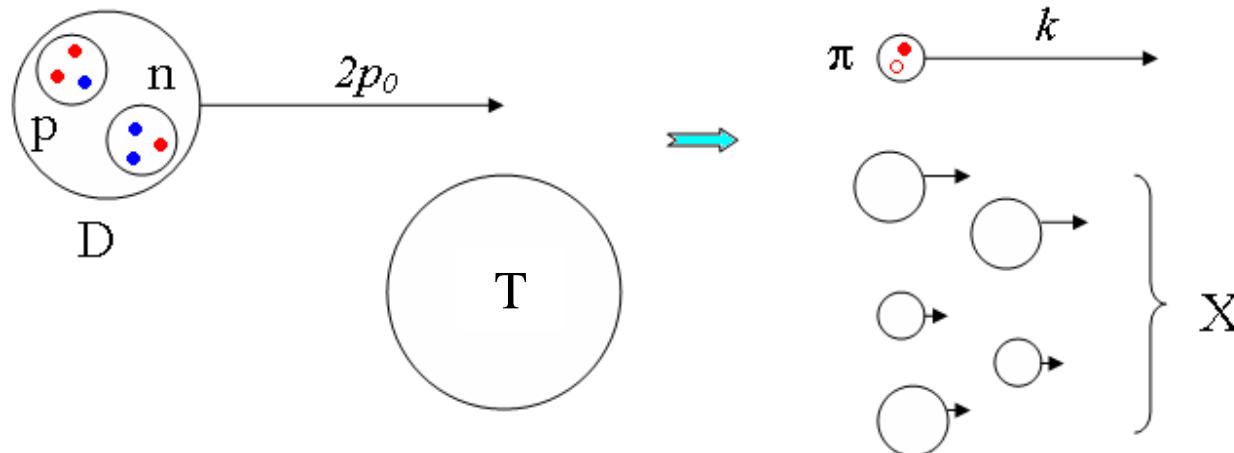

Stavinskiy V.S. =>

Fragmentation of projectile deuterons, D, on some target, T.

Baldin A.M. et al., Yad.Fiz. 18 (1973) 79

$p_0 \gg m_N :$ $p_0 < k < 2p_0$ - cumulative pions

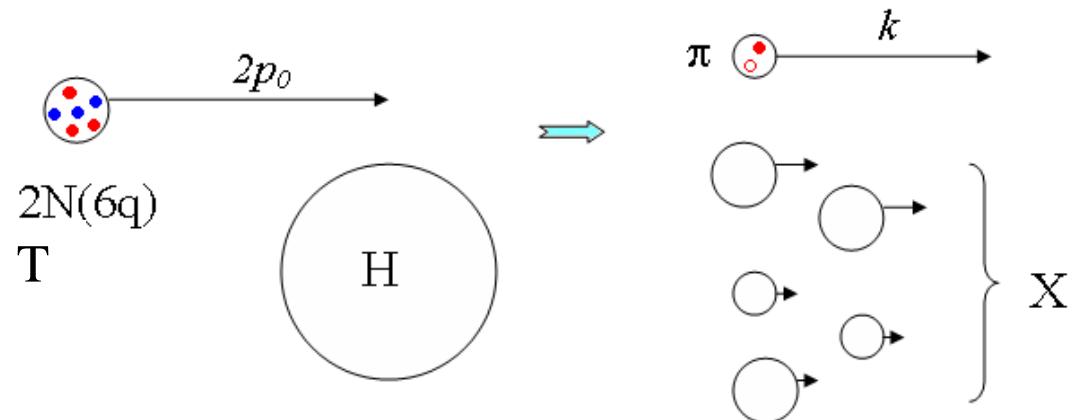

Flucton – intrinsic droplet of dense cold nuclear matter in a nucleus

Blokhintsev D.I., JETP 33 (1957) 1295

($2N$ flucton – 6 quark state)

$\sim 5\%$ $2N(6q)$ – flucton admixture in D

Common $6q$ -bag

Fragmentation of **projectile** nucleus \Leftrightarrow Fragmentation of **target** nucleus
(the same phenomenon in different frames of reference)

Cumulative fragmentation of **target** nucleus:

The 1st experimental observations of the **backward** particle production in $p+A$ collisions on a **fixed target** nucleus:

G.A. Leksin et al., ZhETF 32, 445 (1957)

L.S. Azhgirej et al., ZhETF 33, 1185 (1957)

Yu.D. Bayukov et al., Izv. AN SSSR 30, 521 (1966)

The Rutherford-like experiments indicating the presence of **droplets of dense nuclear matter in a target nucleus** (fluctons).

Kinematics of cumulative production

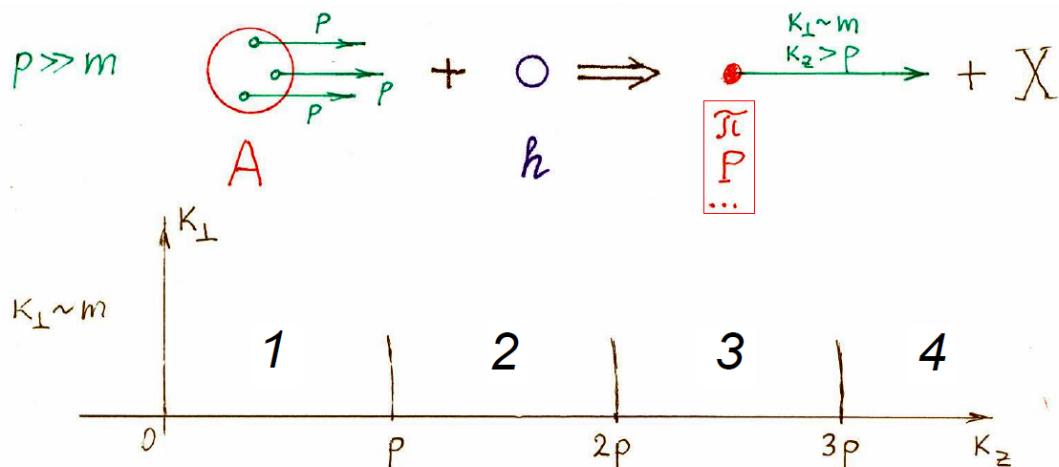

Fragmentation of **projectile** nucleus

$$x \equiv \frac{k_+}{p_+} = \frac{k_0 + k_z}{p_0 + p_z} \approx \frac{k_z}{p}$$

$k_z, p \gg m$, m – nucleon mass

$$x = 1, 2, 3, \dots, A$$

The borders increase with p

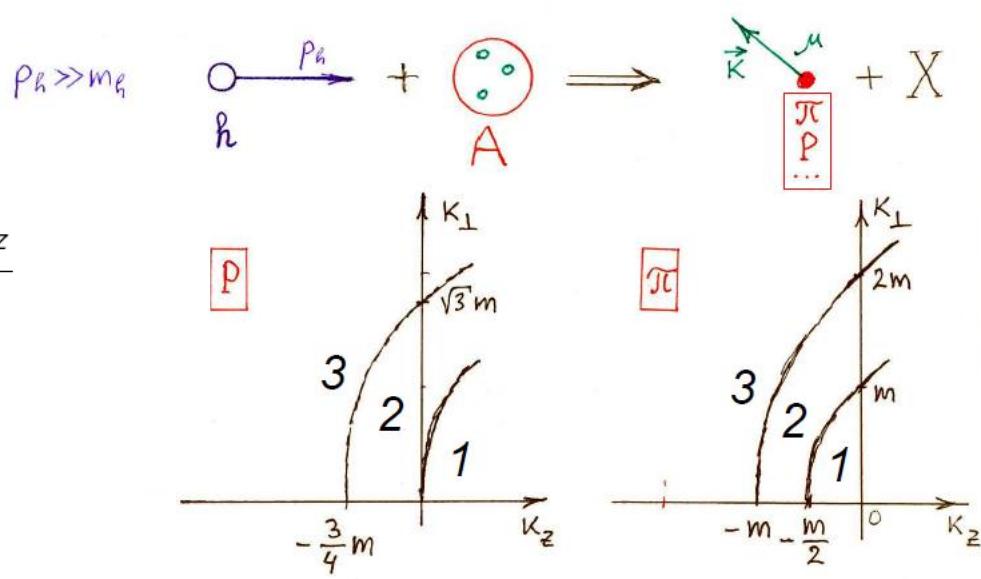

Fragmentation of **target** nucleus

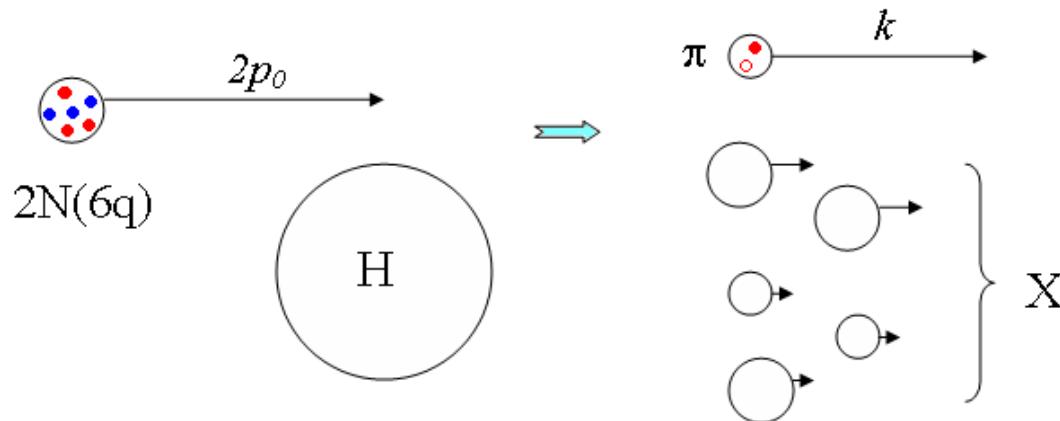

$$x \equiv \frac{k_-}{p_-} = \frac{\tilde{k}_0 - \tilde{k}_z}{m} = \frac{\sqrt{\tilde{k}_z^2 + k_\perp^2 + \mu^2} - \tilde{k}_z}{m}$$

$$\tilde{k}_z = -\frac{xm}{2} + \frac{k_\perp^2 + \mu^2}{2xm}$$

The borders are fixed at $p \gg m$

Limiting fragmentation of light nuclei. Quark counting rules.

$1 < x < 2$ - the cumulative region ($1 < x < f$ - for the fN flucton)

Theoretical description near upper threshold: for $2N(6q)$ flucton $k \rightarrow 2p_0$, $x = k/p_0 \rightarrow 2$ (Limiting fragmentation of a nucleus)

Quark counting rules: $I \sim \Delta^{2p-1}$

Δ – the deviation of x from its maximal value f , $\Delta = f - x$

p – the number of “donors”, stopped quarks, $p = n - 1$

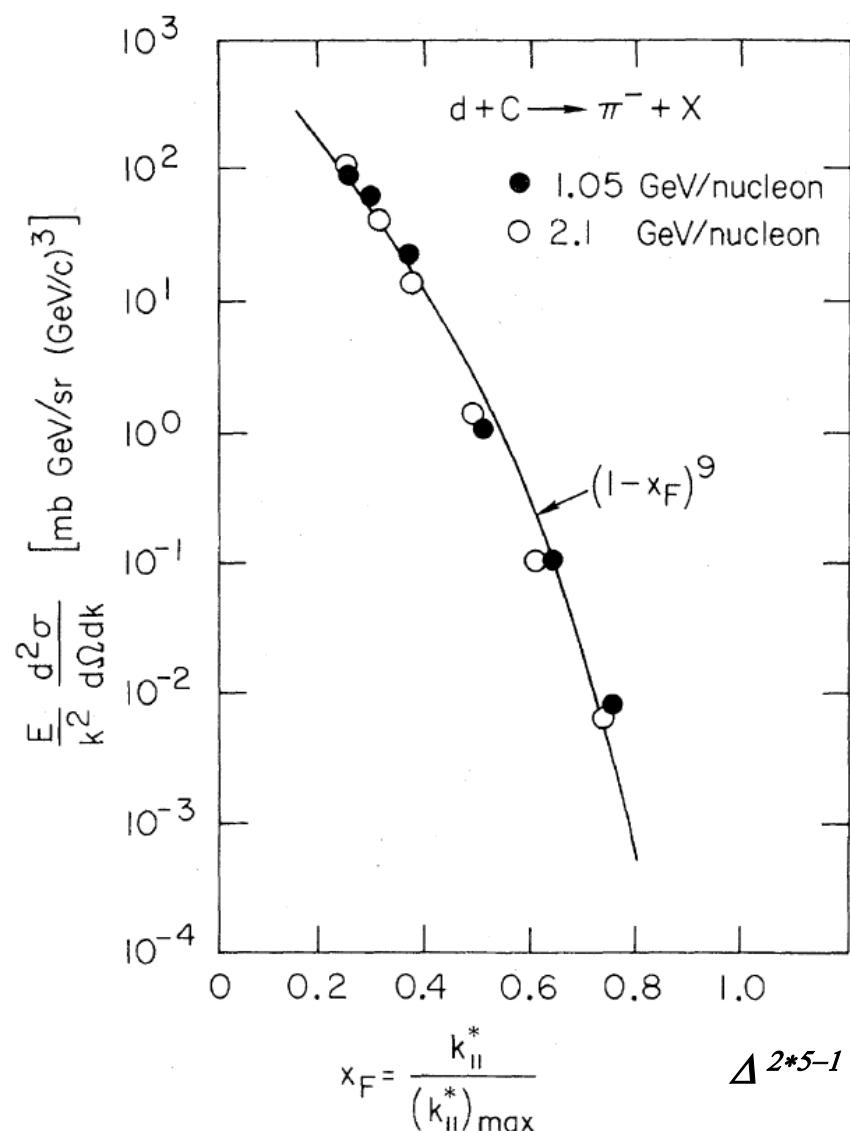

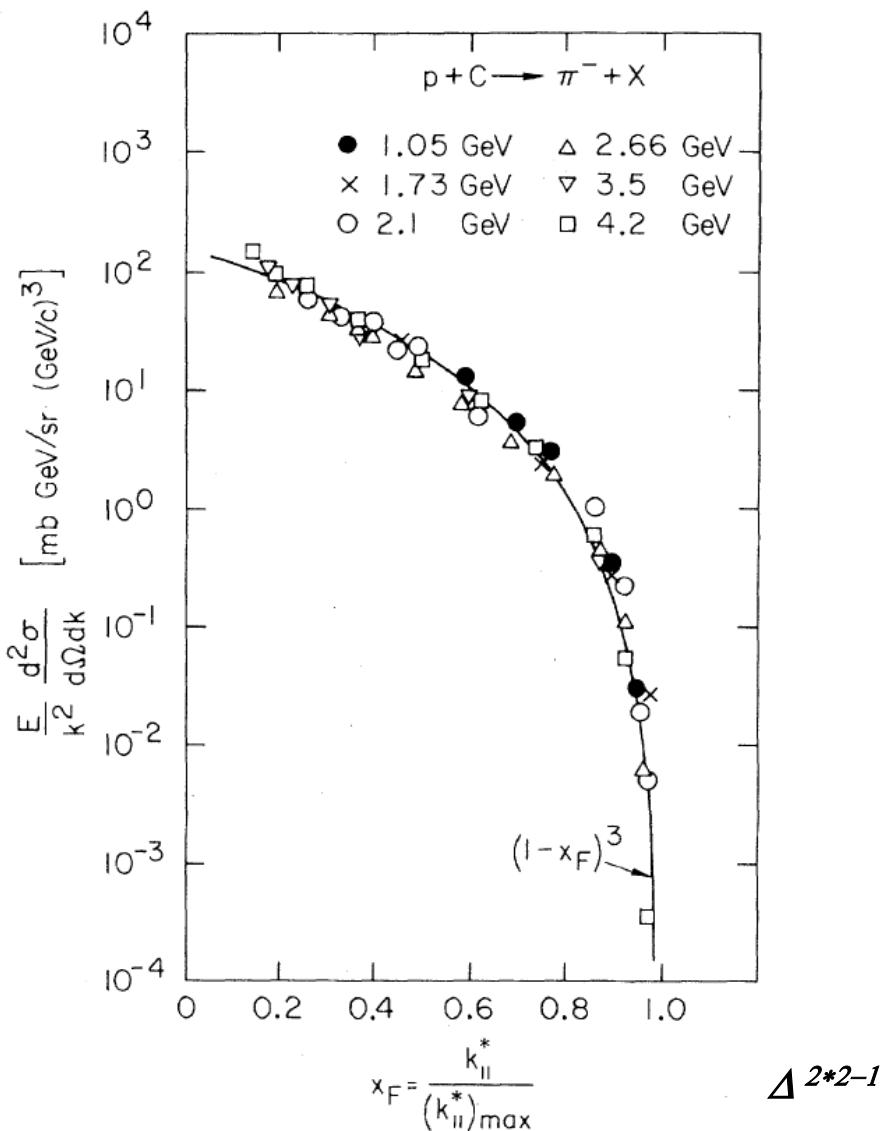

n – the number of constituents.

For $2N(6q)$ flucton $f = 2$, $n = 6$, $p = 5$, then $I \sim (2-x)^{2*5-1} = (2-x)^9 = \Delta^9$

Brodsky S., Farrar G. Phys.Rev.Lett. 31 (1973) 1153

Matveev V.A., Muradyan R.M., Tavkhelidze A.N. Lett. Nuovo Cimento 7 (1973) 719

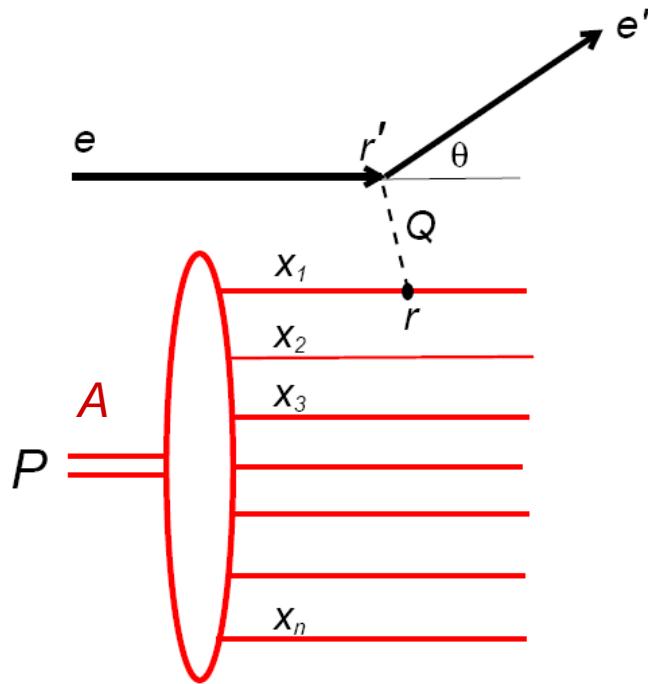

Brodsky S.J., Chertok B.T. Phys.Rev. D14 (1976) 3003; Phys.Rev.Lett. 37 (1976) 269

The experimental points from J. Papp et al., Phys.Rev.Lett. 34, 601 (1975).

Deep Inelastic Scattering (DIS) in cumulative region

*Lehman E., Phys.Lett.62B (1976) 296 – connection of the limiting fragmentation
of deuteron into pions with deuteron DIS structure function F_2 (5% $2N(6q)$ -flucton admixture in D)*

$$|\mathbf{r} - \mathbf{r}'| \sim 1/|Q|, \quad |Q| \gg m$$

$$\xi \equiv \frac{-Q^2}{2(pQ)} = \frac{-Q^2}{2mQ_0}, \quad p = P/A$$

$$0 < \xi < A, \quad 1 < \xi < A \text{ – cumulative region}$$

$$Q^2 = -4EE' \sin^2 \frac{\theta}{2}, \quad Q_0 = E - E'$$

$$x_1 \equiv \frac{k_{1+}}{p_+} \approx \frac{k_{1z}}{p} \geq \xi \text{ - Bjorken scaling variable}$$

$(x_1 = \xi \text{ for elastic } \gamma q)$

Experimental observations of DIS in cumulative region:

Shuetz W.P. et al., Phys.Rev.Lett., 38 (1977) 259 [D]

Filippone B.W. et al., Phys.Rev.C, 45 (1992) 1582 [Fe]

Benvenuti A.C. et al. (BCDMS collaboration) Z. Phys. C63 (1994) 29 [C]

Egiyan K.S., et al., Phys.Rev.Lett. 96 (2006) 082501 [${}^3\text{He}, {}^4\text{He}, \text{C}, \text{Fe}$]

Description of the hadron asymptotics at $x \rightarrow 1$

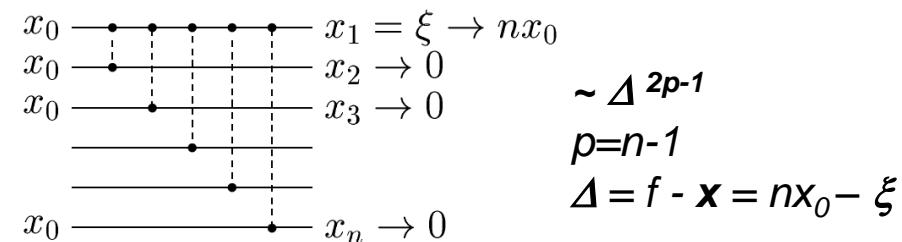

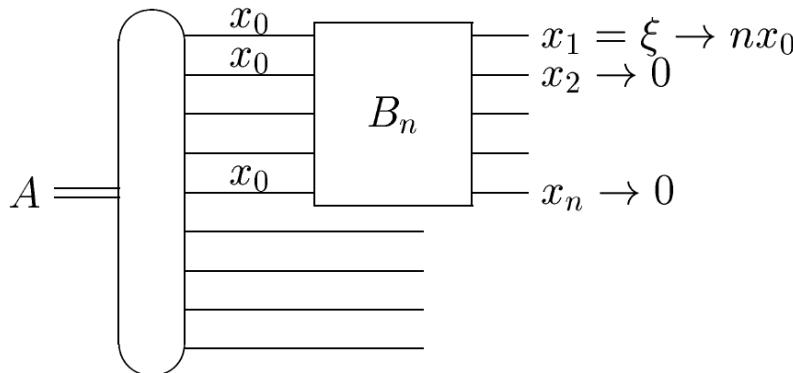

by the intrinsic diagrams of QCD in light-cone gauge
with low-x spectator quarks interact with the target

Brodsky S.J., Hoyer P., Mueller A., Tang W.-K., Nucl.Phys. B369 (1992) 519

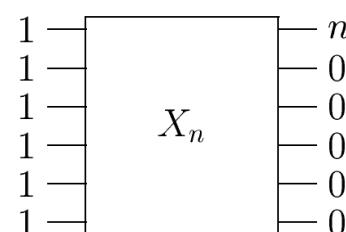

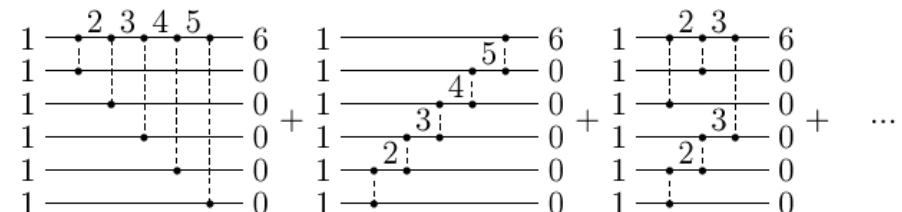

Description of the flucton asymptotic at $x \rightarrow f$,

f - the number of nucleons in flucton, n - the number of quarks in flucton, $x_0 = f/n (=1/3)$.

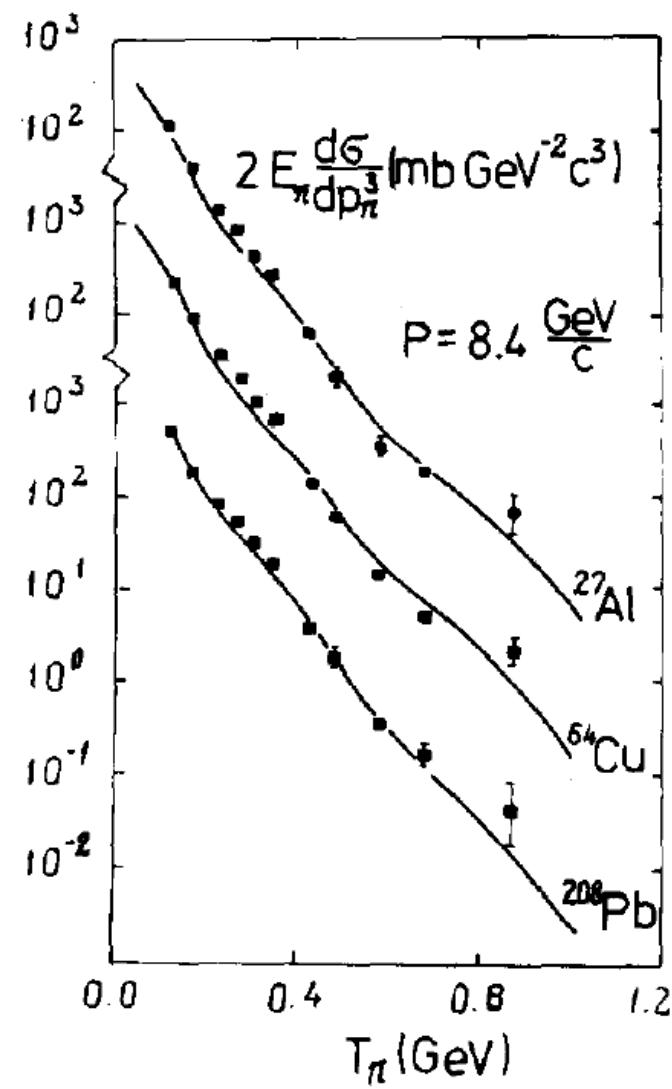

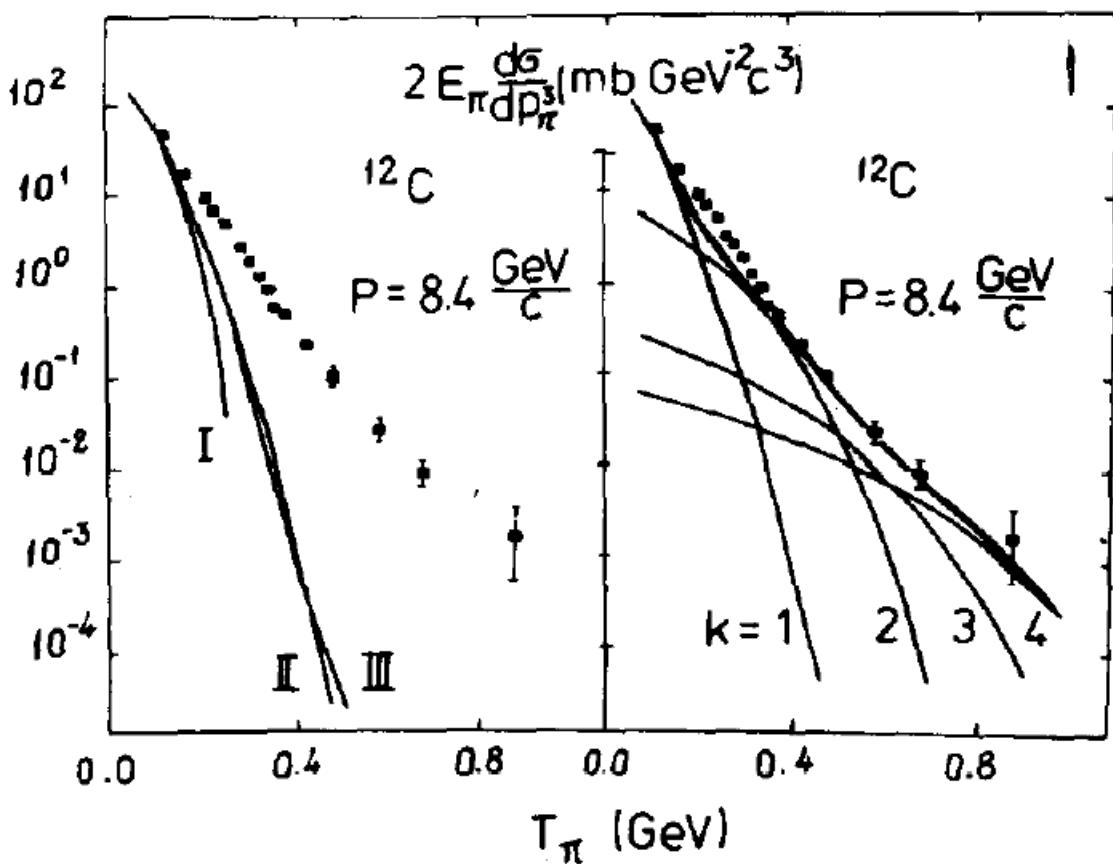

M.A. Braun, V.V. Vuchernin, Nucl.Phys. B427 (1994) 614.

At $x_1 \rightarrow f \Rightarrow$ all $x_2, \dots, x_n \rightarrow 0 \Rightarrow$ all $|q_i| \gg m \Rightarrow$
pQCD works \Rightarrow min.number of hard exchanges.
Simple instantaneous Coulomb part dominates
in light-cone gauge.

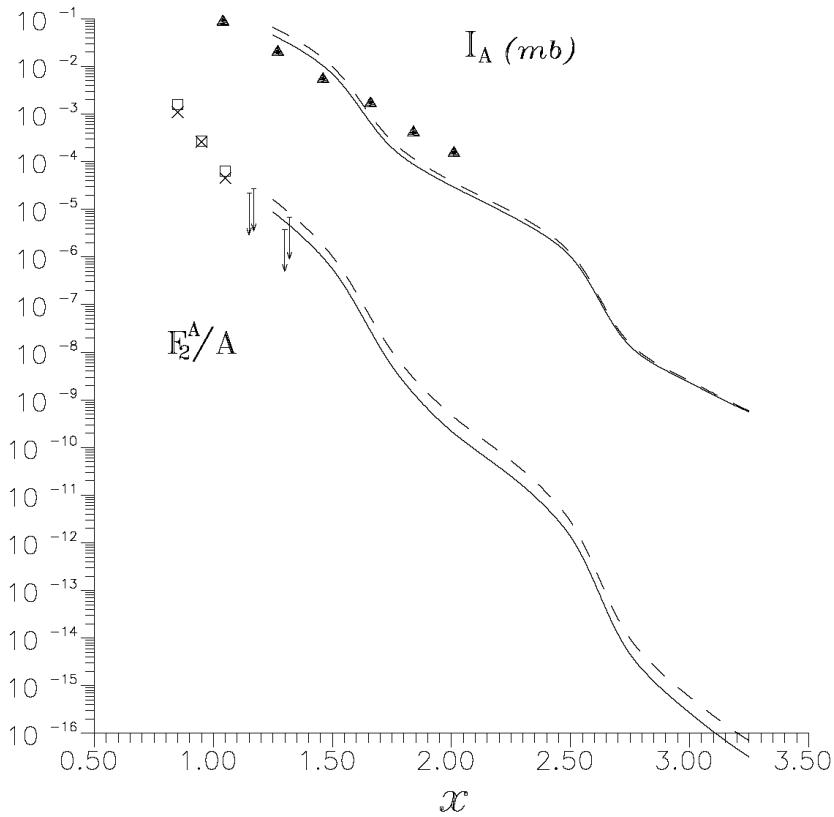

$$= \sum_{k=1}^{n-1} C_{n-2}^{k-1} X_k^k \begin{cases} n \\ n-k \end{cases} X_{n-k}^{n-k} \quad - \text{ the recurrence relation}$$

(a) Calculations of the invariant pion production cross section for ^{12}C : I – for the free proton target; II – with fermi motion; III – the relativization effect. (b) The contributions of separate fluctuations with mass $M_k = km_p$ where k is the order of cumulativity.

The experimental points from A.M. Baldin et al., Yad. Fiz. 18 (1973) 79.

The different slopes of spectra for DIS and for particle production in cumulative region

$$F_2^A(x) \sim \exp(-b_0 x) \quad b_0 \sim 16$$

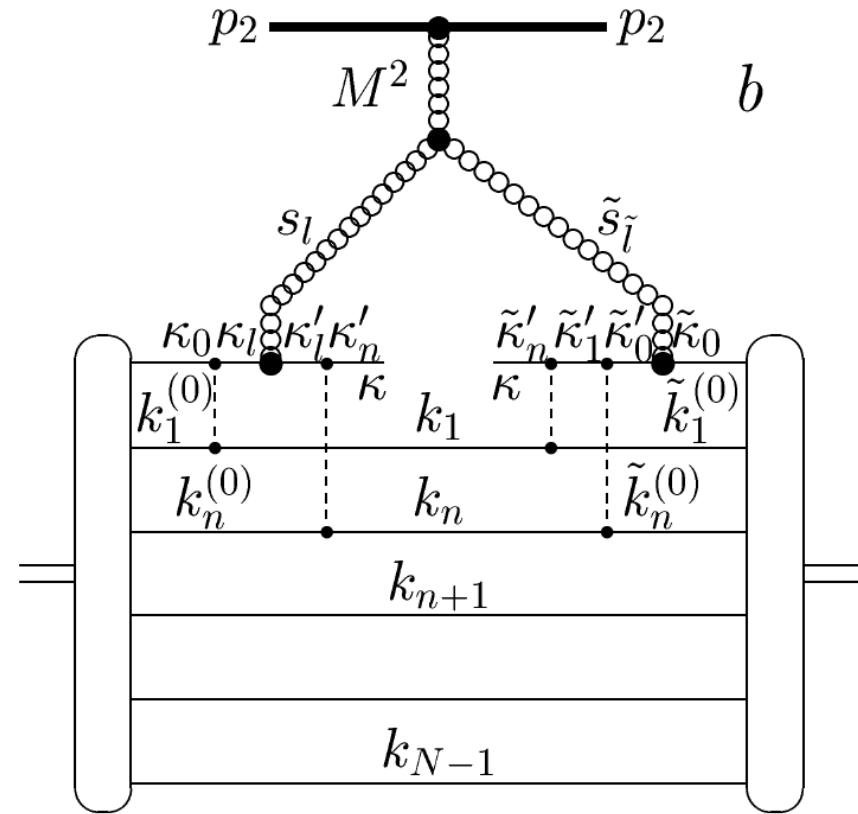

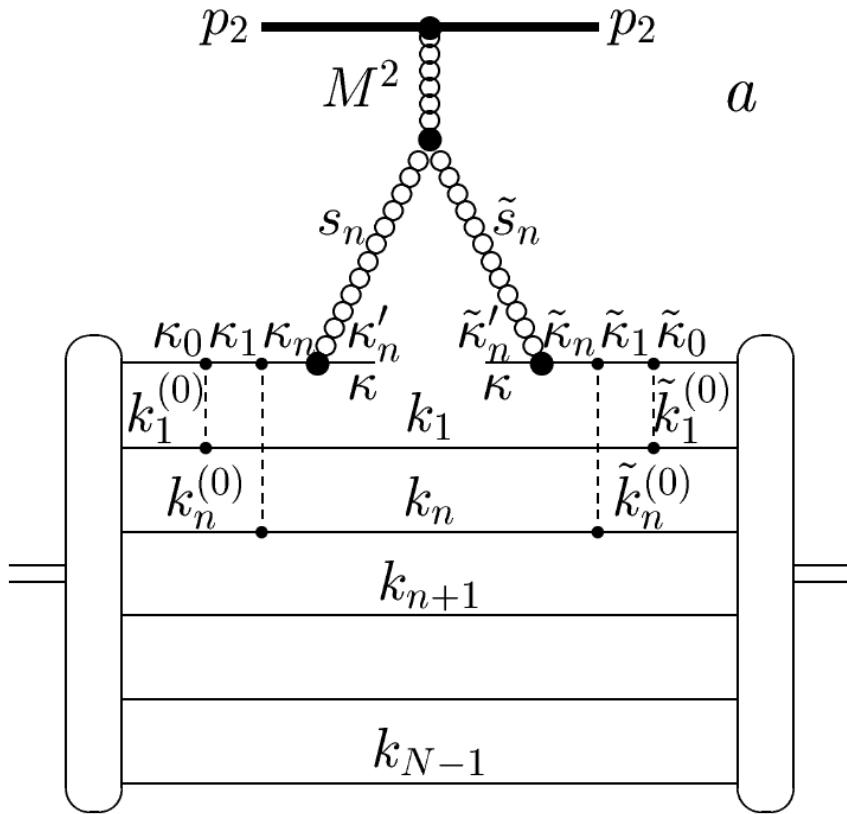

$$I_A(x) \sim \exp(-b_s x) \quad b_s \sim 6 \div 8$$

The experimental points from

*Benvenuti A.C. et al. (BCDMS collaboration)
Z. Phys. C63 (1994) 29
[^{12}C , $q^2 = 61 \text{ GeV}^2, 150 \text{ GeV}^2$].*

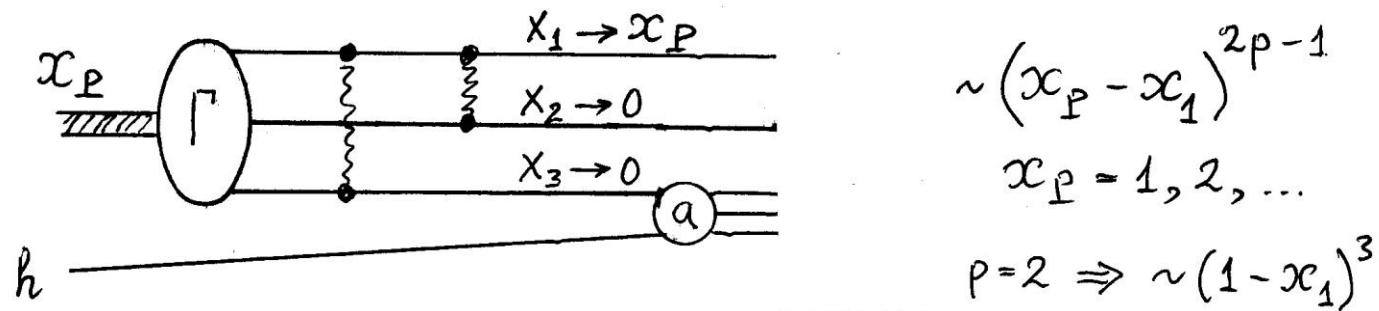

*Nikiforov N.A. et al. Phys. Rev. C22 (1980) 700
[$p+181\text{Ta} \rightarrow p + X$, $400 \text{ GeV}/c$]*

Cancellation of the direct contributions to a cumulative quark formation

$q > 3$

Transverse momentum spectra of cumulative pions

- the cumulative pion production

k_T – dependence:

*M.A. Braun, V.V. Vechernin,
Phys.Atom.Nucl. **63**, 1831 (2000)*

$$\sigma_{pion}(x, k_\perp; p) = C(p) (x_{frag} - x)^{2p-1} f_p\left(\frac{k_\perp}{m}\right)$$

$$x < x_{frag}(p) = 1/3 + p/3$$

p – the number of “donors”, stopped quarks

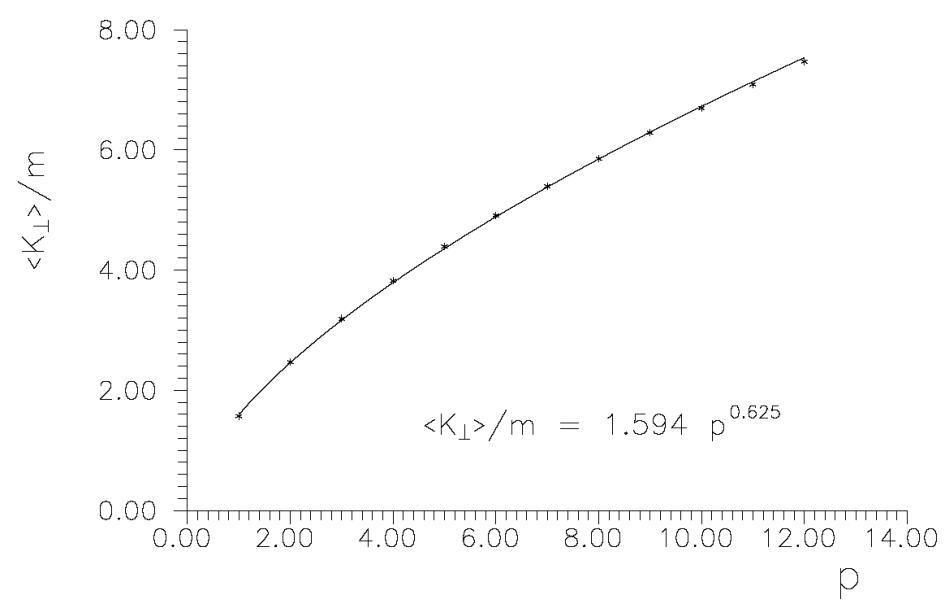

m – the constituent quark mass

$$f_p(t) = \frac{1}{\pi^p} \int \prod_{i=1}^p \frac{d^2 t_i}{(t_i^2 + 1)^2} (2\pi)^2 \delta^{(2)}\left(\sum_{i=1}^p t_i + t\right)$$

$$t = k_\perp/m, \quad t_i = k_{i\perp}/m$$

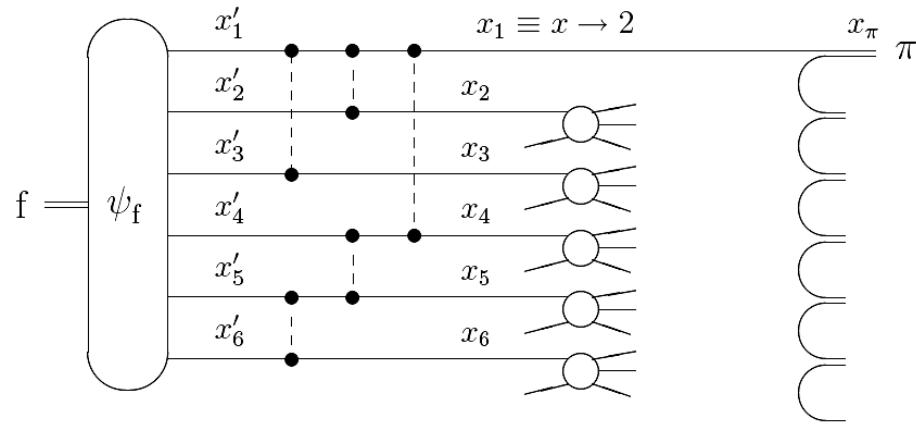

$$f_p(t) = 2\pi \int_0^\infty dz z J_0(tz) [z K_1(z)]^p$$

$$\langle |K_\perp| \rangle = pm \int_0^\infty dz K_0(z) (z K_1(z))^{p-1}$$

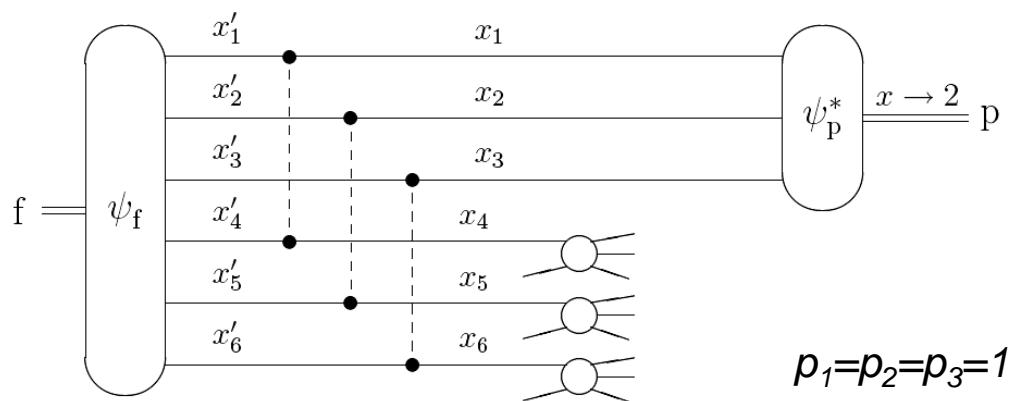

$$\langle K_\perp \rangle / m = 1.594 p^{0.625}$$

Coherent Quark Coalescence and Production of Cumulative Protons

- the cumulative pion production by hadronization of one fast quark

$$p_1 = p_2 = p_3 = 1$$

- the cumulative proton production coherent quark coalescence mechanism:
- M.A. Braun, V.V. Vechernin,
 Nucl.Phys. **B92**, 156 (2001);
 Theor.Math.Phys. **139**, 766 (2004)*

Few nucleon short-range correlations in a nucleus

*L.L. Frankfurt, M.I. Strikmann, Phys. Rep. 76, 215 (1981);
 ibid 160, 235 (1988).*

$W_j: j=1,2,3.$

$$n=n_1+n_2+n_3$$

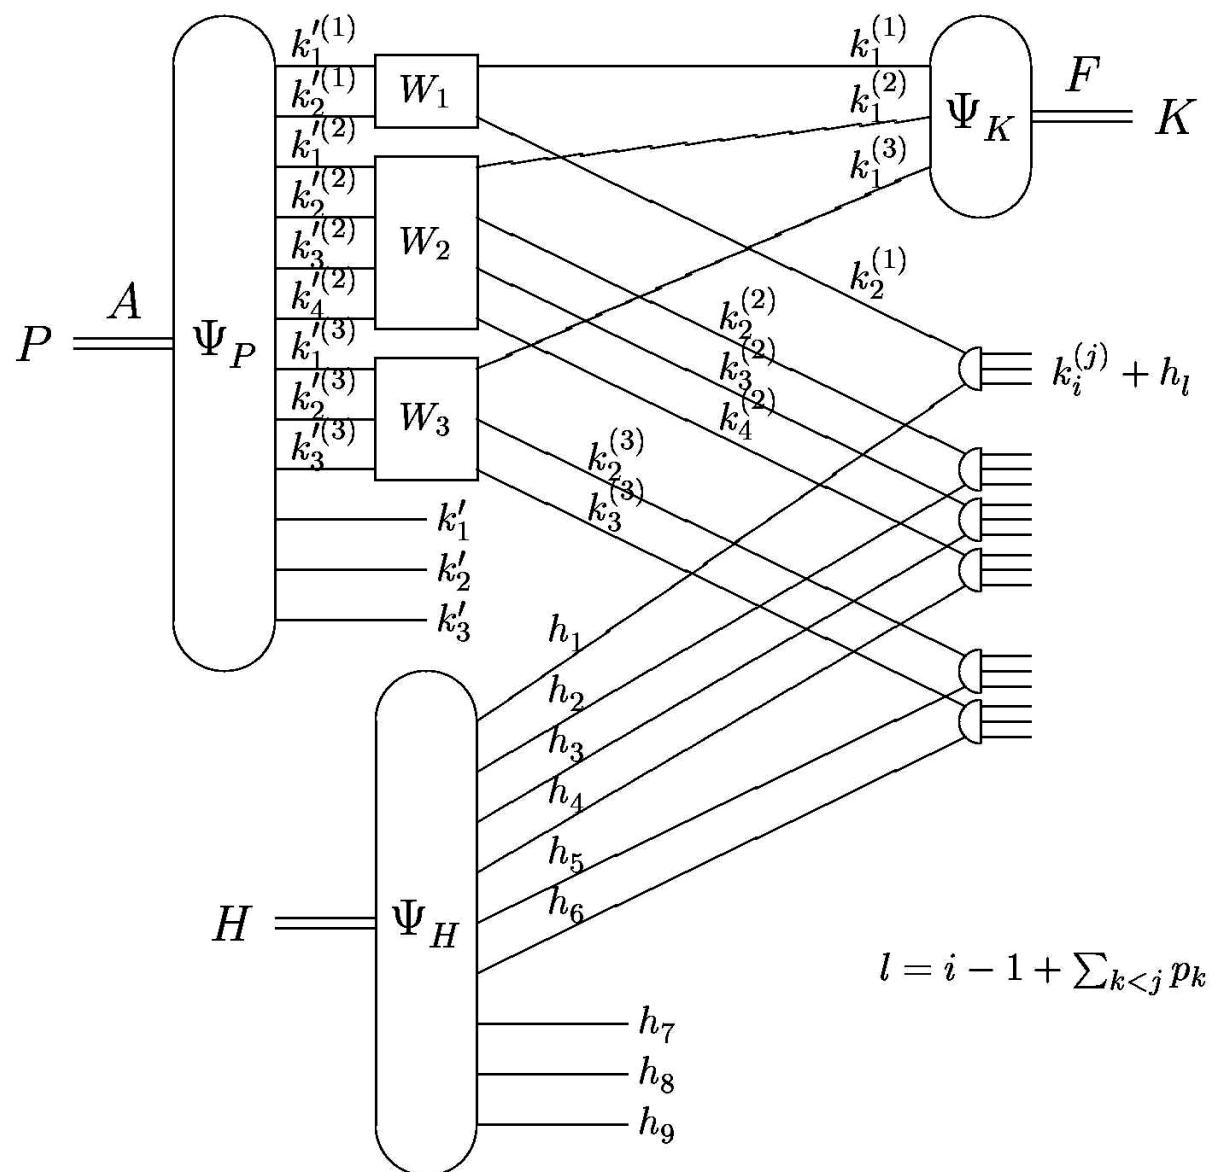

$$p_1=n_1-1$$

$$p_2=n_2-1$$

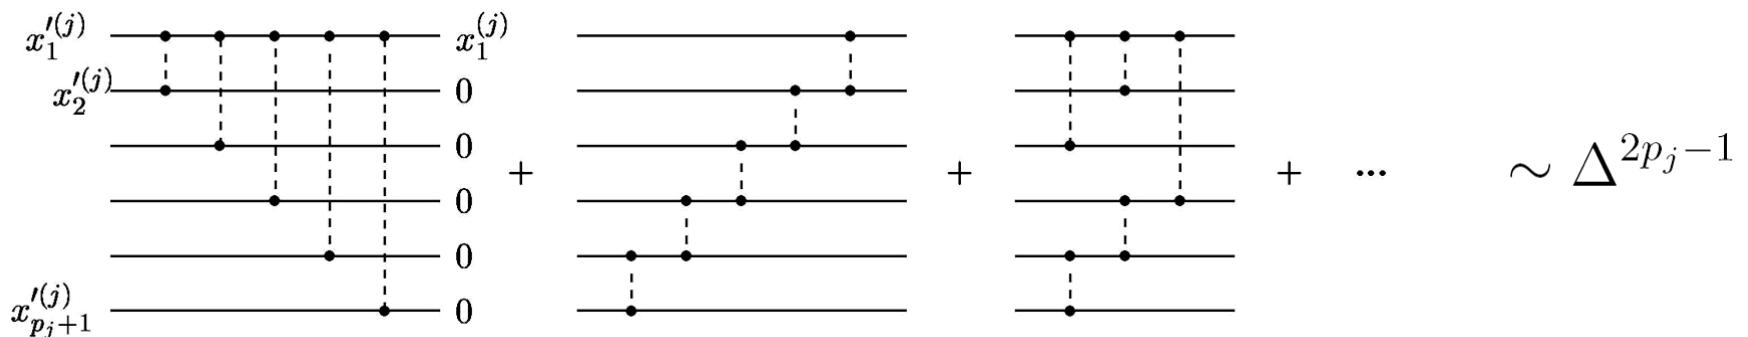

$$p_3=n_3-1$$

$$p=p_1+p_2+p_3=1+3+2=6$$

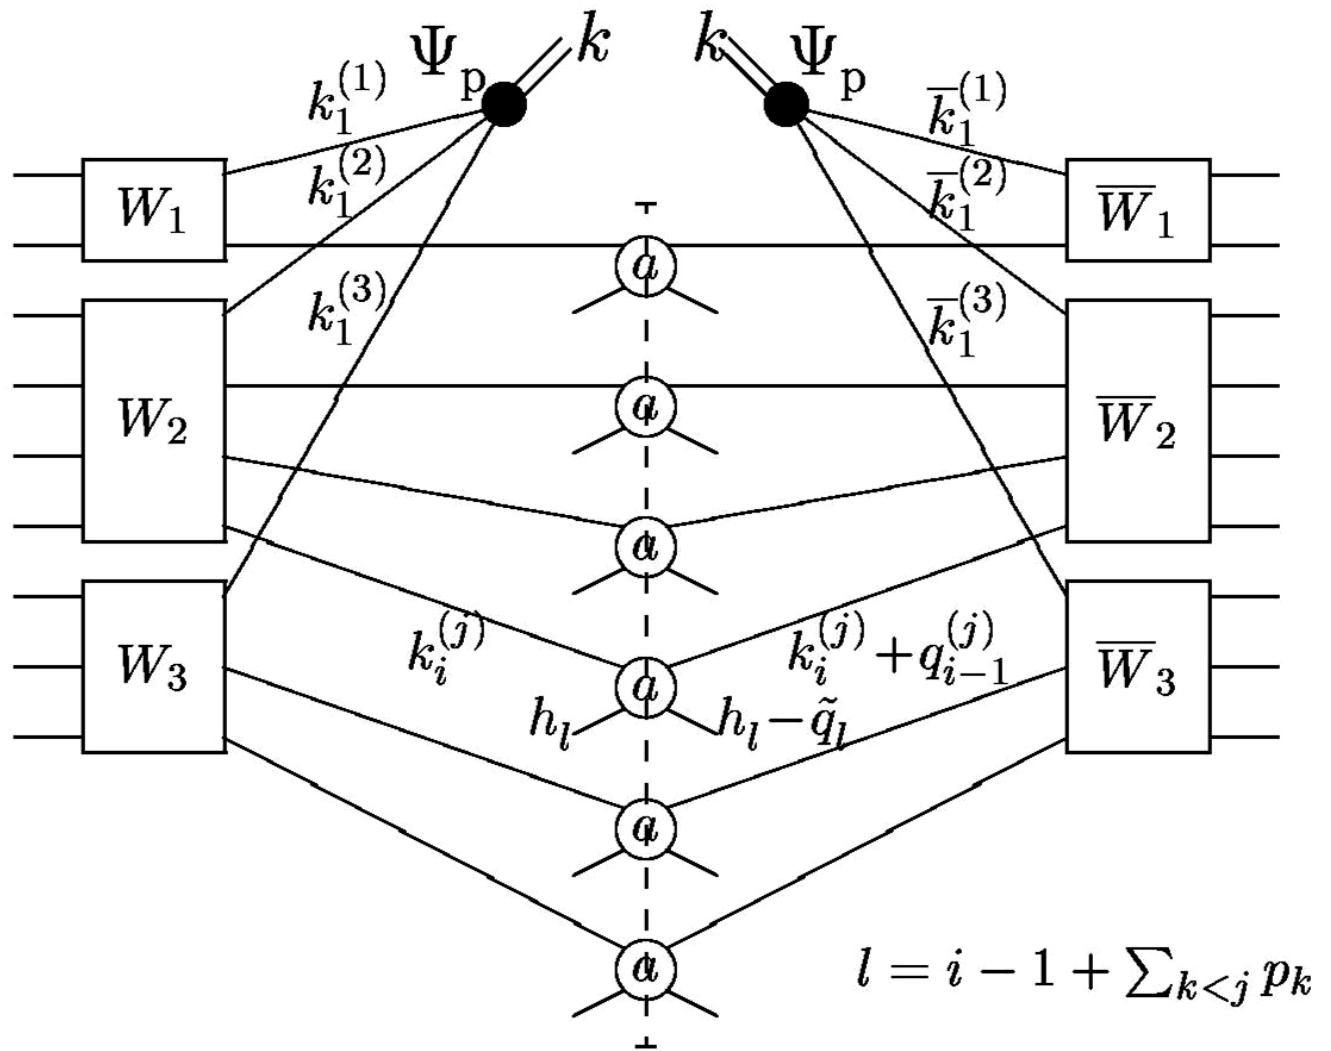

$$n=p+3=9$$

Contributions to the blobs W_j :

The examples of two types of non-diagonal contributions to the cross section of cumulative proton production:
a – all $p_j = \bar{p}_j$, *b* – some $p_j \neq \bar{p}_j$

The diagonal contribution to the cross section of cumulative proton production.

Note the presence of the interference effects also in this case!

$$\sigma_{pion}(x, k_\perp; p) = C(p) (x_{frag} - x)^{2p-1} f_p \left(\frac{k_\perp}{m} \right)$$

$$x < x_{frag}(p) = 1/3 + p/3$$

*M.A. Braun, V.V. Vechernin, Phys.Atom.Nucl. **63**, 1831 (2000)*

p=n-1

$$\sigma_{prot}(x, k_\perp; p_1, p_2, p_3) = C(p_1, p_2, p_3) (x_{coal} - x)^{2p-1} f_{p_1} \left(\frac{k_\perp}{3m} \right) f_{p_2} \left(\frac{k_\perp}{3m} \right) f_{p_3} \left(\frac{k_\perp}{3m} \right)$$

$$x < x_{coal}(p) = 1 + p/3 , \quad p = p_1 + p_2 + p_3$$

*M.A. Braun, V.V. Vechernin, Theor.Math.Phys. **139**, 766 (2004)*

p=n-3

$$f_p(t) = 2\pi \int_0^\infty dz z J_0(tz) [z K_1(z)]^p$$

$J_0(z)$ - the Bessel function, $K_1(z)$ - the modified Bessel function.

$$(2\pi)^{-2} \int f_p(|\mathbf{b}|) d^2\mathbf{b} = (2\pi)^{-1} \int_0^\infty f_p(t) t dt = 1$$

$$e^{-b_s x} = 10^2,$$

$$b_s \approx 7, \quad x = -2/3$$

Note that for $p=1$ it can be simplified to $f_1(t) = 4\pi/(t^2 + 1)^2$

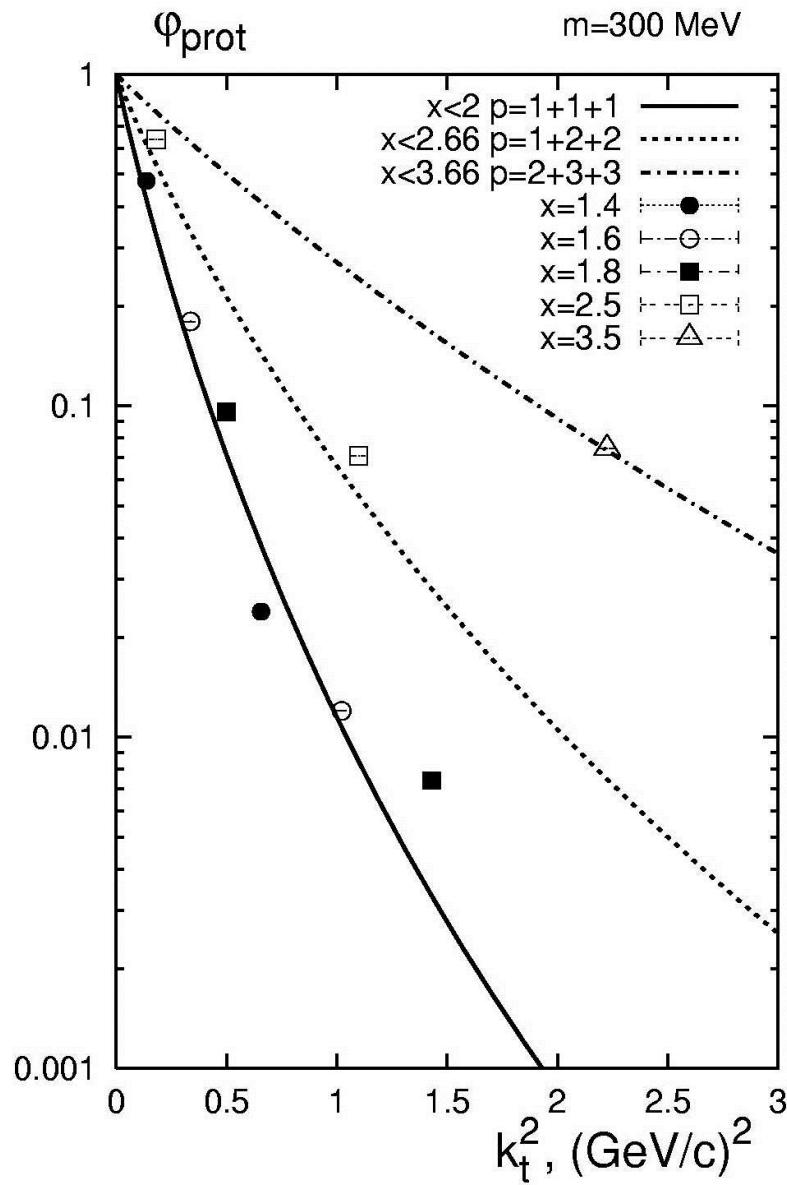

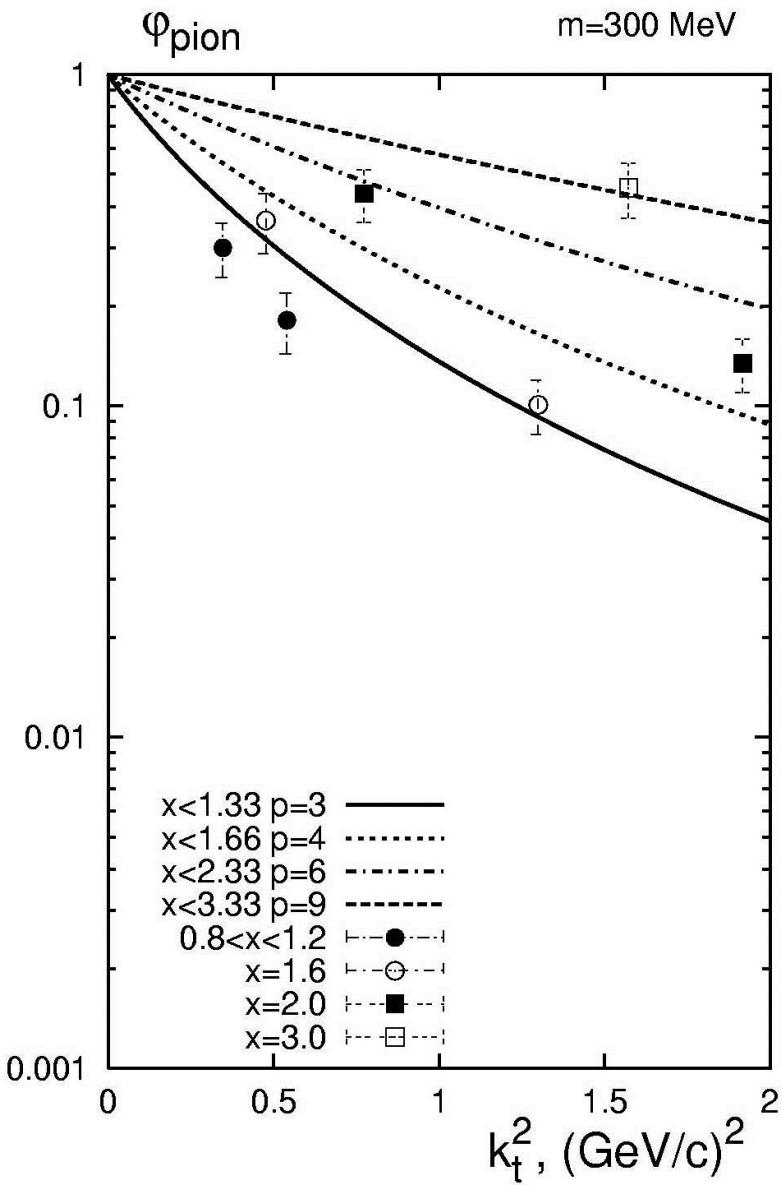

$$\varphi_{pion}(k_\perp, p) \equiv \sigma_{pion}(x, k_\perp; p) / \sigma_{pion}(x, 0; p) = f_p\left(\frac{k_\perp}{m}\right) / f_p(0)$$

$$\varphi_{prot}(k_\perp, p) \equiv \sigma_{prot}(x, k_\perp; p) / \sigma_{prot}(x, 0; p)$$

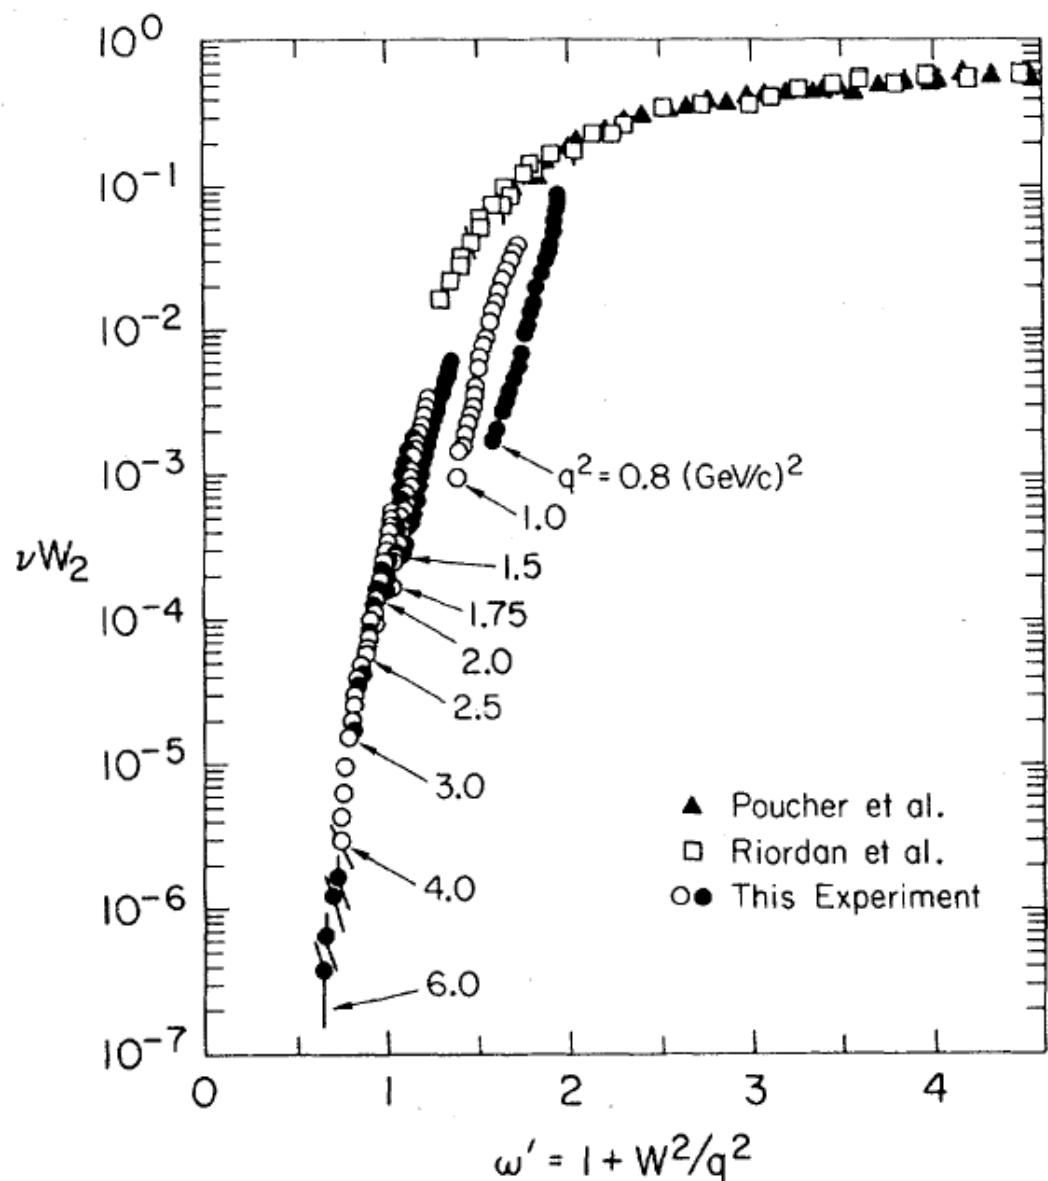

$$\varphi_{prot}(k_\perp, p) = \frac{\sum_{p_1, p_2, p_3} \delta_{p_1 + p_2 + p_3} C(p_1, p_2, p_3) f_{p_1}\left(\frac{k_\perp}{3m}\right) f_{p_2}\left(\frac{k_\perp}{3m}\right) f_{p_3}\left(\frac{k_\perp}{3m}\right)}{\sum_{p_1, p_2, p_3} \delta_{p_1 + p_2 + p_3} C(p_1, p_2, p_3) f_{p_1}(0) f_{p_2}(0) f_{p_3}(0)}$$

$$\varphi_{prot}(k_\perp, p_1, p_2, p_3) \equiv \frac{\sigma_{prot}(x, k_\perp; p_1, p_2, p_3)}{\sigma_{prot}(x, 0; p_1, p_2, p_3)} = \frac{f_{p_1}\left(\frac{k_\perp}{3m}\right)}{f_{p_1}(0)} \frac{f_{p_2}\left(\frac{k_\perp}{3m}\right)}{f_{p_2}(0)} \frac{f_{p_3}\left(\frac{k_\perp}{3m}\right)}{f_{p_3}(0)}$$

No free parameters (!) only m – the constituent quark mass: $m = 300$ MeV.

$$X^{\text{BP}} = \frac{A\sigma_N}{\sigma_A} 48^2 \pi I(R) \gamma m^2 \frac{W_0^2}{K^2}$$

$$\mathbf{q}_{1,2} = \mathbf{K}/2 \pm \mathbf{k}, \quad \bar{\mathbf{q}}_{1,2} = \mathbf{K}/2 \pm \bar{\mathbf{k}}$$

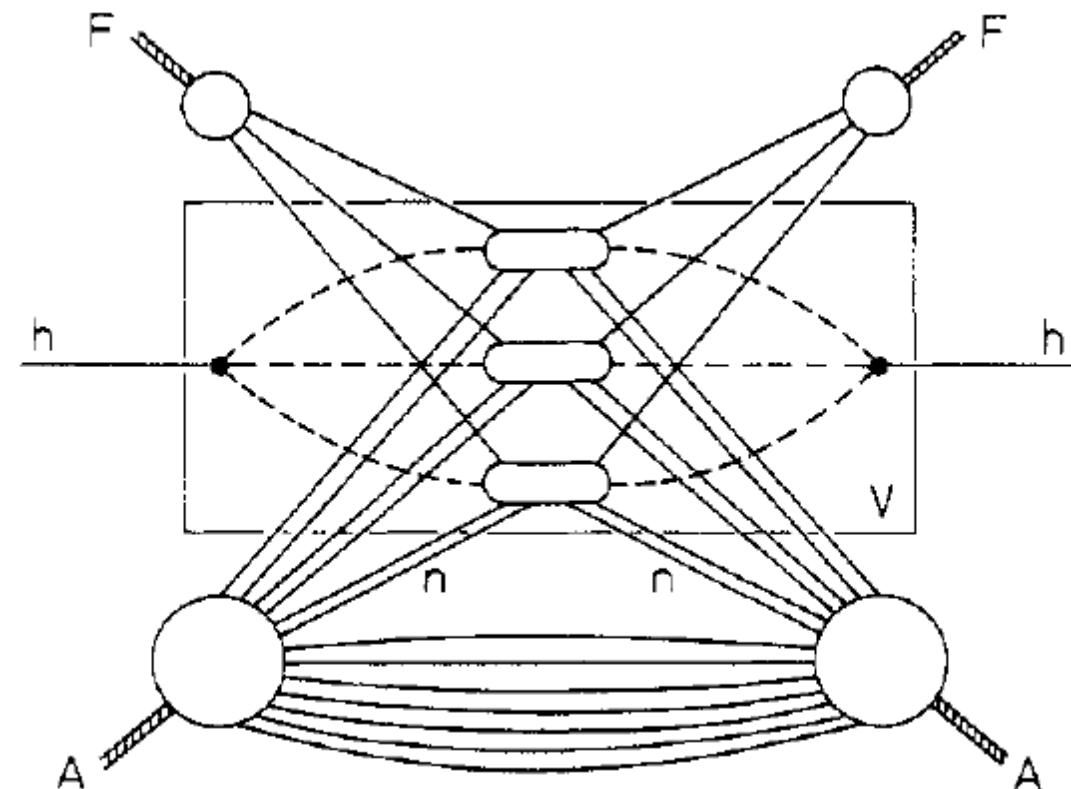

$$\begin{aligned} & \int |A_1(\mathbf{k}) + A_2(\mathbf{k})|^2 d\mathbf{k} = \\ &= \int \{|A_1(\mathbf{k})|^2 + |A_2(\mathbf{k})|^2 + A_1(\mathbf{k})A_2^*(\mathbf{k}) + A_1^*(\mathbf{k})A_2(\mathbf{k})\} d\mathbf{k} \\ & \quad \left| \int \{A_1(\mathbf{k}) + A_2(\mathbf{k})\} d\mathbf{k} \right|^2 = \\ &= \iint \{A_1(\mathbf{k})A_1^*(\bar{\mathbf{k}}) + A_2(\mathbf{k})A_2^*(\bar{\mathbf{k}}) + A_1(\mathbf{k})A_2^*(\bar{\mathbf{k}}) + A_1^*(\mathbf{k})A_2(\bar{\mathbf{k}})\} d\mathbf{k}d\bar{\mathbf{k}} \end{aligned}$$

For a real potential V the contributions
2 and 4 cancel the BP contribution 3

$$D_F = 2sF I_F, \quad I_F = (2\pi)^3 2f_F, \quad f_F = p_{F0} d^3 \sigma_F / d^3 \mathbf{p}_F$$

$$\frac{D_F^{(n)}}{2s} = \frac{(nF)!}{(n!)^F} C_A^{nF} (2m)^{1-nF} \left(\frac{d_n}{2s}\right)^F J_F^{(n)}$$

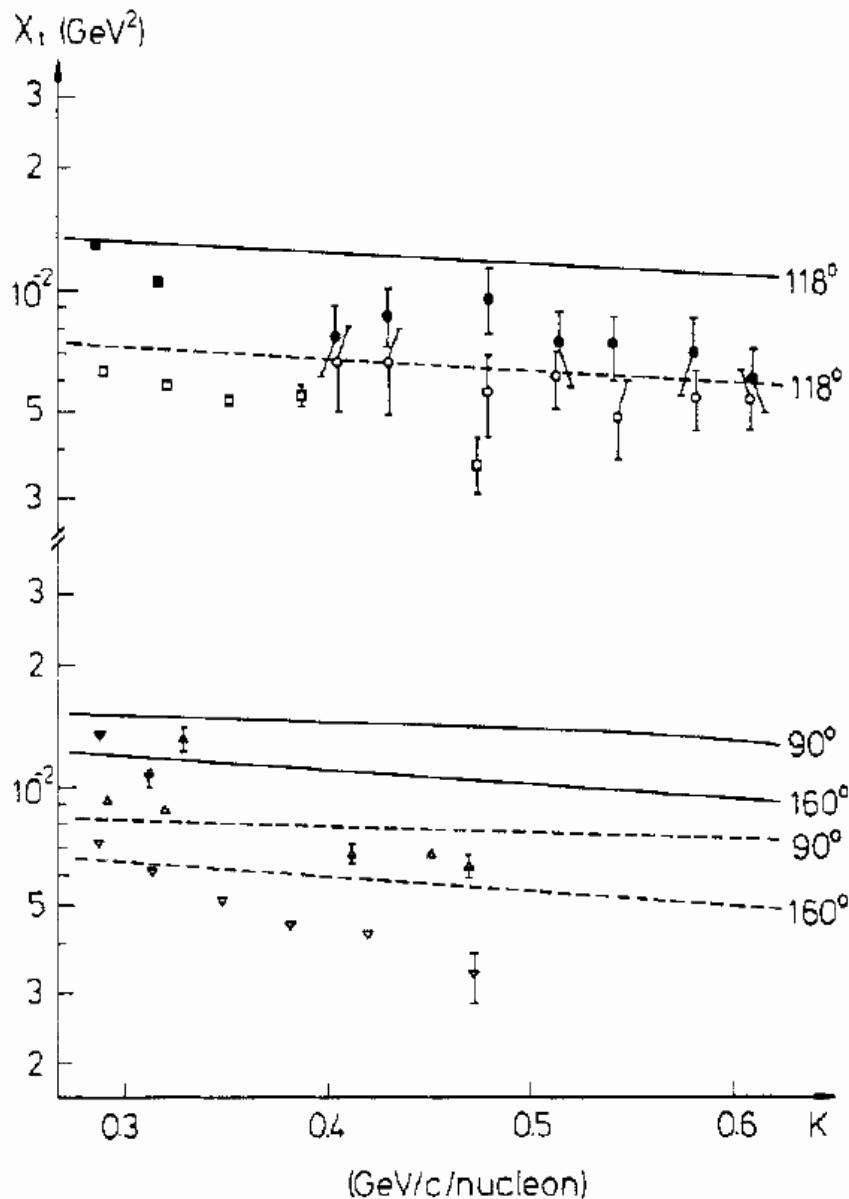

$$J_F^{(n)} = \int d^2\mathbf{b} dz_1 \dots dz_F |\psi_F(\mathbf{y}_i)|^2 \rho_A(\mathbf{b}, z_1; \dots \leftarrow n \rightarrow \dots, \mathbf{b}, z_1; \dots, \mathbf{b}, z_F; \dots \leftarrow n \rightarrow \dots, \mathbf{b}, z_F)$$

$$\mathbf{y}_i = \left(\mathbf{0}_{\perp}, \frac{k_{\perp}}{m} z_i \right)$$

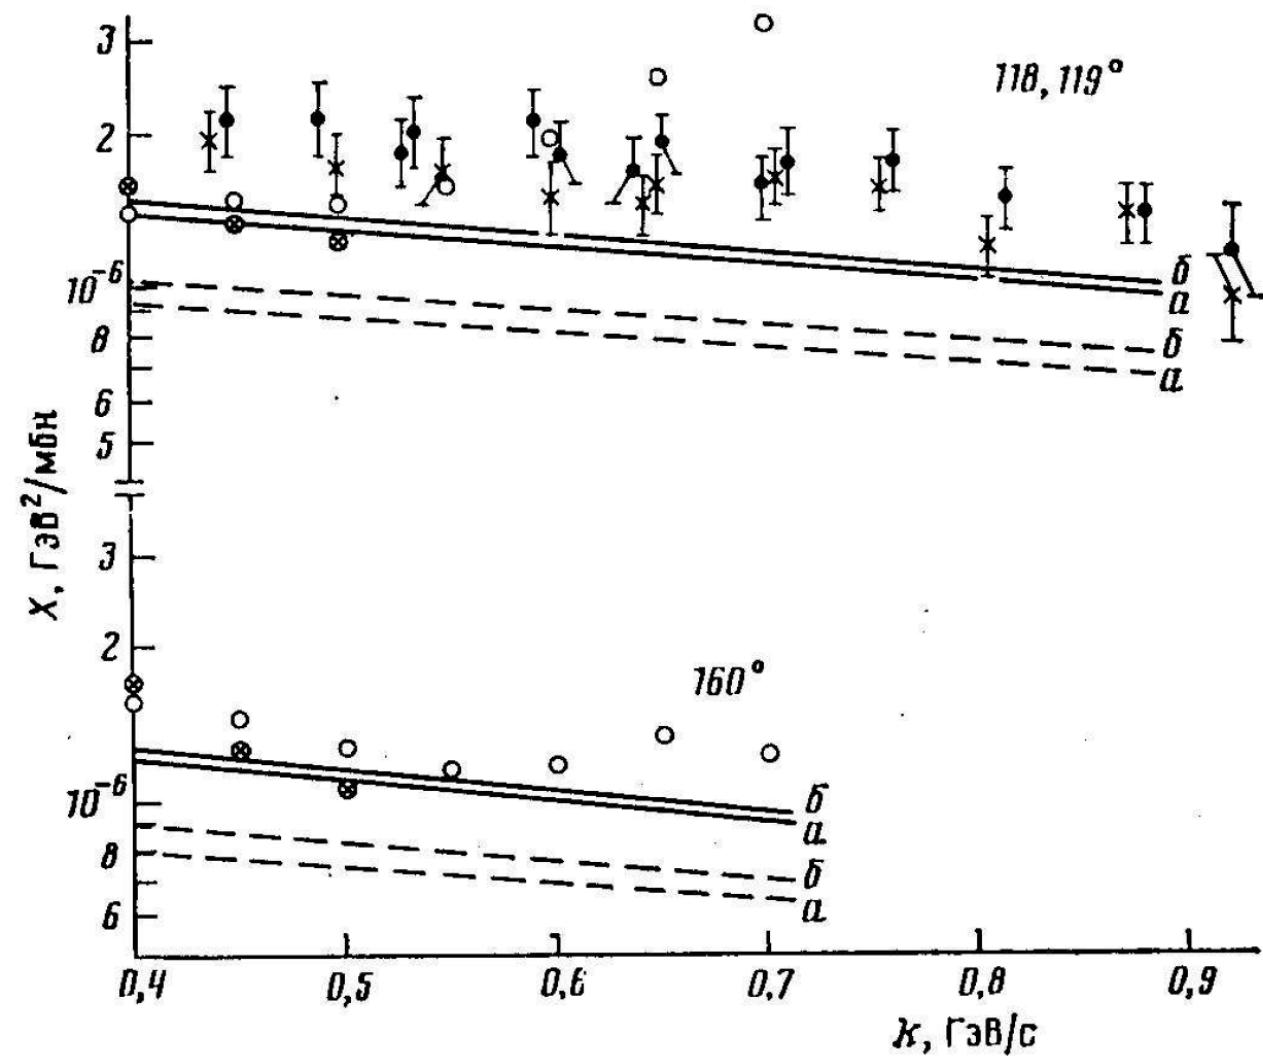

$$k_{\perp} = k_0 - k_z = (k^2 + m^2)^{1/2} - k \cos \theta.$$

k_{perp} - scaling
of the coalescence coefficient

$$[\chi_F(\mathbf{k})]^{F-1} = \frac{f_F(F\mathbf{k})/\sigma_A^{in}}{[f_1(\mathbf{k})/\sigma_A^{in}]^F} = [2(2\pi)^3 \sigma_A^{in}]^{F-1} \frac{I_F}{(I_1)}$$

The coalescence coefficient for the emission of tritium in the backward hemisphere in the lab. system, (i.e. in the cumulative area of the target nucleus fragmentation region of the process (1)). The full and broken curves are the results of our calculations with a formula, which is similar to (29) but with $n = 2$, for the target nuclei Cu and Ta, respectively. The experimental data points correspond to the production of tritium in the following reactions: \blacktriangle , \blacksquare and \blacktriangledown , on Cu for the angles 90° , 118° and 160° , \triangle , \square and \triangledown , on Ta for the same angles at the initial energy 400 GeV [10]; \bullet and \circ , on Cu and Ta for the angle 119° at the initial energy 10 GeV [2].

$$X = (I_A^{(d)}/A)/(I_A/A)^2$$
