+float impactParameters  
+float magField
```

# Cone vs Range

- A Range in R, Phi and Z covers areas that are out of question for a Seed
- A Cone shaped area contains only the required seeds

# Cone vs Range

- A Range in R, Phi and Z covers areas that are out of question for a Seed
- A Cone shaped area contains only the required seeds
- Loop only over bins covering cone

### SpacePoint

```

# Current implementation state

- The SP and the simple SP Container ☺
  - 3D array, as opposed to ATLAS design where container is a 1D array “hand tailored” into a 2D array in phi and z, with SP sorted by R in each bin
- Next step: straight line seeds iterating over phi-z slices
