## 17th International Conference on Ion Sources

Contribution ID: 37 Type: Oral presentaion

## The RHIC Polarized H<sup>-</sup> Ion Source

Wednesday 18 October 2017 15:40 (20 minutes)

A novel polarization technique had been successfully implemented for the RHIC polarized H<sup>-</sup> ion source upgrade to higher intensity and polarization. In this technique a proton beam inside the high magnetic field solenoid is produced by ionization of the atomic hydrogen beam (from external source) in the He-gas ionizer cell. Further proton polarization is produced in the process of polarized electron capture from the optically-pumped Rb vapor. The use of high-brightness primary beams and large cross-sections for charge-exchange resulted in production of high intensity H<sup>-</sup> ion beam with 85% polarization. High beam brightness and polarization resulted in 75% polarization at 23 GeV out of the (Alternating Gradient Synchronisation) AGS and 60-65% beam polarization at 100-250 GeV colliding beams in RHIC.

Authors: Dr ANATOLI, Zelenski (BNL); Dr ATOIAN, Grigor (BNL)

**Presenter:** Dr ANATOLI, Zelenski (BNL) **Session Classification:** 9th Session

Track Classification: Negative ion sources
