What is DM?

- We know of **four fundamental interactions**
- **Dark Matter does**

Gravity

Electromagnetism

Weak Force

Strong Force

What is DM?

- We know of **four fundamental interactions**
- **Dark Matter does**
 - interact **gravitationally**
 - not have any **electromagnetic interaction**
 - not interact via the **strong force** (not a baryon)
 - **perhaps** interact via the **weak force** but it is not the neutrino

What is DM?

- Dark matter is a **hugely successful theory** to explain plenty of observations
- It is **the one theory** that can successfully simulate and reproduce the universe on **all scales**:
 - Galaxy rotation curves
 - Galaxy clustering
 - Cluster collision
 - Large-scale structures
 - CMB fluctuations
 - Gravitational lensing

- Global fit of cosmological parameters, Λ CDM:
 $\rightarrow \Omega_\Lambda \approx 0.68, \Omega_{DM} \approx 0.27, \Omega_b \approx 0.05$

DM Detection

Earth

DM Detection

Earth

DM Detection

- DM annihilates in **halo** and create **cosmic rays** (**AMS, Pamela**)
- Excesses observed (positron high mass, antiproton low mass)
- **Not pointing** to sources

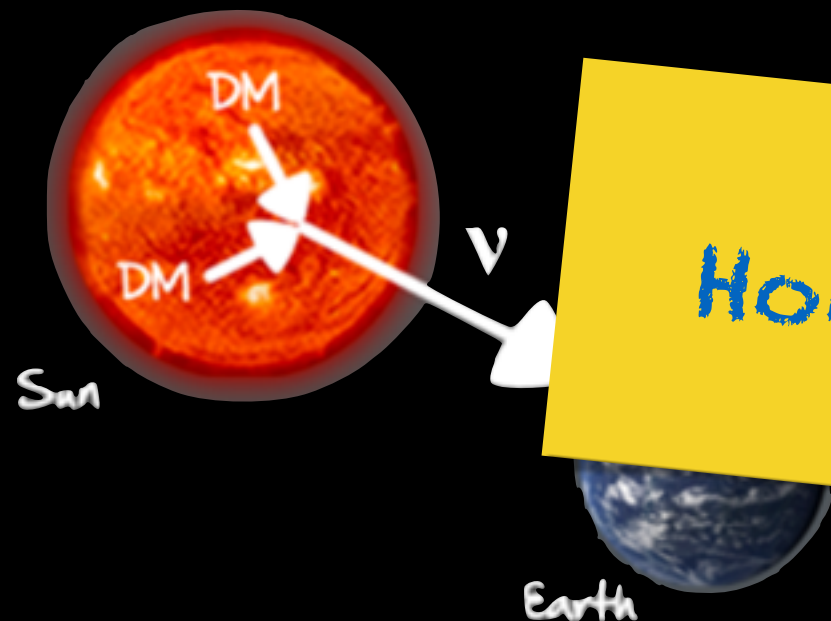

- **DM annihilates in sun** and creates neutrino detected on Earth (**IceCube**)
- Sensitivity approaching viable models

- DM annihilates in dwarf galaxies/GC creating continuous or line photon spectrum (**Fermi-LAT**)
- Interesting **excess observed**
- Bright future: HESS2, HAWC, CTA, GAMMA- 400...

DM Detection

- DM annihilates in **halo** and create **cosmic rays** (**AMS, Pamela**)
- Excesses observed (positron high mass, antiproton low mass)
- **Not pointing** to sources

Hooman, Sergio

es in **sun** and creates
ected on Earth (**IceCube**)
approaching viable models

- DM annihilates in dwarf galaxies/GC creating continuous or line photon spectrum (**Fermi-LAT**)
- Interesting **excess observed**
- Bright future: HESS2, HAWC, CTA, GAMMA- 400...

DM Detection

DM Detection

DM Detection

- **DM relic density** predicts DM candidates accessible at collider experiments
- **Only type** of experiment possibly can **create DM** laboratory
- **Independent systematic uncertainties** and **performance** compared to other searches
- DM has to be **kinematically accessible**: $\sim 1\text{-}1000\text{GeV}$

Geneviève

- **DM relic density** predicts DM candidates accessible at collider experiments
- **Only type** of experiment that possibly can **create DM in the laboratory**
- **Independent systematic uncertainties** and **performance** compared to other searches
- DM has to be **kinematically accessible**: $\sim 1\text{-}1000\text{GeV}$

DM Detection

DM Detection

DM Detection

- Detect DM as **our solar system passes through the galactic halo**
 - $v \sim 10^{-3} c$
 - Kinetic energy $\sim 100 \text{ keV}$
- Detected by recoils off **ultra - sensitive** detectors placed **deep underground**
- Roughly **1 interaction per kg per year**
- **Very stringent** cleanliness and background rejection **requirements**
- Variety of **detection methods** and targets

Direct Detection

- Momentum transfer crucial,
- Low mass difficult (as opposed to collider)

How do we connect and learn from
all three fields?

Parameterizing Dark Matter

- In a real life we need some mediator between the ‘dark World’ and the known Universe

Parameterizing Dark Matter

- In a real life we need some mediator between the 'dark World' and the known Universe

Parameterizing Dark Matter

- In a real life we need some mediator between the ‘dark World’ and the known Universe

- Leads to **known interactions**
 - scalar ($\psi\psi$),
 - pseudo scalar ($\bar{\psi}\gamma^5\psi$),
 - vector $\bar{\psi}\gamma^\mu\psi$,
 - axial-vector ($\bar{\psi}\gamma^\mu\gamma^5\psi$)
- **Interesting kinematics** and experimental **sensitivities**

Parameterizing Dark Matter

EWK style
(equal to leptons)

Vector

$$g_{\text{DM}} Z'_\mu \bar{\chi} \gamma^\mu \chi$$

Besides very low DM masses
DD wins clearly over collider

Axial-Vector

$$g_{\text{DM}} Z''_\mu \bar{\chi} \gamma^\mu \gamma^5 \chi$$

DD and collider are equal in
overall sensitivity but probe different
regions of parameter space

mass based
(Yukawa)

Scalar

$$g_{\text{DM}} S \bar{\chi} \chi$$

DD and collider are equal in
overall sensitivity but probe different
regions of parameter space

Pseudo-Scalar

$$g_{\text{DM}} P \bar{\chi} \gamma^5 \chi$$

No limits from DD (only from ID).
Collider provides limits similar
to scalar couplings

DM can only be discovered by combining these approaches

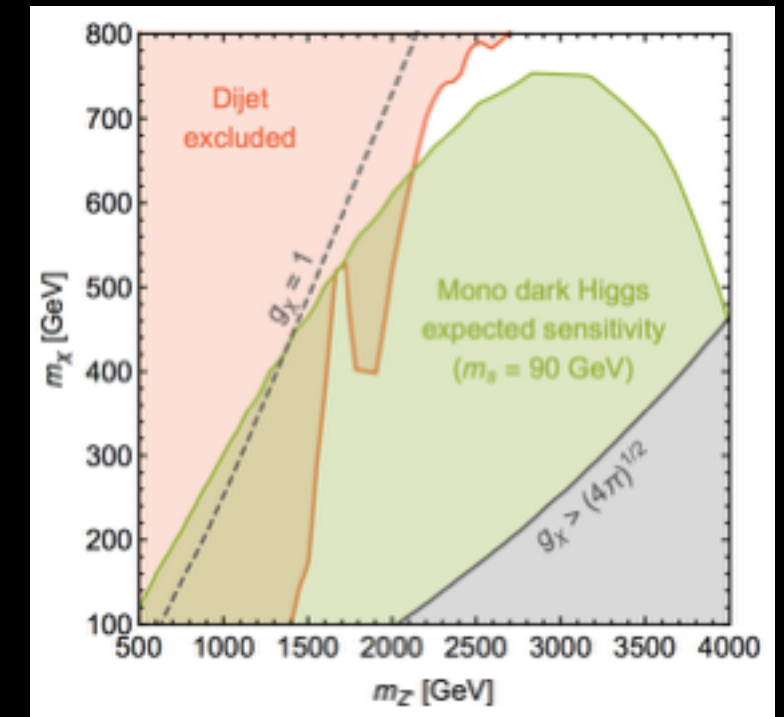

Parameterizing Dark Matter

- In a real life we need some mediator between the ‘dark World’ and the known Universe

- Discovery of DM will be **discovery of two particles**
 - dark matter itself
 - the dark mediator
- More appropriate to **interpret results in terms of m_{DM} and m_{Med}**

Interplay

- Continue to provide **viable models** and **identify unexplored phase space**
- Provide original **ideas across experimental** approaches & provide leadership

The (near) future

Future Ideas in Dark Matter

ADMX Experiment

- **ADMX** - another 2nd gen dark matter experiment
- Axions convert to microwave photons (GHz)
- Targets the entire 1-10 GHz region over 6 years
- If the QCD axion with a mass in that region makes up most of the local dark matter density, ADMX has a very good chance of finding it

ADMX Experiment

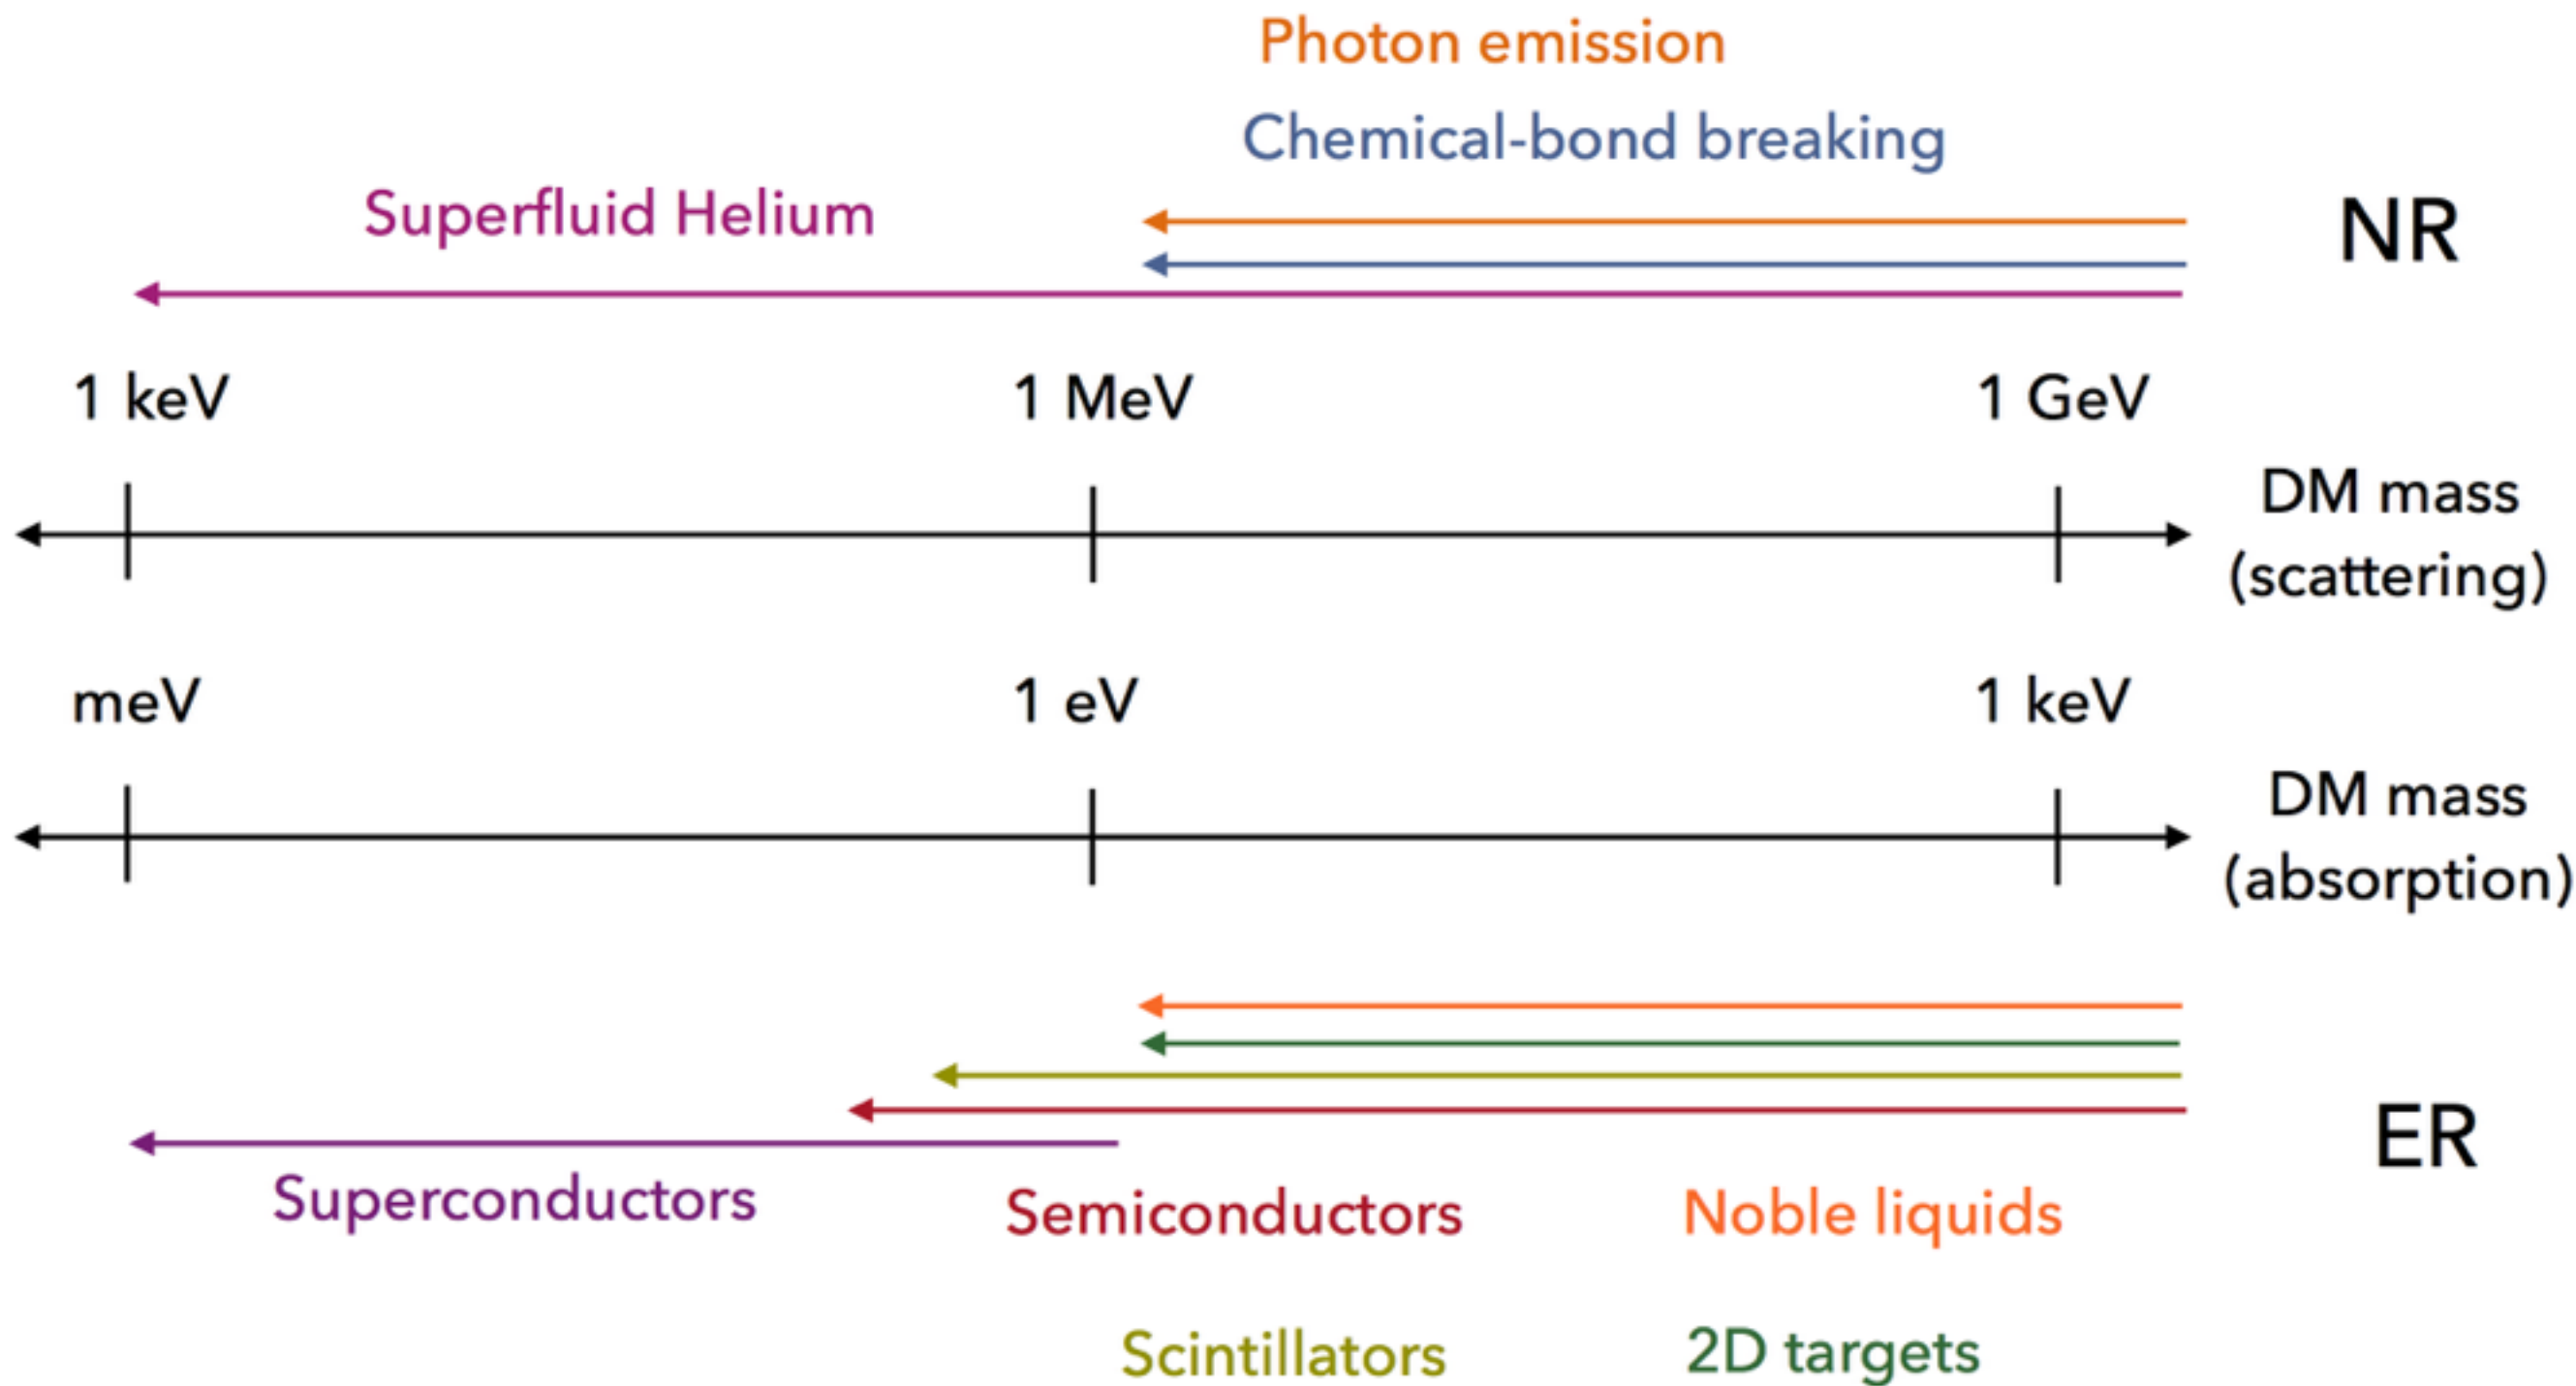

- OPerating at since January 2017
- ADMX G2 will cover much of the plausible axion mass range
- At ~660 MHz and scanning upwards, discovery can happen any day

Going beyond

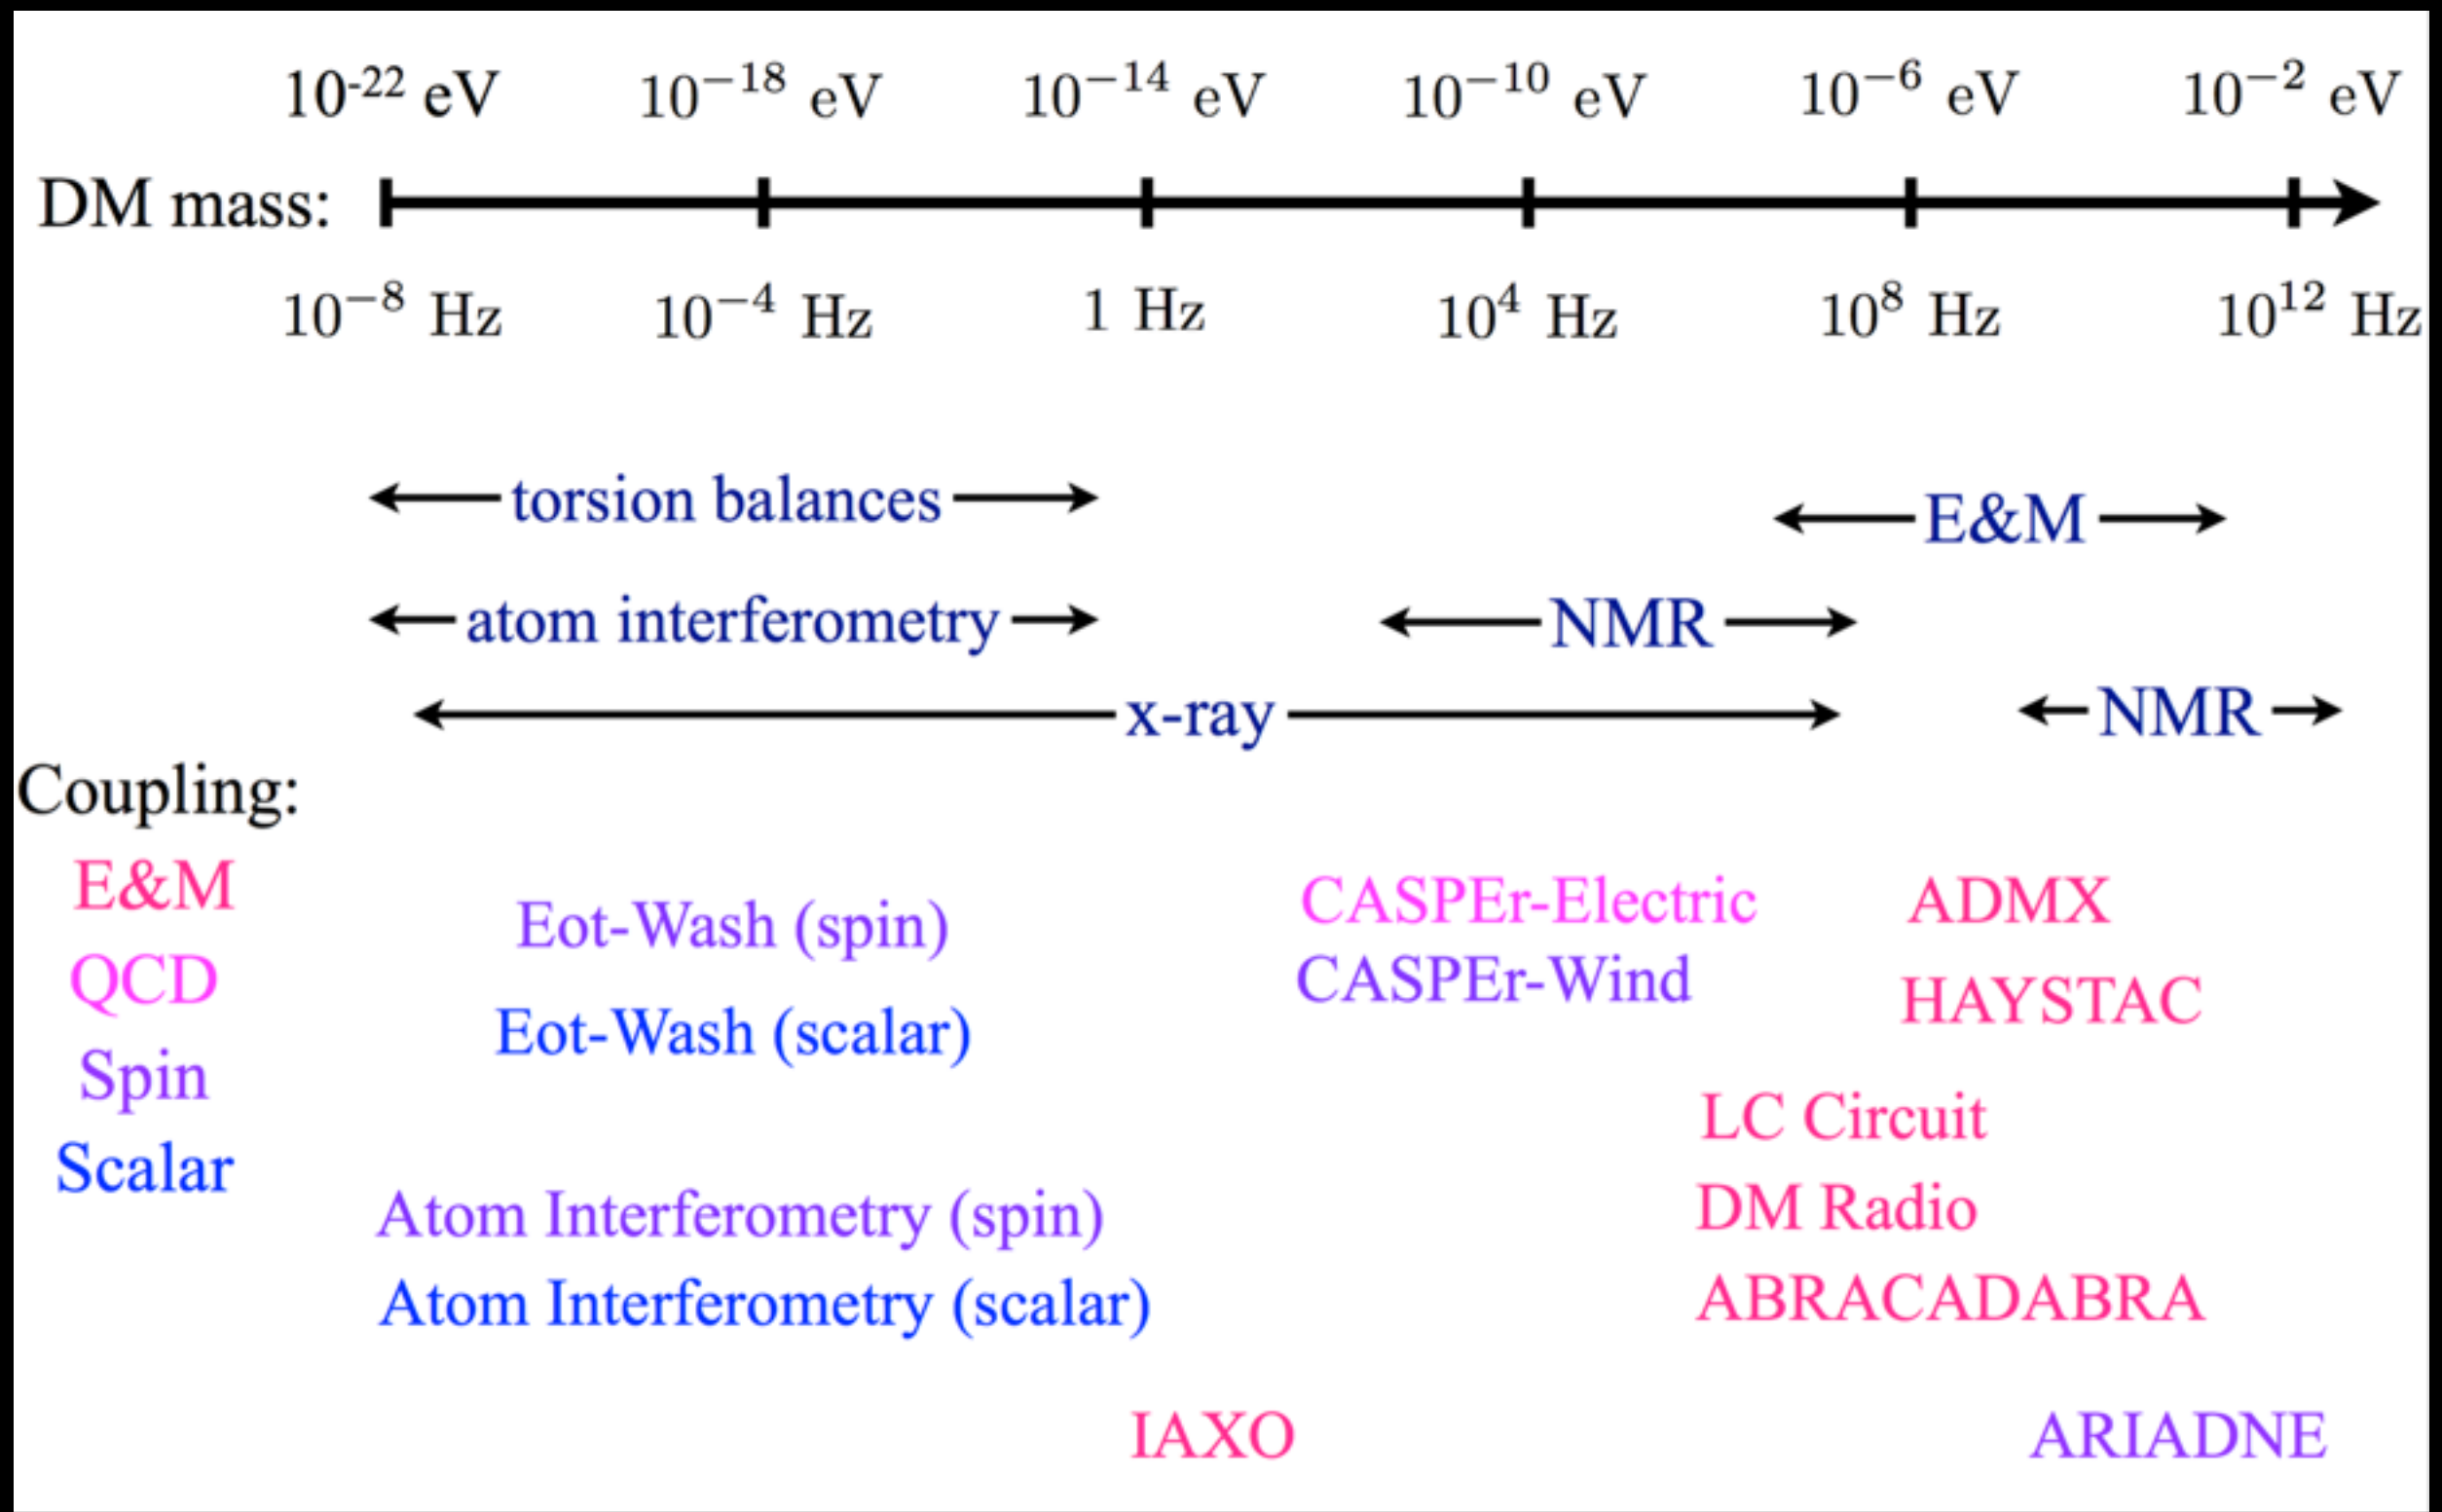

The mass and cross section span many orders of magnitude

New Ideas for WIMP detection

Explosion of new ideas over last few years

New Idea for Axion/Dark Photons

EXP	target material	readout	science	budget	timescale
scintillating bubble chambers	Xe, Ar, C ₆ F ₆ , H ₂ O	light heat (bubble)	GeV WIMPS	\$200K	10 kg Xenon 2 yr program to test with coherent scattering CENNS
CYGNUS HD-10	SF ₆ 4He	charge cloud tomography, directional sensitivity	GeV WIMPS	R&D \$250k 1 m ³ ~ \$450k 10 m ³ ~ \$3M	R&D 1 yr 1 m ³ : 2yr 10 m ³ : 2ry
DAMIC	Si	charge	GeV WIMPS	\$3M	start 2019-2020 the construction R&D going now
news-G	H, He	charge	GeV WIMPS		installing 140 cm sphere at SNOLAB in 2018
liquid xenon TPC	Xe	charge only	sub-GeV DM - ER	\$3M	1 yr design 1 yr deploy 10kg @surf 1 yr commission and run
SENSEI	Si	charge	sub-GeV DM - ER	\$1.2M	2 yrs to build the 100g experiment starting (could start now)
Doped germanium with internal amplification	Ge semiconductor	charge 0.1 eV (nuclear)	sub-GeV DM - ER	R&D 600k 10 kg → 1.5M 100kg → 10M	R&D +3yr
2d graphene Ptolomey-G3	graphene cube	charge(G-FET) (300 B channel count @ 1 kHz)	sub-GeV DM - ER	\$200k needed for wafer fab for demonstrator (1e4 cm ²)	1 yr fab 1 yr data ready for the "generation 1"
single photon detector with TES readout	GaAs(Si)	light	sub-GeV DM - ER	R&D 200k project 600k	R&D 1eV thr the project would on on SuperCDMS 2020
NaI/ScI cooled crystals	NaI/ScI	light	sub-GeV DM - ER	R&D - \$250k project \$100k	R&D - 3 yr project 2020 w/TES
superconducting AL cube	Al superconductor	TES meV energy resolution.	sub-GeV DM - ER		+10 yr science program
LHe detector	He	phonon	sub-GeV DM - NR	3M	2018 R&D 2020 final design 2022 start data taking
field ionization helium	He	phonon	sub-GeV DM - NR	R&D \$725k	R&D 3 years
color centers	crystals (example: CaF)	light	sub-GeV DM - NR		R&D going on now
bubble chambers PICO	wide range of target nuclei. This is what makes them unique.	heat (bubbles)	spin dependent	lowest cost per ton of any target mass pico-500 - ~\$3M	just finished pico-60 pico40L in Fy17 (funded) pico 500 coming
emulsions (news-dm)	high position resolutions nuclear emulsions (silver bromide crystals + I C O N H S)	imaging with optical microscopes, and validation of candidates with X-ray microscope	beat neutrino floor	—	R&D phase complete. Technical test to confirm negligible background running now.

Summary

- DM is out there and will **transform our understanding of the universe**
- LHC is running, DD, and indirect detection are improving rapidly – **the field is being transformed now**
- **DM has to be discovered in several fields** to be confirmed and **measured**
- Not necessarily imply vanilla dark matter: **SuperWIMPs, WIMPless DM may be warm,....**
- **In the best of all worlds:** Multiple discoveries (direct detection, the LHC, indirect detection) & constraints of the DM properties & DM astronomy
- **If no discovery:** “ultimate” WIMP DM detectors might at least be able to disprove the WIMP hypotheses (still valuable)
- Plethora of new ideas and experiments

Backup

- Testing Fermi-LAT excess and inclusive analyses using collider data
- Inclusive search has significantly better expected sensitivity

- Testing Fermi-LAT excess and inclusive analyses using collider data
- Inclusive search has significantly better expected sensitivity
- Excluding already part of the phase space
- More 13 TeV data will be very exciting

Interplay

Derive constraints from
astrophysical measurements

One model...

to rule them all.
