## HIJING: Heavy Ion Jet Interaction Generator

Xin-Nian Wang and Miklos Gyulassy, *Physical Rev. D* 44, 3501(1991)

- A microscopic transport model
- Build to work at LHC energy
- A two component model for beam parton interactions
- In each collision
  - Jet Production ( $p_T > p_0$ ) (Main source of hadrons at LHC energies)  
Jet cross section ( $\sigma_{jet}$ )
  - String interactions ( $p_T < p_0$ ) (FTF/DPM)  
soft parton cross section ( $\sigma_{soft}$ )

HIJING uses

- Eikonal formalism to determine the number of wounded nucleons
- PYTHIA 5.3 to generate kinetic variables for each hard scattering (high  $p_T$ ).
- JETSET 7.2 for jet fragmentation.

# Parameters of HIJING code for A+A collisions

- The jet cross section  $\sigma_{jet}$ .
  - Cut off parameter  $p_0$ .
  - Parton Distribution function (PDF) ★ new
  - QCD running coupling ★ new
- The soft parton cross section  $\sigma_{soft}$ .
- Parton ( $\alpha_{g(q)}$ )Shadowing. ★ new

- $\sigma_{soft}, p_0$  are determined once for all
  - Tune  $p + p$  inelastic and total cross sections.
- For  $A + A$  collisions, one needs
  - Exact QCD running coupling  $\alpha_s$ .
  - Adjust Parton shadowing  $\alpha_{g(q)}$

# The main improvements

## HIJING 1.383

- The Duke-Owen (1984) parameterizations of parton distribution functions are used.

- QCD Coupling

$$\alpha_s = \frac{1}{\beta_0 L_\Lambda}$$

$$L_\Lambda = \ln(Q^2/\Lambda), \beta_0 = 11 - 2/3n_f$$

- Parton shadowing

$$\alpha_a(r_i) = s_{q(g)} \frac{4}{3} \sqrt{1 - r_i^2/R_A^2}$$

$$r_i = \sqrt{x_i^2 + y_i^2}$$

$$s_{q(g)} = 0.17 - 0.23$$

## Improved HIJING

- Martin-Stirling-Throne-Watt (2009) of parton distribution functions are used.

- QCD coupling (A. Vogt, Comp. Phys. Comm.170, 65 (2005))

$$\frac{d\alpha_s(Q^2)}{d \ln(Q^2)} = -\beta_0 \alpha_s(Q^2) - \beta_1 \alpha_s(Q^2)$$

- Parton shadowing

$$\alpha_A(r_{ij}) = s_{q(g)} \left(A^{\frac{1}{3}} - 1\right) \frac{5}{3} \left(1 - \frac{r_{ij}^2}{R_A^2}\right)$$

$$r_{ij} = \sqrt{(b_x + x_i - x_j)^2 + (b_y + y_i - y_j)^2}$$

$$s_{q(g)} = 0.068 - 0.0328c + 0.0109 c^2$$

$$s_{q(g)} = 0.068 - 0.048c + 0.063 c^2 - 0.014 c^3$$

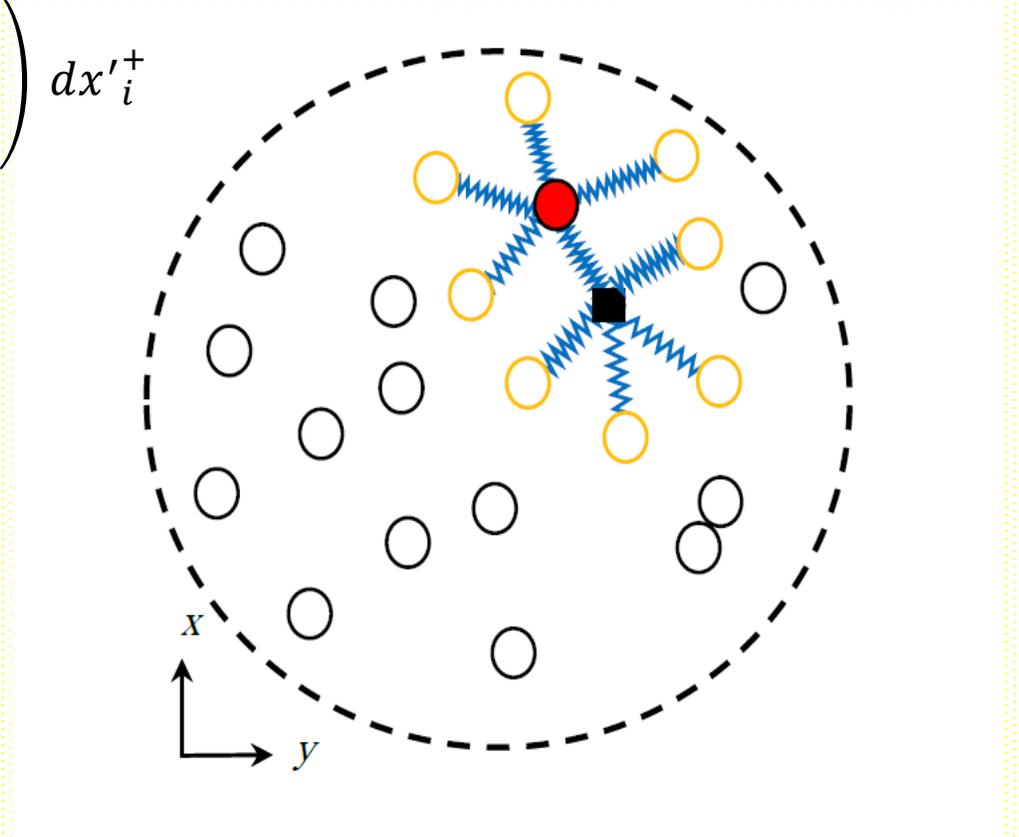

# Nucleon shadowing in ImHIJING

$$P(x'_i) \propto \prod_{i=1}^{N_A} \exp\left(-\frac{\left(x'_i - \frac{1}{N_A}\right)^2}{d^2}\right) \delta\left(1 - \sum_{i=1}^{N_A} x'_i\right) dx'_i$$

$$d = \frac{\delta}{N_A}$$

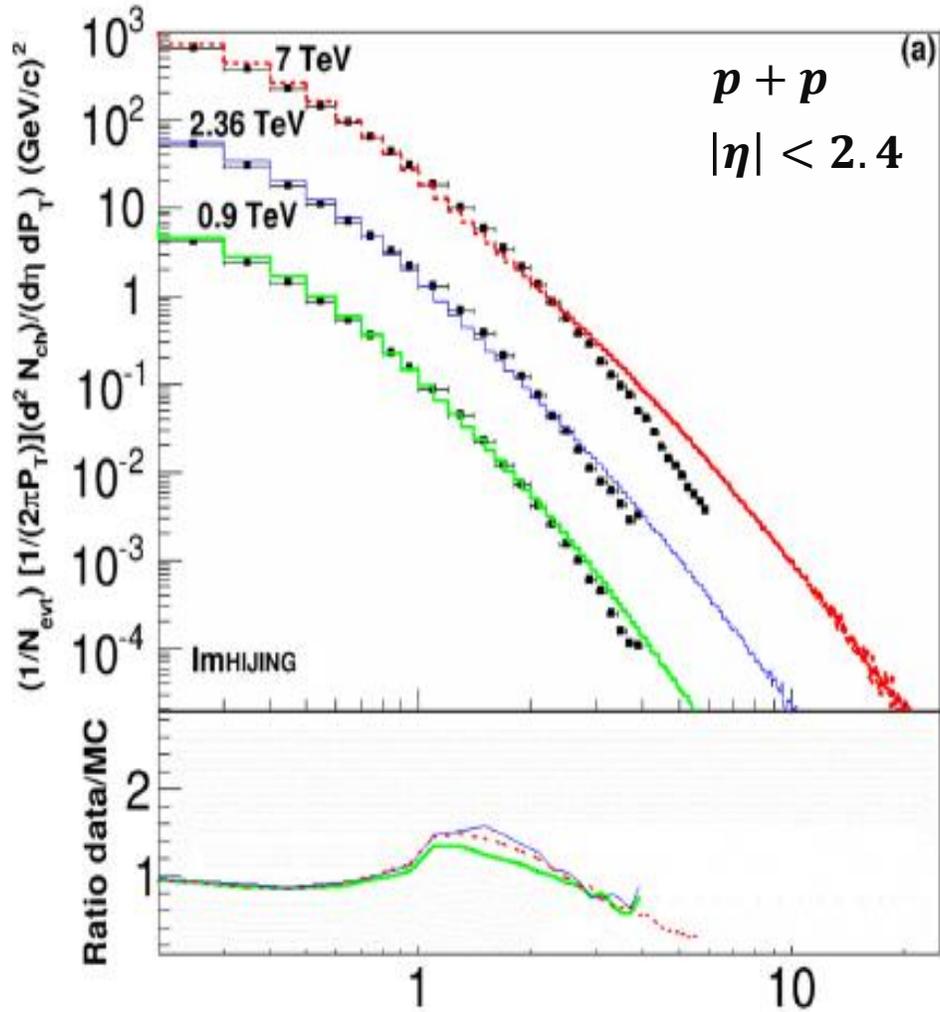

$$\delta(c) = 0.1 + 2c\left(1 - \frac{3}{4}\sqrt{c}\right) \star \text{new}$$

$$r_{ij} = \sqrt{(b_x + x_i - x_j)^2 + (b_y + y_i - y_j)^2}$$

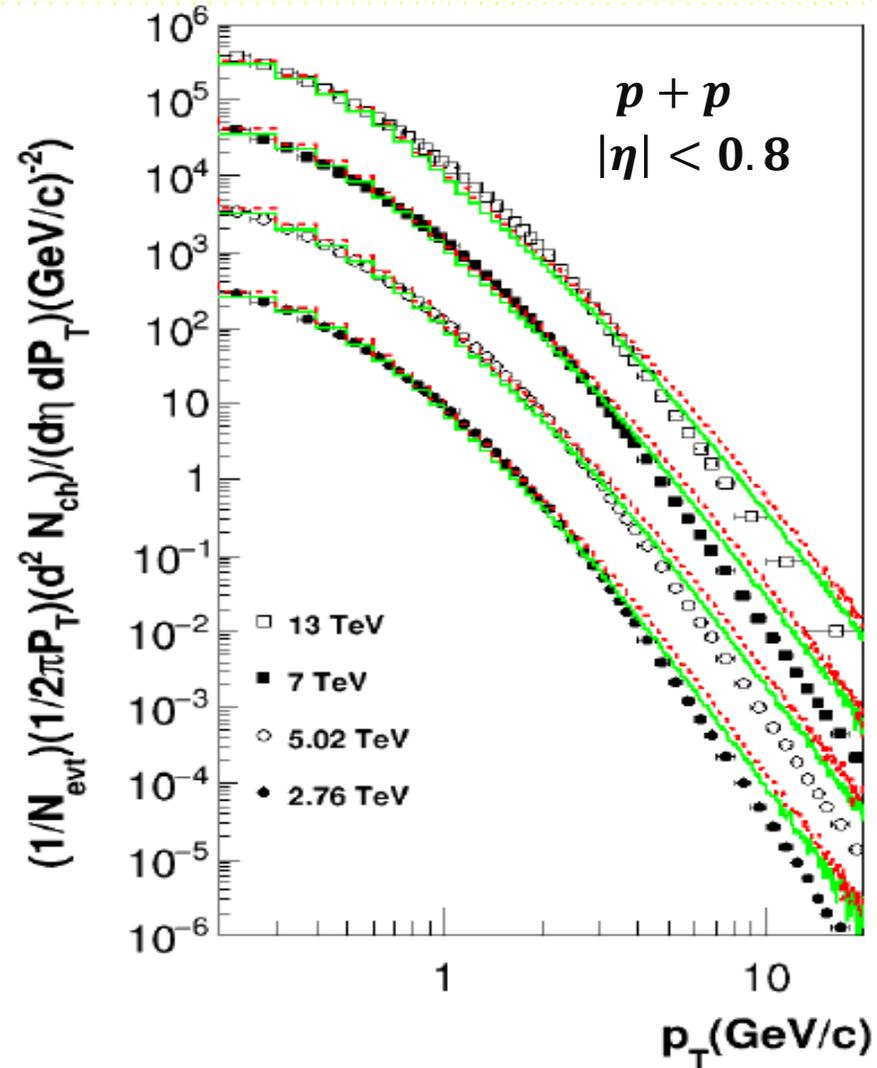

The results of the improved HIJING codes at LHC energies

# Exact QCD running coupling calculations

NO FIT

# Conclusions

- ✓ Improvements of HIJING code are
  - Tabulated Martin-Stirling-Throne-Watt (2009) parton distribution functions are implemented.
  - Exact QCD running coupling is used.
  - Nucleon shadowing becomes impact-parameter dependent.
  - Parton shadowing becomes impact-parameter dependent.
  
- ✓ Transverse momentum spectra are reproduced for
  - ✓  $p + p$  collisions at  $\sqrt{s_{NN}} = 2.76, 5.02, 7$  and 13 TeV
  
- ✓ Centrality dependence of charged particle yield are well accounted for
  - ✓ Pb+Pb collisions data at  $\sqrt{s_{NN}} = 2.76$  TeV.
  - ✓ Pb+Pb collisions data at  $\sqrt{s_{NN}} = 5.02$  TeV
  
- ✓ HIJING parameters are constrained.
