

# Impact of Measured Out-of-Spec IT FQ Terms on Dynamic Aperture

Y. Nosochkov, Y. Cai (SLAC)

R. De Maria, M. Giovannozzi (CERN)

*91st HiLumi WP2 Meeting, 11 April 2017*

**LARP**

# Outline

- Introduction
  - Out-of-spec IT FQ terms from measurements
  - New IT FQ model for tracking simulations
- Impact of out-of-spec FQ terms on DA at collision energy
  - Round and flat optics
- Impact of out-of-spec FQ terms on DA at injection energy
- Conclusions

# IT FQ measurements

## E. Todesco et al, 28-Feb-2017 WP2 meeting

- We have observed in few model large values for the  $a_4$  and  $b_5$  due to geometric field errors
  - These components are present already in the room temperature measurements [see S. Izquierdo Bermudez at HL LHC meeting in Paris 2016]
  - MQXFS1:  $a_4$  of -6.5 units,  $b_5$  of 2.8 units
  - MQXFS3:  $a_4$  of 3.7 units,  $b_5$  of -3.2 units
- Caveat: early phase of short models, different coils, field quality should improve
  - But we have no understanding of the origin
  - And we also saw similar values for HQ (large  $a_4$  and  $b_5$ )
  - These multipoles go above the possibility of correction with the magnetic shimming (max 0.8 of  $a_4$ ,  $b_5$  cannot be corrected since magnetic shimming acts on order 3 and order 4)
  - Today we have a random and uncertainty  $a_4$  and  $b_5$  of 0.57 and 0.42 units respectively (one sigma)
  - I would suggest to see the impact of increasing these values by a factor 2, 3 and 4 

- Measured uncertainty and random  $a_4$  and  $b_5$  are larger than specified, and potentially may not be reduced
- (u/r)  $a_4$ ,  $b_5$  values:
  - Nominal:  $a_4 = 0.65$ ,  $b_5 = 0.42$
  - Actual: may be 2-4 times larger
- Study the impact on DA if the (u/r)  $a_4$ ,  $b_5$  are increased to:
  - $a_4 = 2.0$ .  $b_5 = 1.5$  (or more)

# IT FQ model with quad end field

(S.I. Bermudez, E. Todesco, “MQXF Fringe Field Expectations”  
HiLumi LHC-LARP meeting, May 2015)

- In previous studies the IT model did not explicitly include the effect of quad fringe FQ
- The new model splits each IT quadrupole into 3 parts: the long “body” (constant B) and two soft fringe ends (connection and non-connection sides), each having its own FQ table (the end FQ is based on field integral)

Figure 3-14: Sketch of baseline for triplet powering (trims not shown)

# Evolution of IT FQ spec (collision energy)

Colored cells show changes since "IT\_errortable\_v3"

Values within red line border in "IT\_errortable\_v66\_5" are reduced for larger DA

"ITcs\*v5" and "ITnc\*v5" are for the connection and non-connection sides

The new FQ is similar to "IT\_errortable\_v4"

New larger b14m

The larger (u/r) a4 and b5 will be applied to the "ITbody\_errortable\_v5"

Collision	IT_errortable_v4			IT_errortable_v66_5 (optimized)			ITbody_errortable_v5			ITcs_errortable_v5		ITnc_errortable_v5

# Tracking simulations set-up

- SixTrack
  - HLLHCV1.0 round and flat optics at 7 TeV, and injection optics at 450 GeV
  - $10^5$  turns, 60 error seeds, 30 particle pairs per amplitude step ( $2\sigma$ ), 11 x-y angles
  - Tune: 62.31, 60.32 (collision) and 62.28, 60.31 (injection)
  - Normalized emittance: 3.75  $\mu\text{m-rad}$
  - Arc errors and corrections included
  - IT correctors are ON in IR1 & IR5 and OFF in IR2 & IR8
- FQ error tables for IT, D1, D2, Q4, Q5 magnets
  - “ITbody\_errortable\_5”, “ITcs\_errortable\_v5”, “ITnc\_errortable\_v5”, “D1\_errortable\_v1\_spec”, “D2\_errortable\_v5\_spec”, “Q4\_errortable\_v2\_spec”, “Q5\_errortable\_v0\_spec”
  - a2 and b2 are set to zero to simulate linear correction
- Beam-beam is not included

# Outline

- Introduction
  - Out-of-spec IT FQ terms from measurements
  - New IT FQ model for tracking simulations
- Impact of out-of-spec FQ terms on DA at collision energy
  - Round and flat optics
- Impact of out-of-spec FQ terms on DA at injection energy
- Conclusions

# DA evolution with IT FQ

## DA<sub>min</sub>

Nominal (u/r) a4 = 0.65, b5 = 0.42

> 1σ DA reduction with new FQ compared to the previous spec “IT\_errortable\_v66\_5” (where some high order terms are reduced) and optimized IP1-IP5 phase advance

## DA<sub>ave</sub>

Round collision optics, all IT correctors ON,  
(u/r) a4 = 0.65, b5 = 0.42

Round

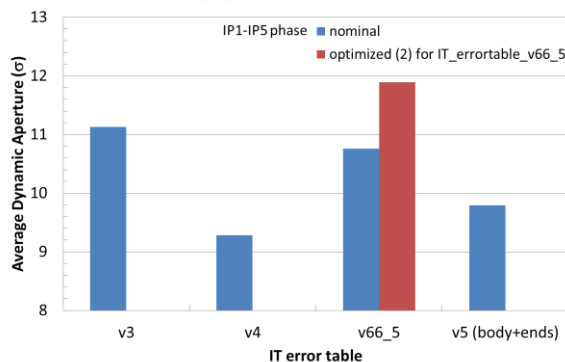

Flat collision optics, all IT correctors ON,  
(u/r) a4 = 0.65, b5 = 0.42

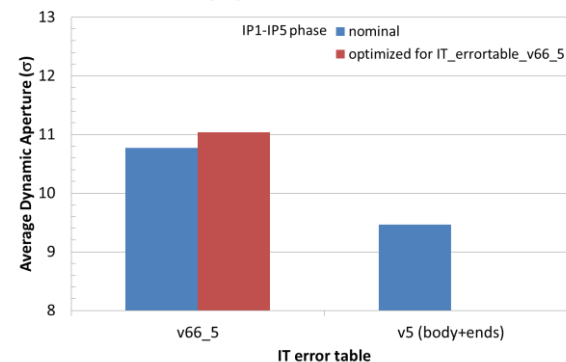

Flat

Round collision optics, all IT correctors ON,  
(u/r) a4 = 0.65, b5 = 0.42

Flat collision optics, all IT correctors ON,  
(u/r) a4 = 0.65, b5 = 0.42

# Impact of large a4 and b5 in the new FQ

- With (u/r) a4 = 2.0, b5 = 1.5 and IT correctors ON, the DAmin is reduced by  $0.4\sigma$ - $0.6\sigma$ , and DAave by  $\sim 0.1\sigma$
- Much stronger impact at larger a4, b5

Round

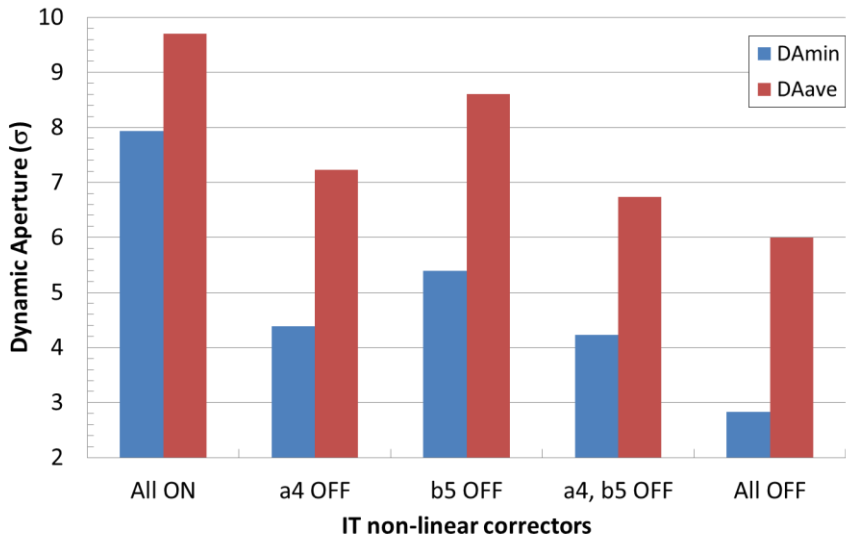

Flat

# Impact of IT correctors at larger a4, b5

- With (u/r) a4 = 2.0, b5 = 1.5 and the corresponding IT correctors OFF, the DA<sub>min</sub> / DA<sub>ave</sub> are  $\sim 4\sigma / 7\sigma$  (round) and  $\sim 2\sigma / 6\sigma$  (flat)
- The DA is more sensitive to a4 corrector than to b5 corrector

Round collision optics, IT\*errortable\_v5,  
(u/r) a4 = 2.0, b5 = 1.5, nominal IP1-IP5 phase advance

Round

Flat collision optics, IT\*errortable\_v5,  
(u/r) a4 = 2.0, b5 = 1.5, nominal IP1-IP5 phase advance

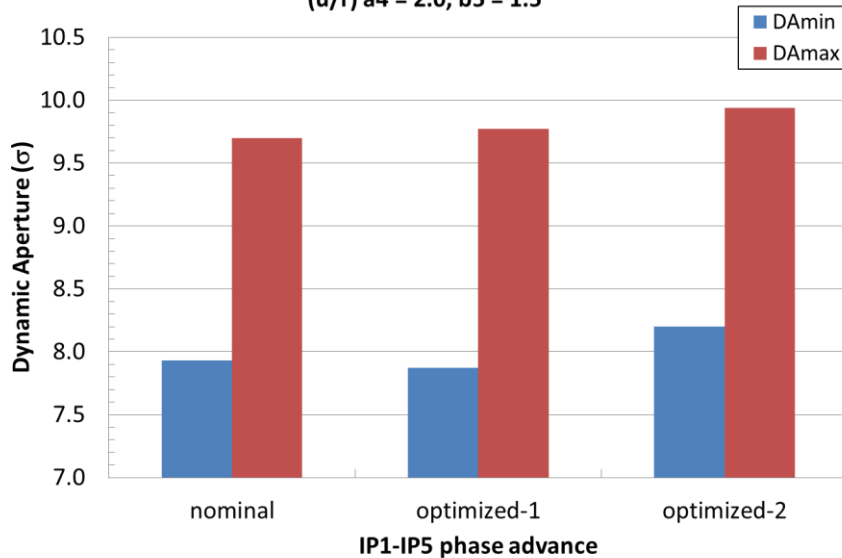

Flat

# DA with previously optimized IP1-IP5 phase advance

- Little improvement with the previously optimized IP1-IP5 phase advance (for IT\_errortable\_v66\_5) and the new IT FQ, where (u/r) a4 = 2.0, b5 = 1.5
- Optimal IP1-IP5 phase is sensitive to the IT FQ → optimization may need to be redone

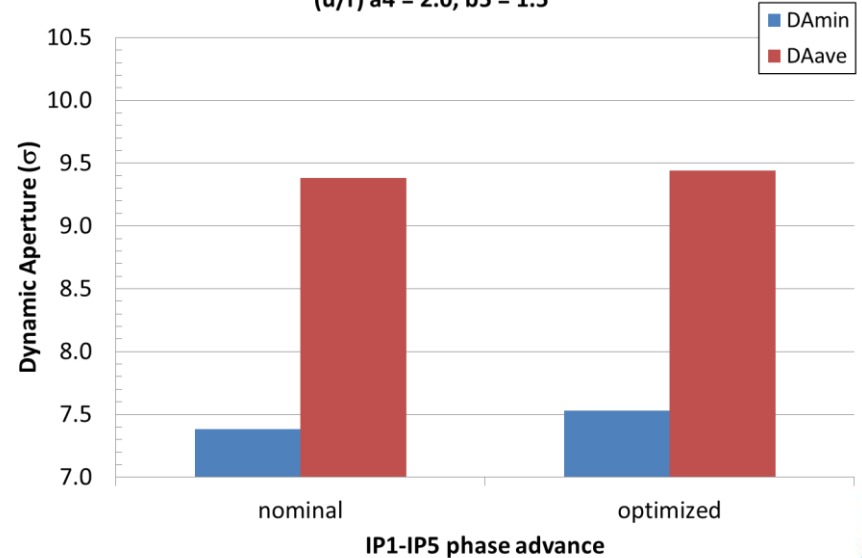

Round collision optics, IT\*errortable\_v5, all IT correctors ON,  
(u/r) a4 = 2.0, b5 = 1.5

IP1-IP5 phase advance

Round

Flat collision optics, IT\*errortable\_v5, all IT correctors ON,  
(u/r) a4 = 2.0, b5 = 1.5

IP1-IP5 phase advance

Flat

# DA with previously optimized high order an, bn terms

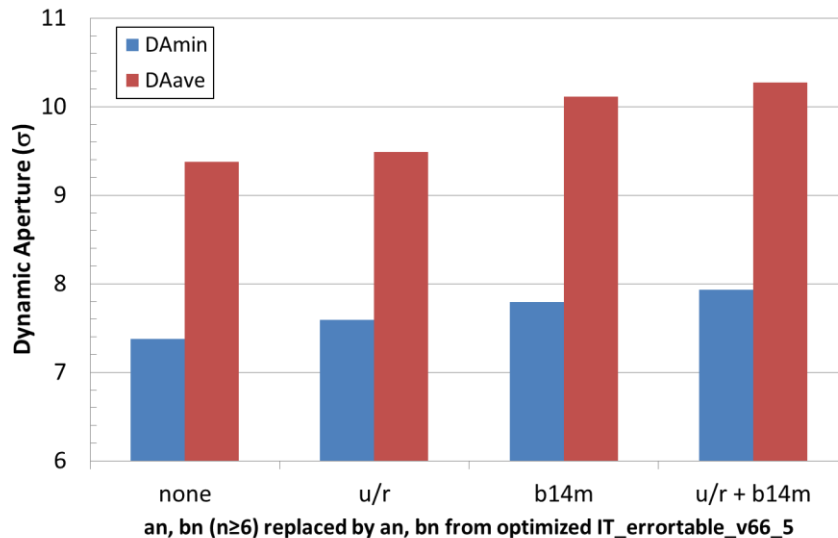

- DA is increased up to  $\sim 1\sigma$  when b14m and high order u/r terms are reduced to values in “IT\_errortable\_v66\_5” (b14m is reduced from -0.87 to -0.1675, and some  $n \geq 6$  u/r terms are reduced by 20-50%), where (u/r)  $a_4 = 2.0$ ,  $b_5 = 1.5$

Round collision optics, IT\*errortable\_v5, all IT correctors ON,  
(u/r)  $a_4 = 2.0$ ,  $b_5 = 1.5$ , nominal IP1-IP5 phase advance

Round

Flat collision optics, IT\*errortable\_v5, all IT correctors ON,  
(u/r)  $a_4 = 2.0$ ,  $b_5 = 1.5$ , nominal IP1-IP5 phase advance

Flat

# Summary of possible DA improvements at collision

- The DA with the larger a4, b5 could be improved by
  - Re-optimizing the IP1-IP5 phase advance
  - Reducing some of the high order terms of the new IT FQ

# Outline

- Introduction
  - Out-of-spec IT FQ terms from measurements
  - New IT FQ model for tracking simulations
- Impact of out-of-spec FQ terms on DA at collision energy
  - Round and flat optics
- Impact of out-of-spec IT FQ terms on DA at injection energy
- Conclusions

Colored cells show changes since “IT\_errortable\_v3”

Uncertainty / random terms have not changed (except a3)

“ITcs\*v5” and “ITnc\*v5” are for the connection and non-connection sides

New larger b6m

The larger a4 and b5 will be applied to the “ITbody\_errortable\_v5”

# DA evolution with IT FQ at injection

- Nominal (u/r)  $a_4 = 0.65$ ,  $b_5 = 0.42$
- No DA reduction at the nominal IP1-IP5 phase advance, but almost  $1\sigma$  lower DA if compared to the DA with previous FQ and optimized phase advance

# Impact of large a4 and b5 at injection

- Small impact on DA with the new IT FQ and (u/r) a4, b5 increased up to a4 = 4.0, b5 = 3.0

# DA at injection with previously optimized IP1-IP5 phase advance

- Almost the same level of DA improvement with the new IT FQ when using the previously optimized IP1-IP5 phase advance (for IT\_errortable\_v66\_5)
- Low sensitivity to a4 and b5

# Conclusions

- Sixtrack simulations with the large (u/r) a4 and b5 terms of the IT FQ at collision energy show that
  - Reduction of minimum DA can be on the order of  $0.5\sigma$
  - The impact of the large a4, b5 is significantly increased if the corresponding IT correctors are OFF
  - The previously optimized IP1-IP5 phase advance does not significantly improve the DA with the new IT FQ (body + end field)
  - Impact on the flat optics DA is somewhat worse compared to the round optics
  - Options for improving the DA may include a re-optimization of the IP1-IP5 phase advance and a modest reduction of high order an, bn terms
- Simulations at injection energy show that
  - DA is not sensitive to the a4, b5 in the studied range
  - The previously optimized IP1-IP5 phase advance provides similar DA improvement with the new IT FQ and larger (u/r) a4, b5 as with the previous IT FQ
