

2HDM $PZ2II$ model study for $t\bar{t} + \text{DM}$

Stanislava Sevova, Kevin Sung
Northwestern University // on behalf of CMS collaboration

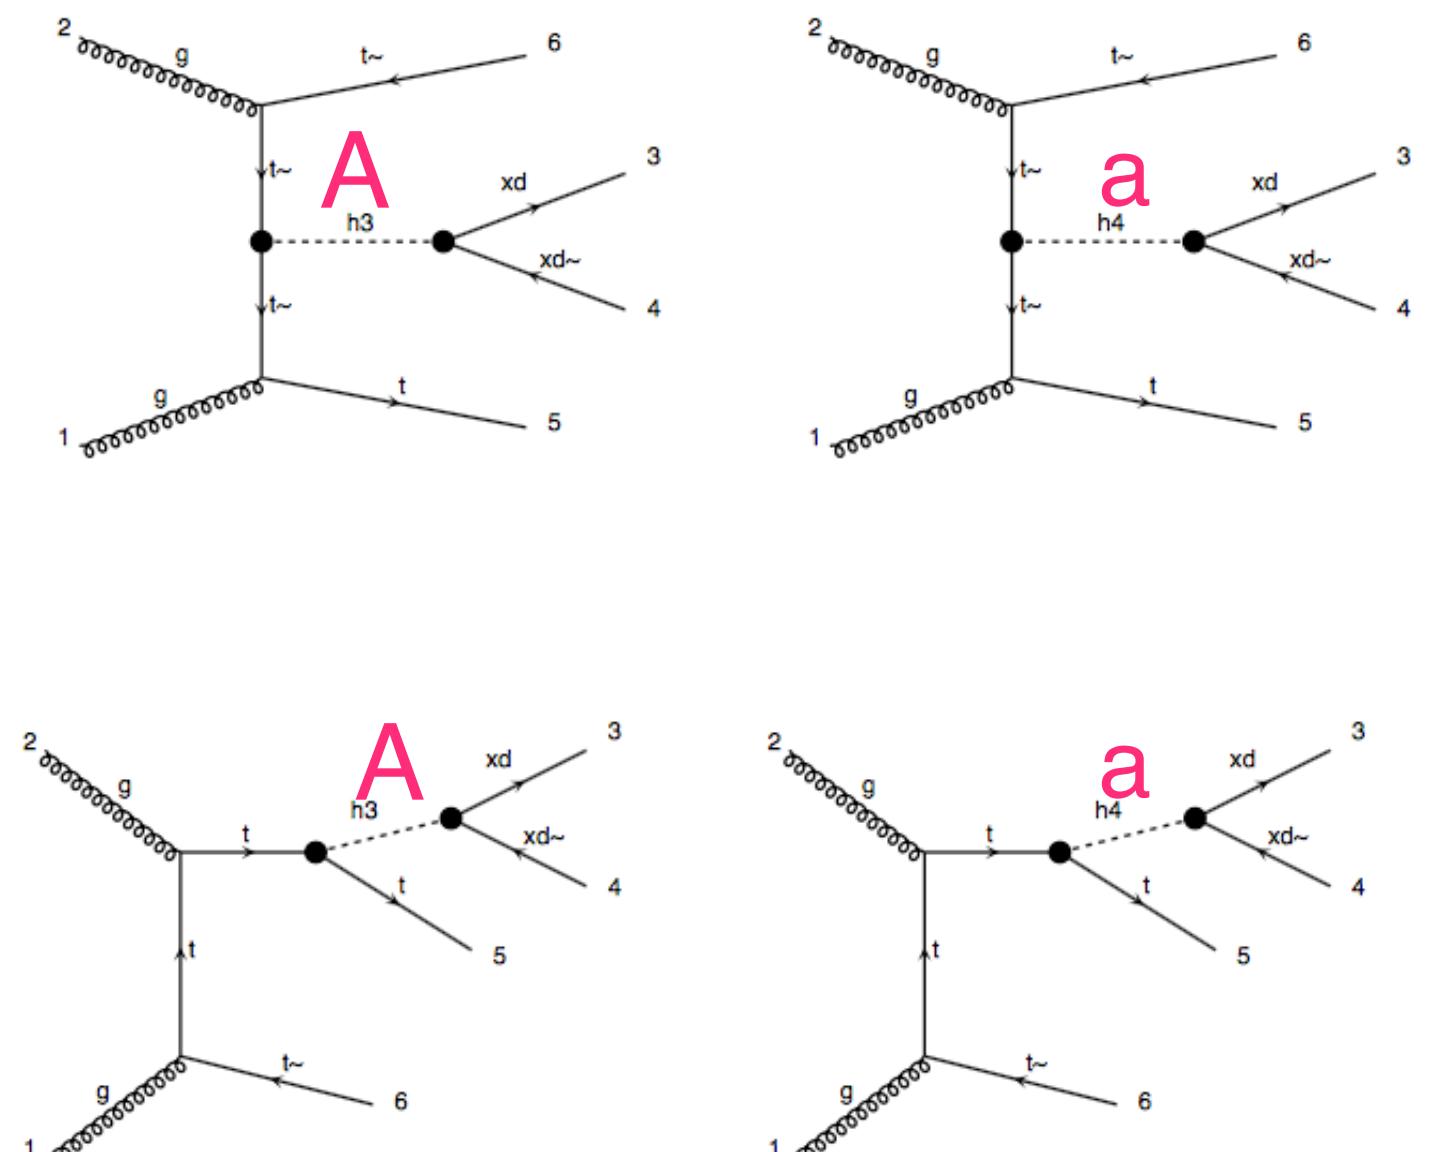

Model details

- 2HDM w/ additional PS mediator ([arXiv: 1701.07427](#) / [UFO](#))
 - M_h scalar Higgs (h_1)
 - M_H heavier scalar Higgs (h_2)
 - M_A pseudoscalar Higgs (h_3)
 - M_{H^\pm} charged Higgs (h_c)
 - M_a additional CP-odd weak eigenstate not present in nominal 2HDMs (h_4)
- More model parameters
 - α mixing angle between neutral CP-even weak eigenstates (H and h)
 - θ mixing angle between neutral CP-odd weak eigenstates (A and a)
 - $\tan\beta$ ratio of Higgs VEVs
 - M_{DM} Dirac fermion WIMP
- Important: working in alignment/decoupling limit where $\alpha = \beta - \pi/2$ so $\sin(\beta - \alpha) = 1$
 - h couples to massive EWK gauge bosons with SM h coupling strengths

$t\bar{t}+DM$ in context of model

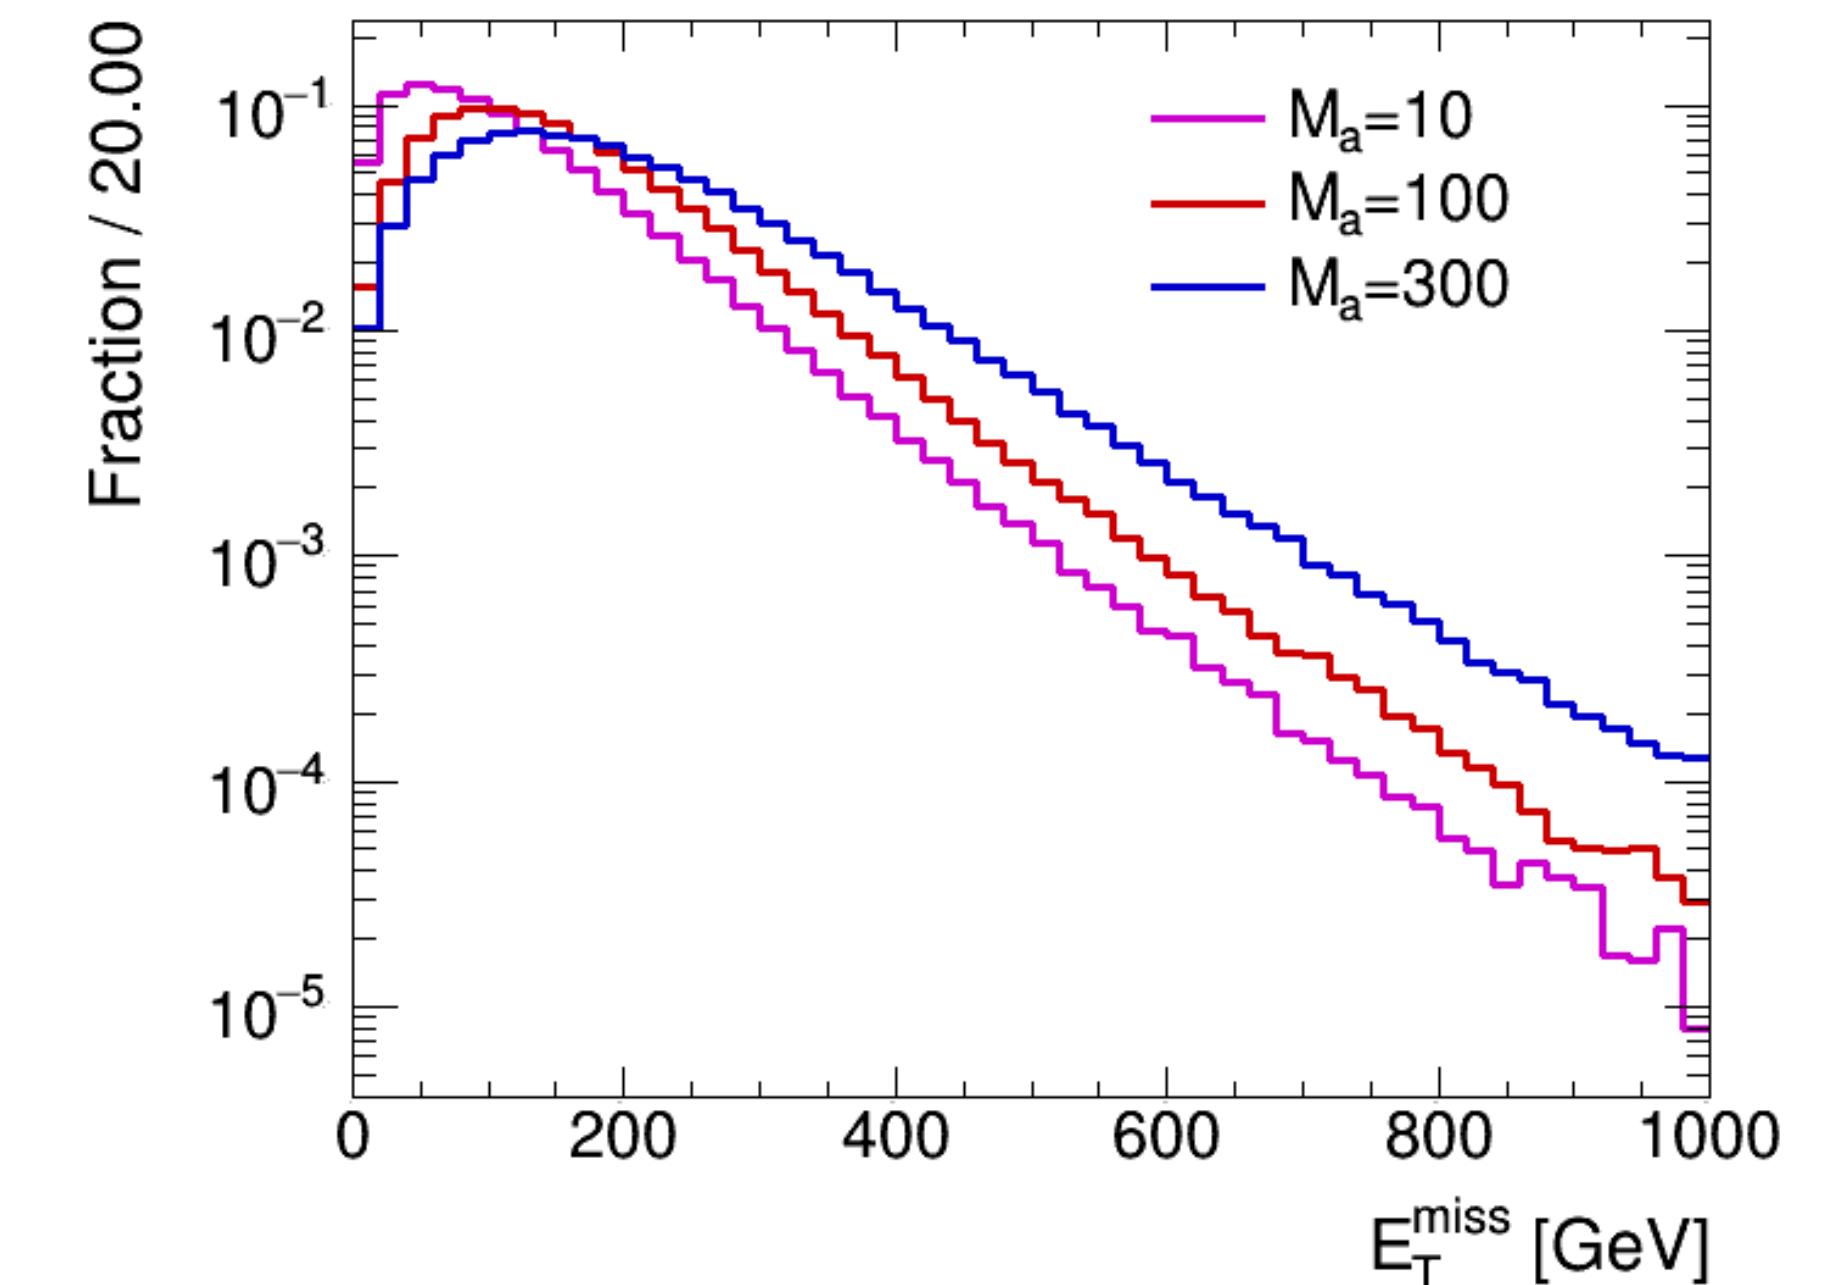

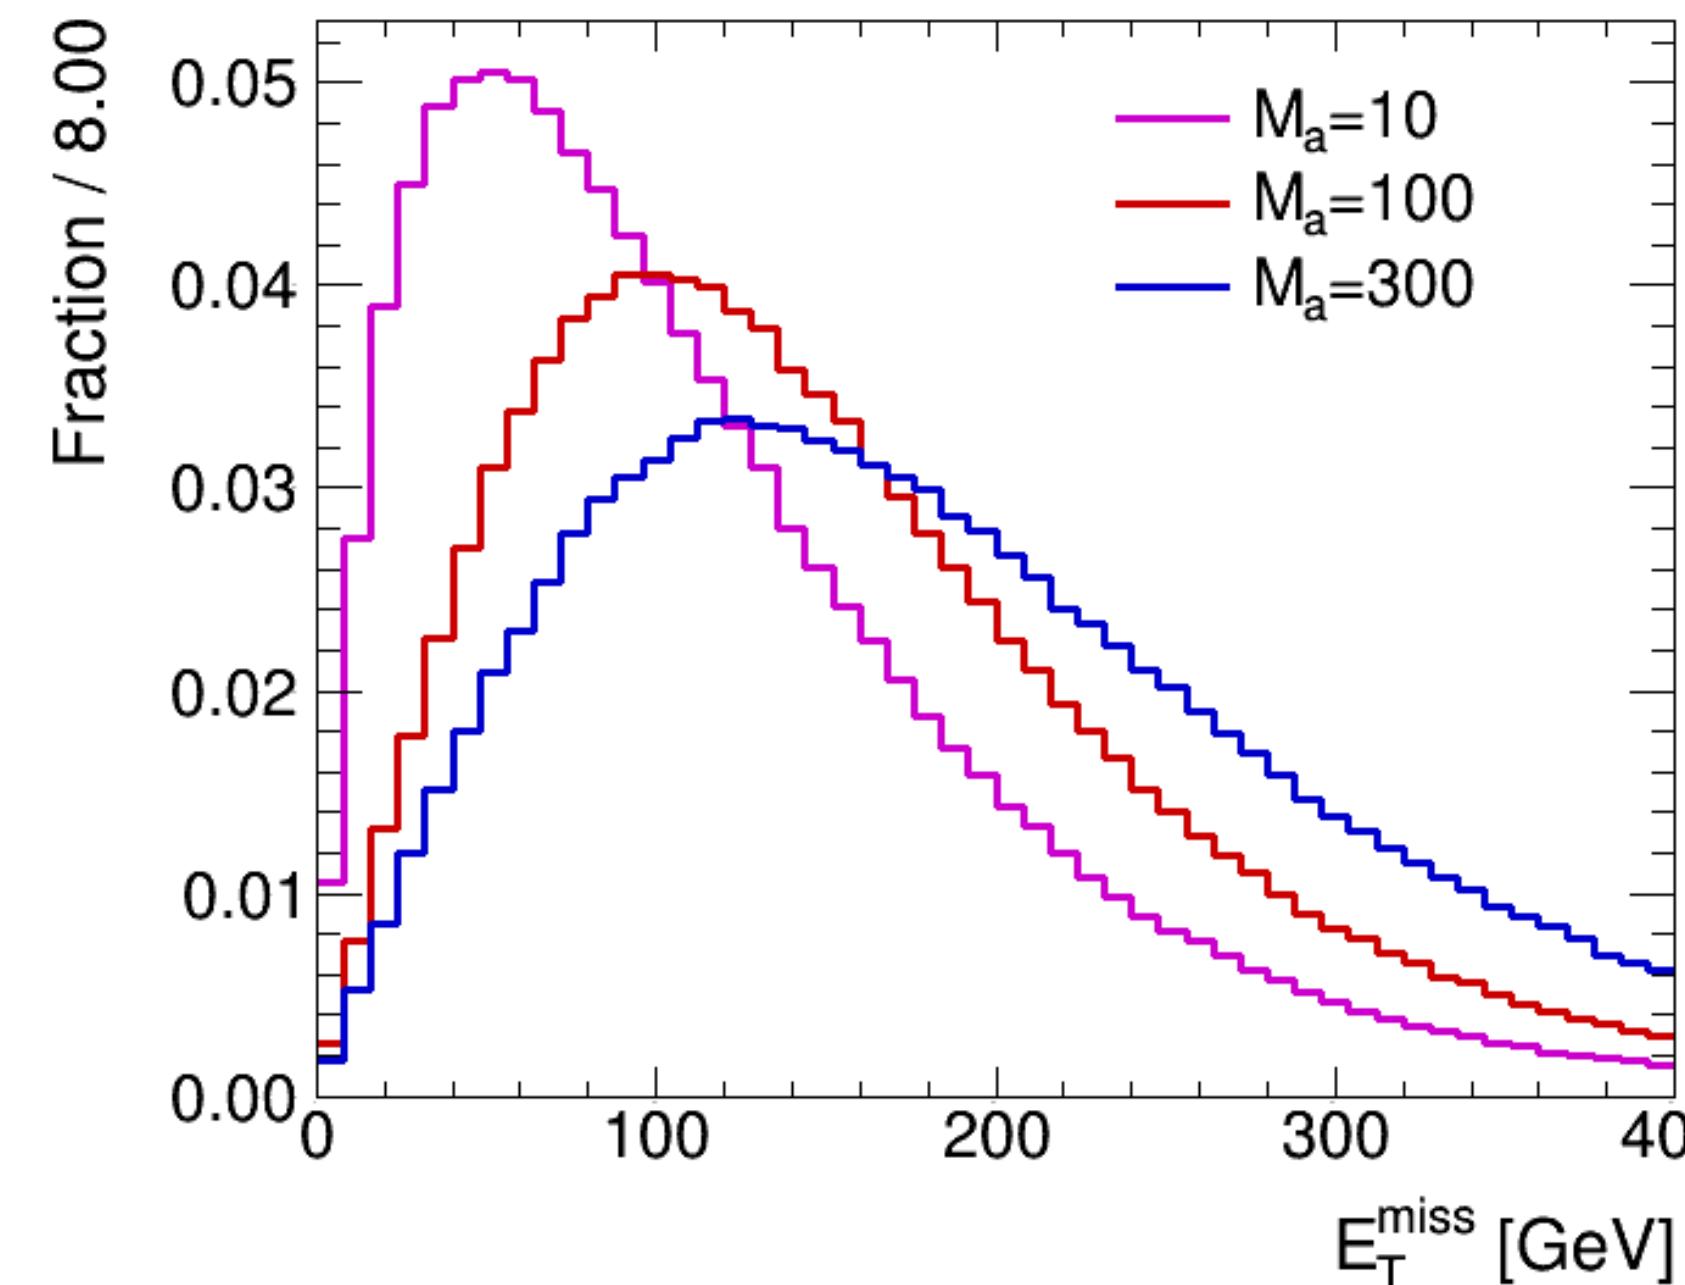

- Study $t\bar{t}+x\bar{x}$ process at LO (generate $p p > xd \bar{xd} t \bar{t}$) using MG5
 - Determine what, if any, kinematic dependence on tuneable model parameters $\sin\theta, \tan\beta, M_a, M_A, M_H, M_{H^{+/-}}, M_h$
 - Initially, investigate baseline scenarios inspired by 1701.07427
 - **Case 1:** Scan over M_a , and keep
 $\sin\theta=0.7071, M_H=M_{H^{+/-}}=750, M_h=125, M_A=500, \tan\beta=1$
 - **Case 2:** Scan over M_A , and keep
 $\sin\theta=0.7071, M_H=M_{H^{+/-}}=750, M_h=125, M_a=500, \tan\beta=1$
 - **Case 3:** Scan over $\sin\theta$ for some M_a , and keep
 $M_H=M_{H^{+/-}}=750, M_h=125, M_A=500, \tan\beta=1$
 - **Case 4:** Scan over $\tan\beta$, and keep
 $\sin\theta=0.7071, M_H=M_{H^{+/-}}=750, M_h=125, M_A=500, M_a=100$
- PDF set used: NNPDF30_lo_as_0130_nf_4

Example diagrams generated

Case 1: Scan M_a

$\sin\theta=0.7071$, $M_H=M_{H^{+/-}}=750$, $M_h=125$, $M_A=500$, $\tan\beta=1$, $M_{DM}=1$

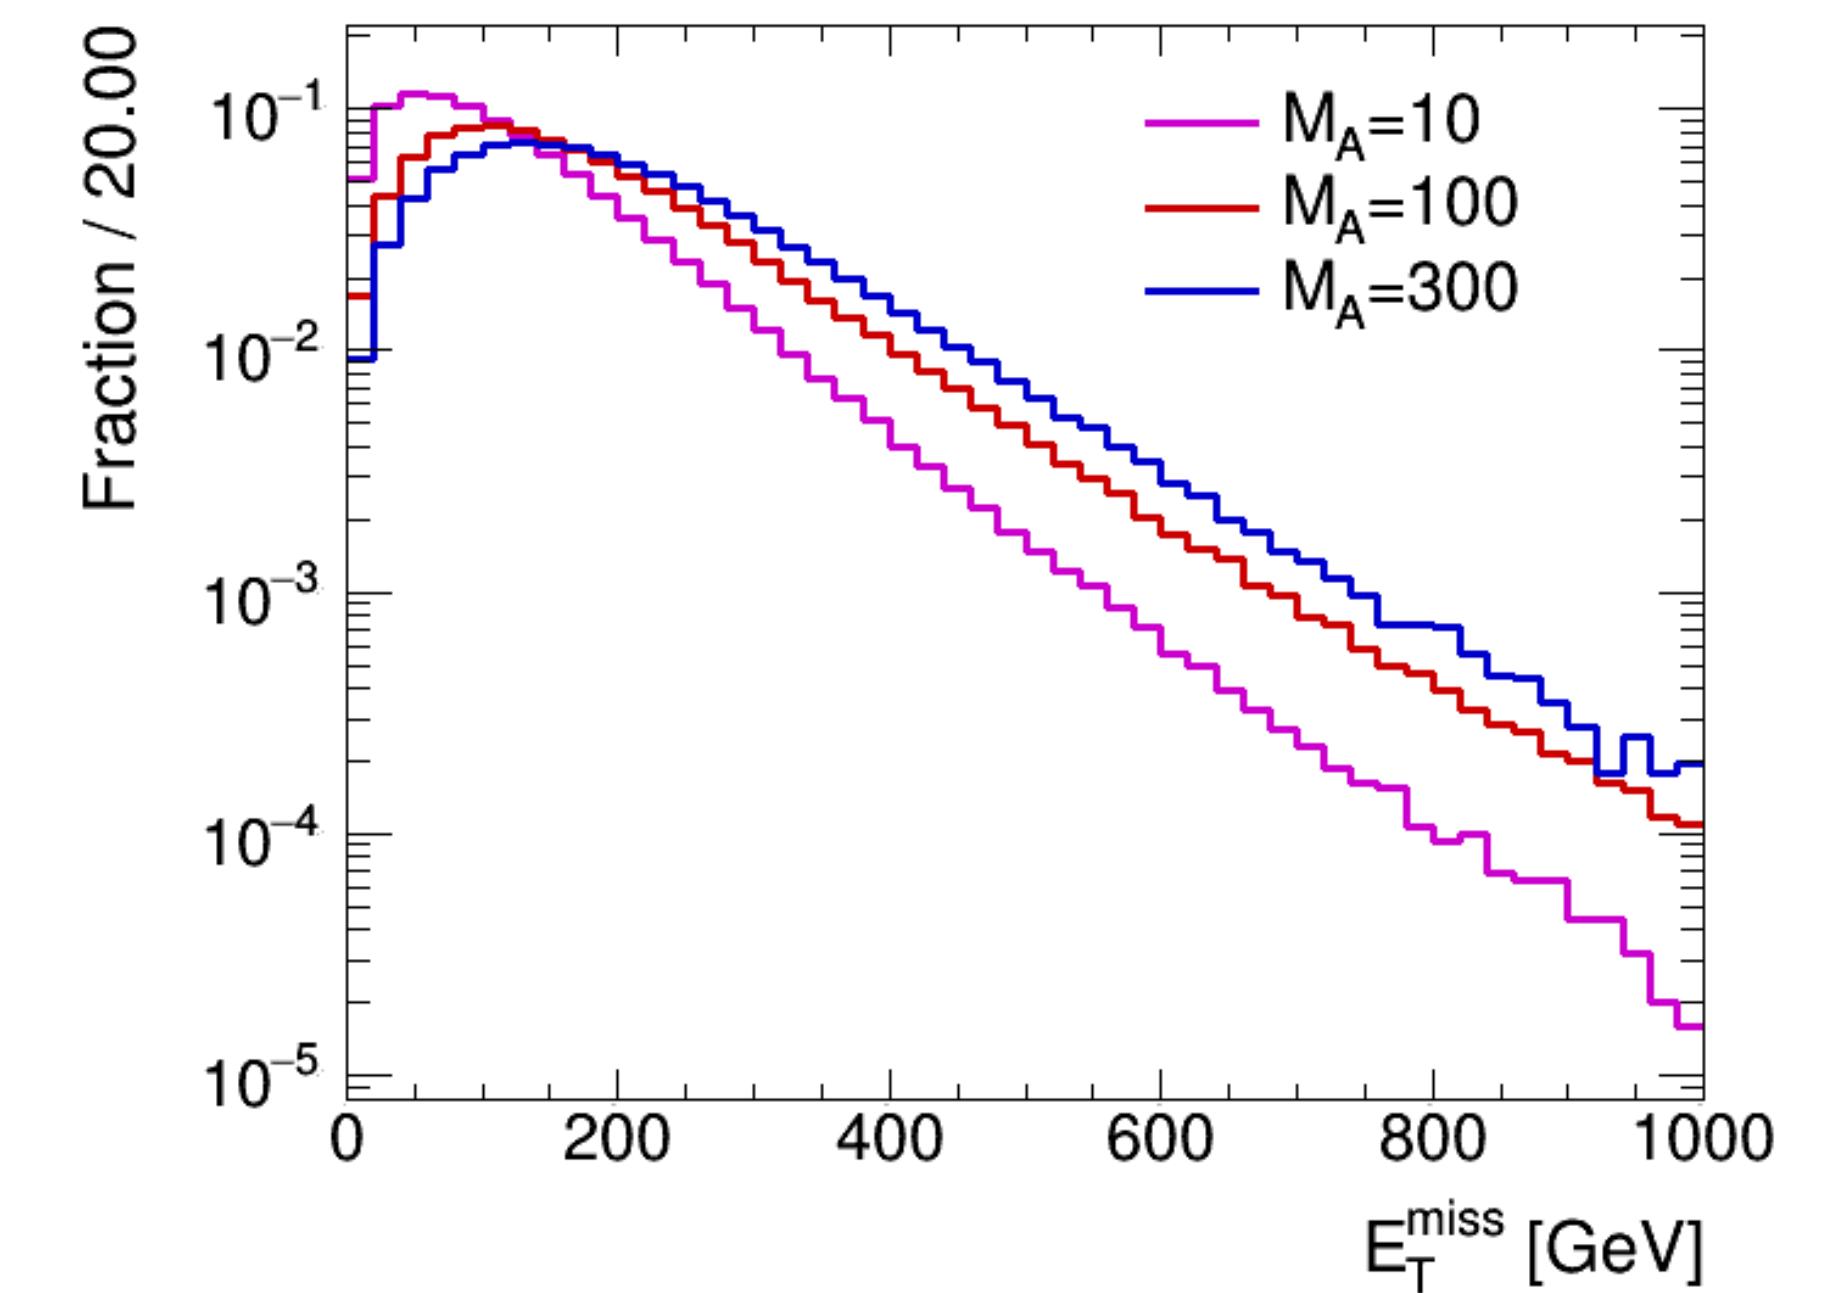

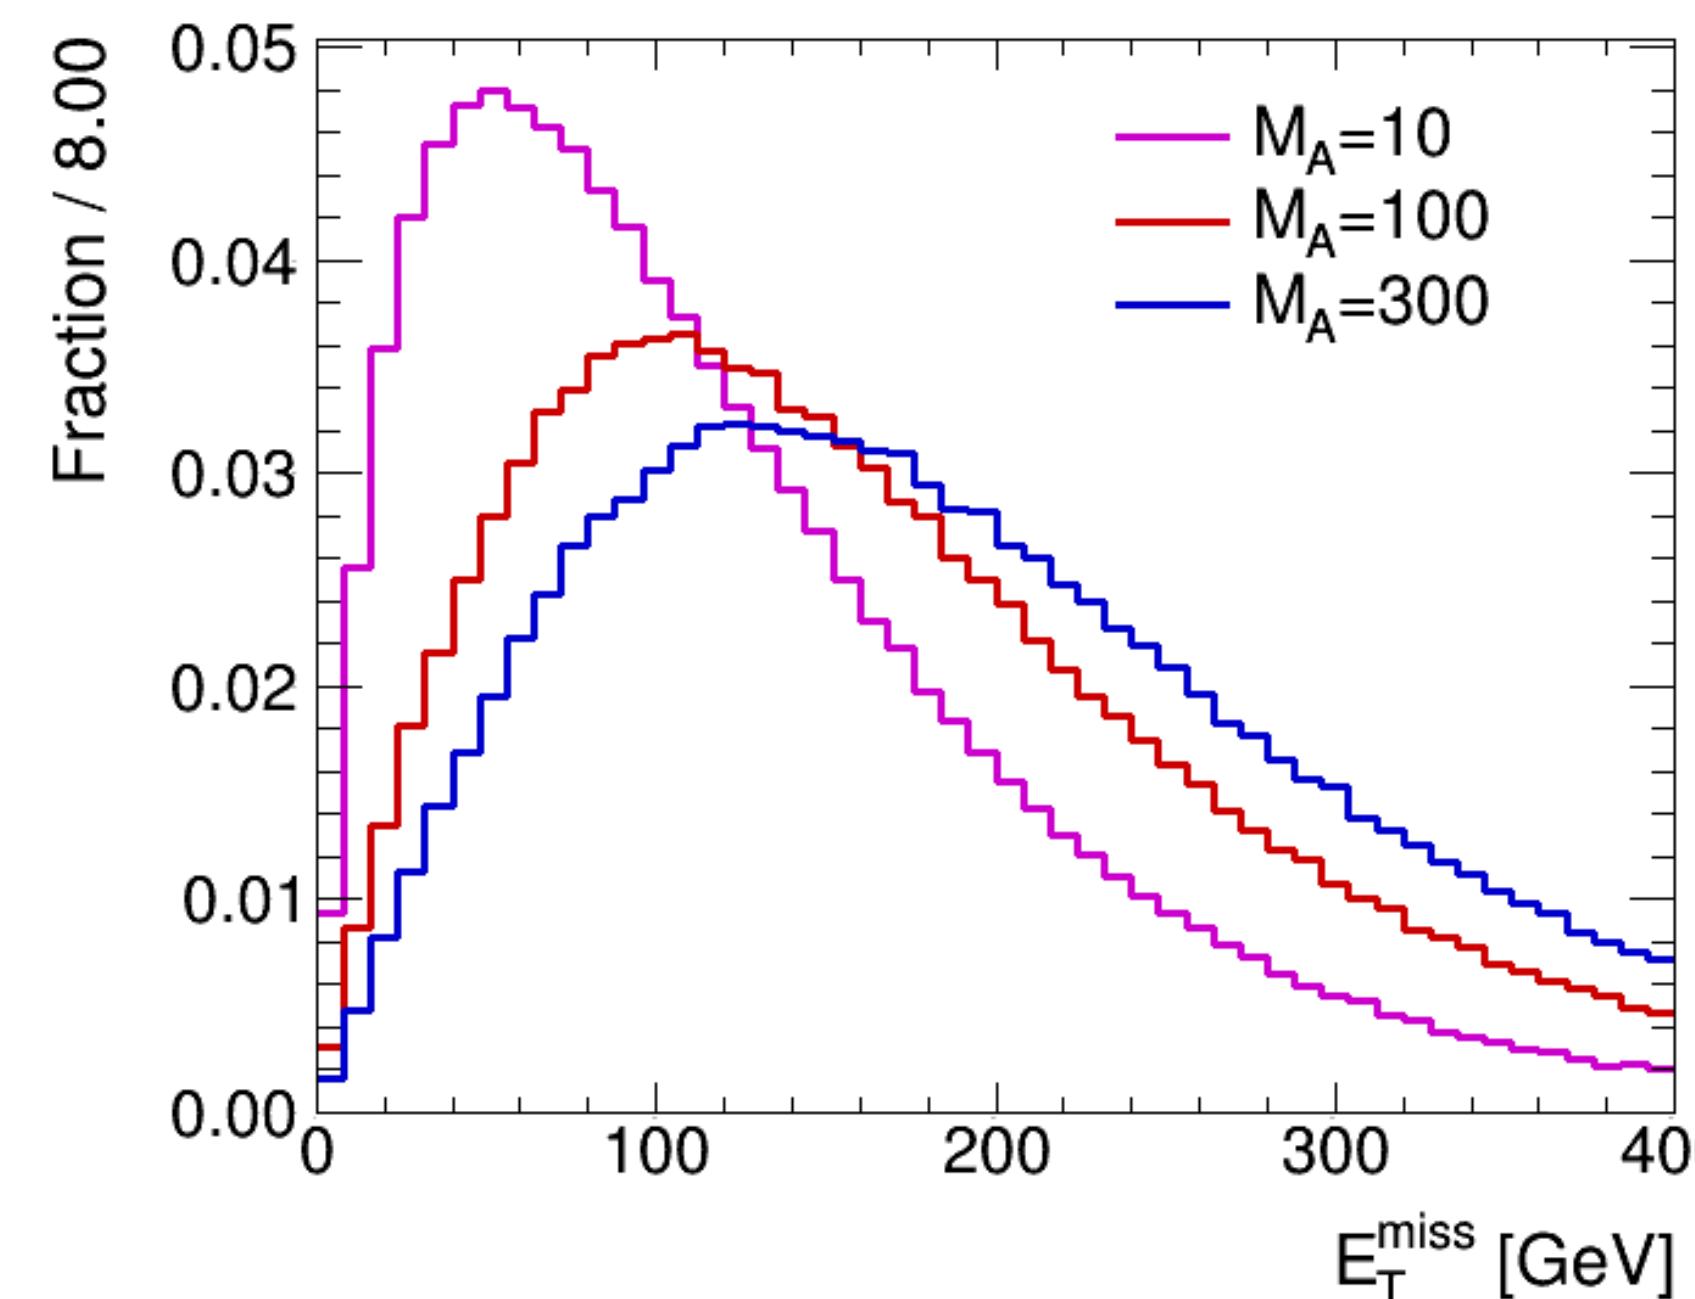

Harder MET spectrum with heavier M_a

- Mediator widths are calculated in MG5 (DECAY set to AUTO)
- E_T^{miss} = gen-level p_T of DMs produced

Case 2: Scan M_A

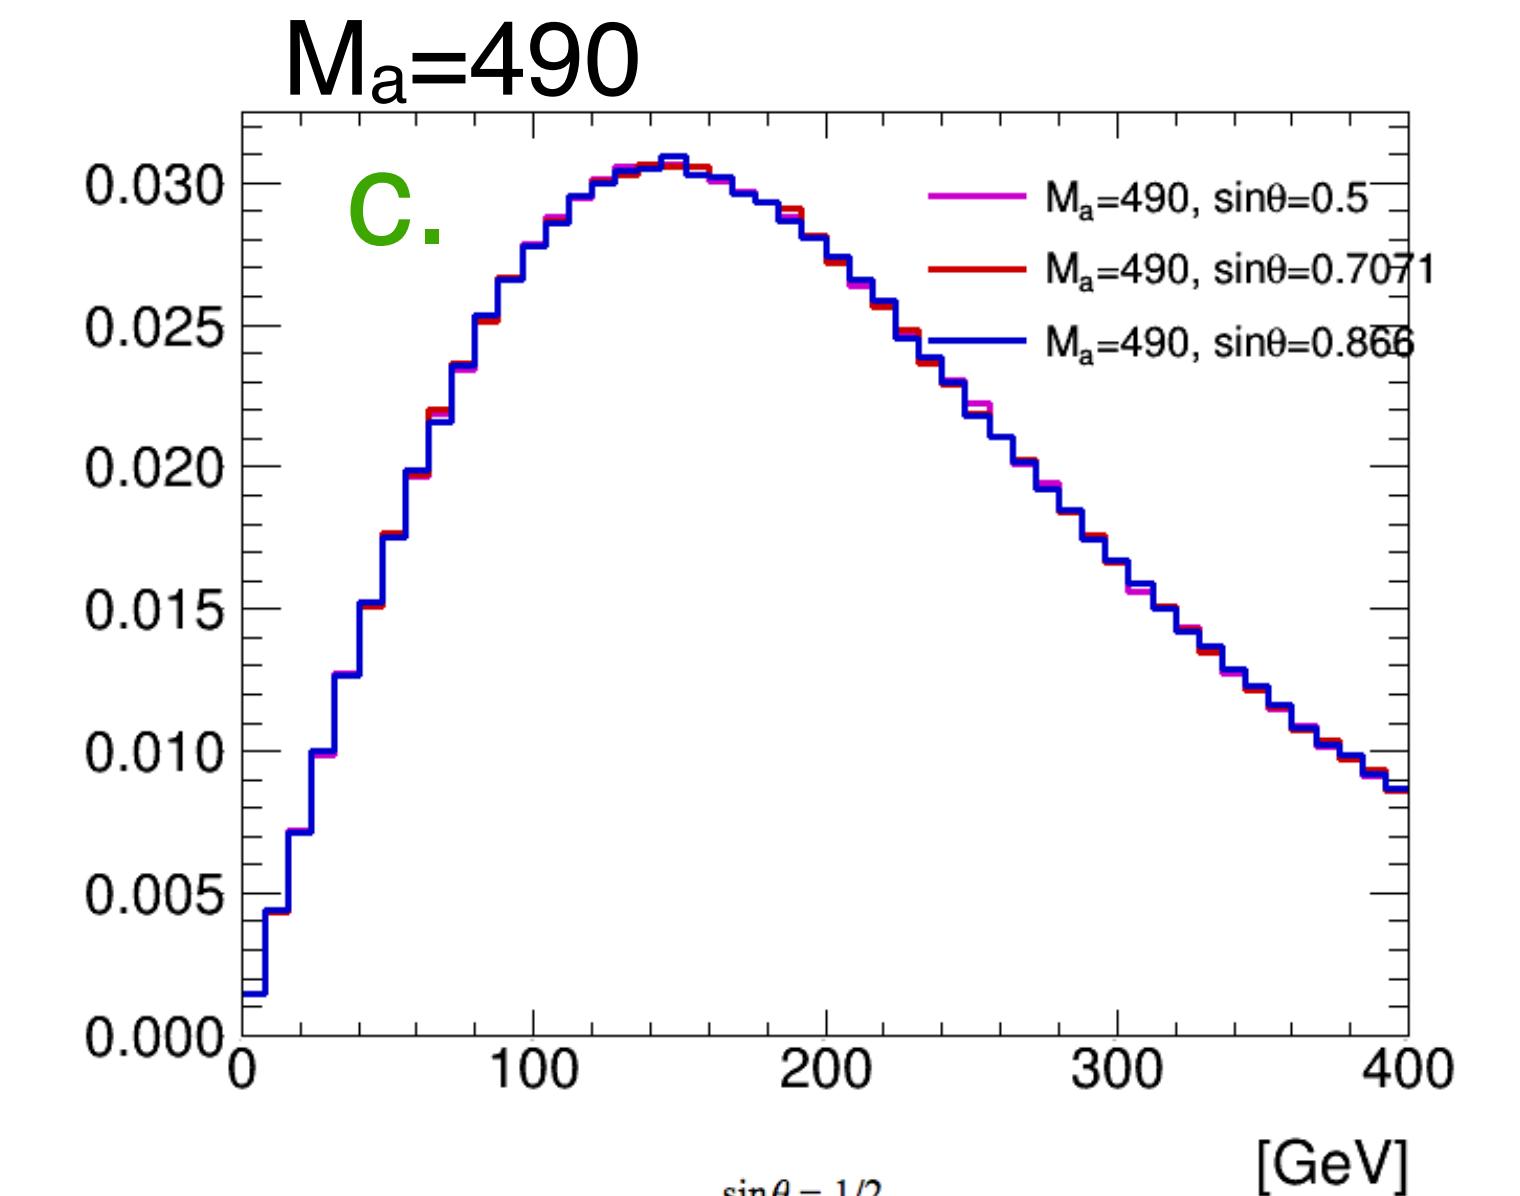

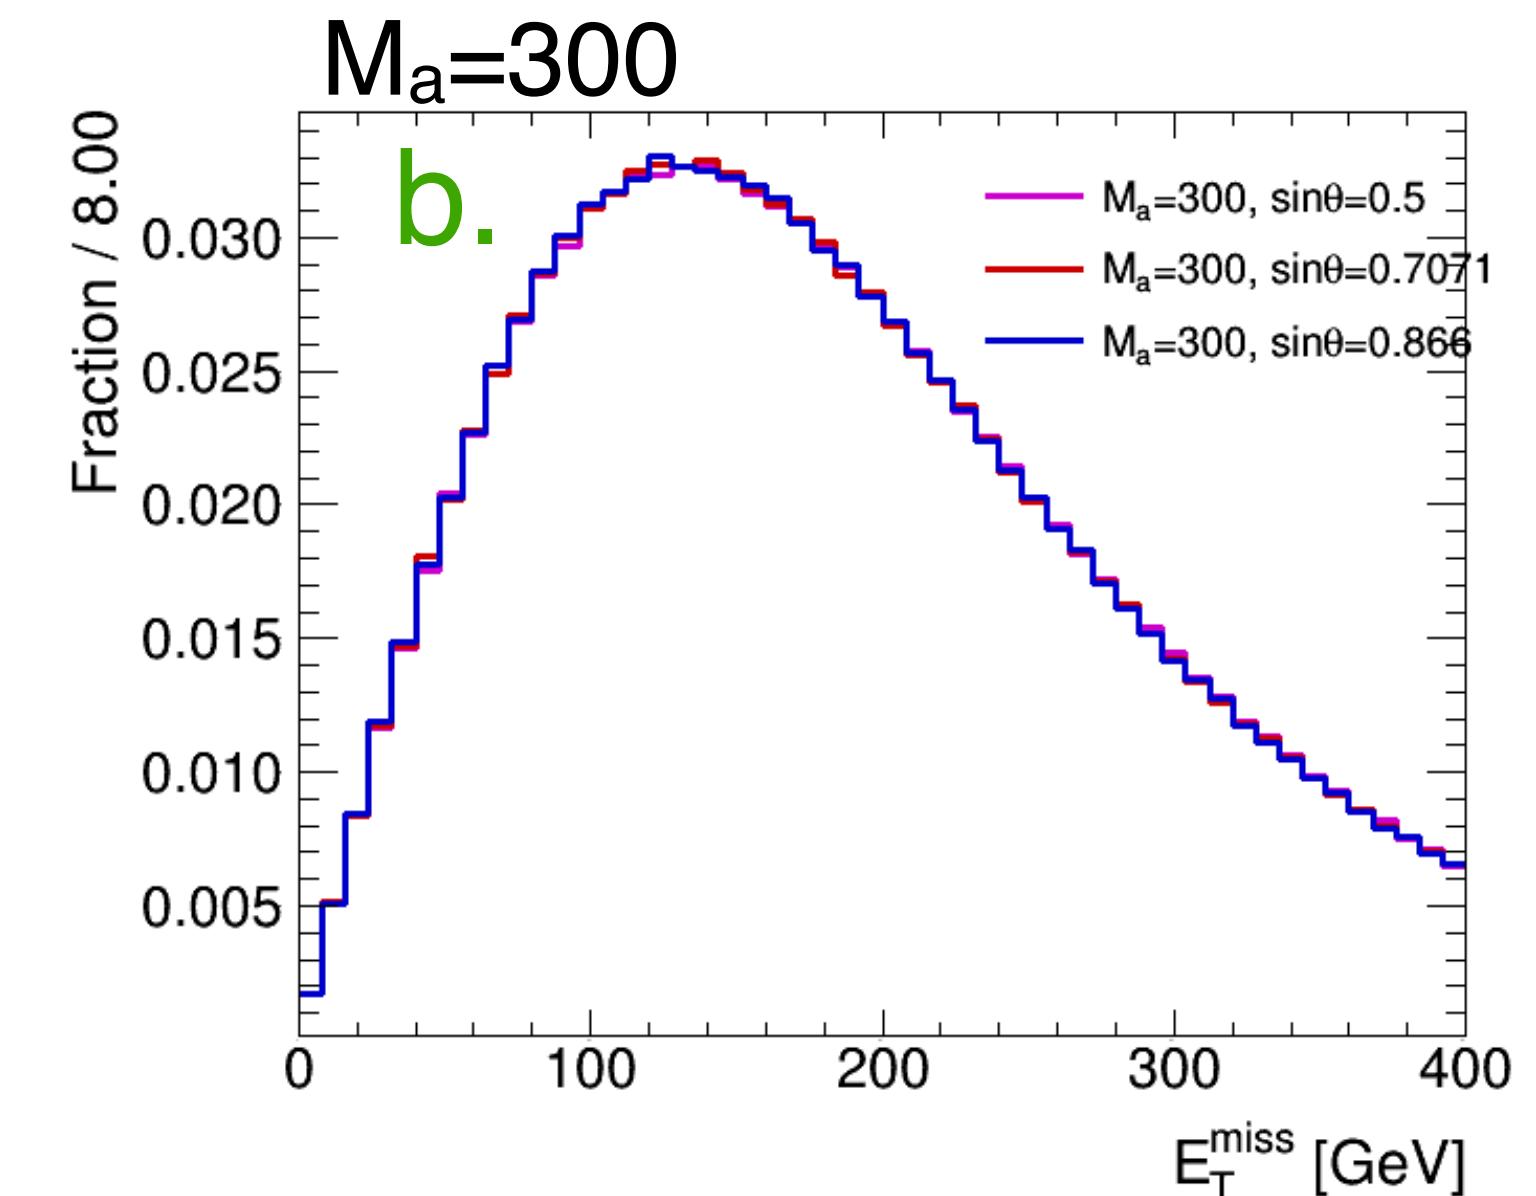

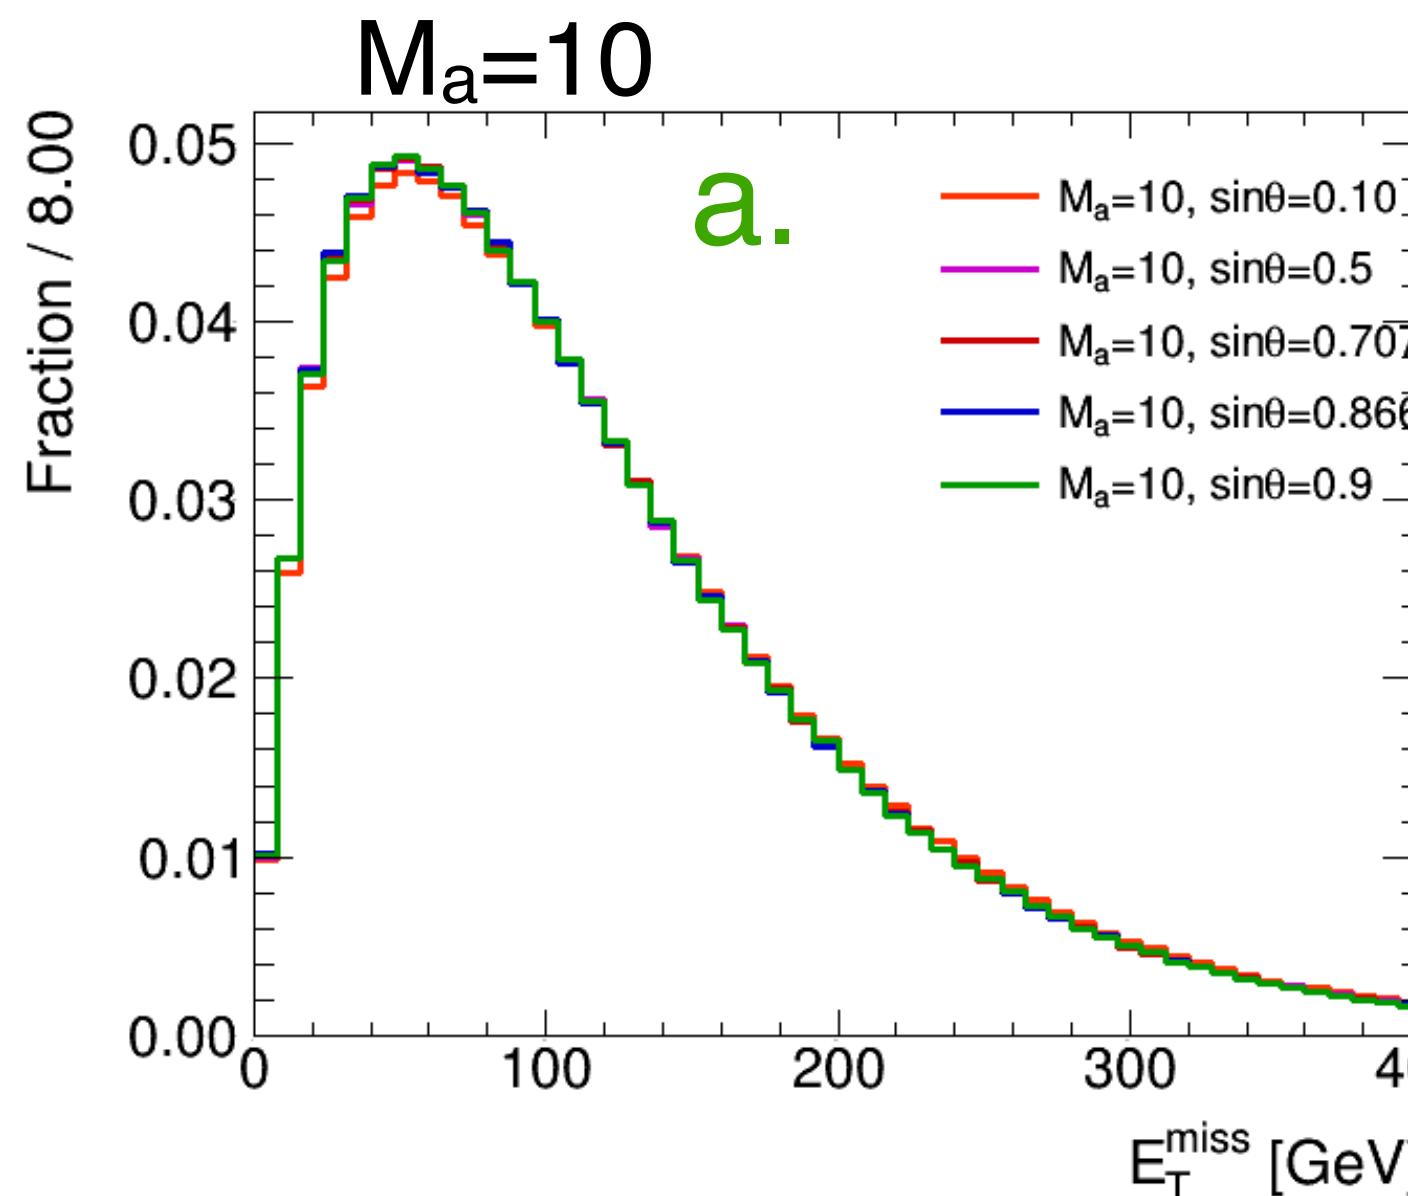

$\sin\theta=0.7071, M_H=M_{H^\pm}=750, M_h=125, M_a=500, \tan\beta=1, M_{DM}=1$

MET has similar dependence on M_A as on M_a

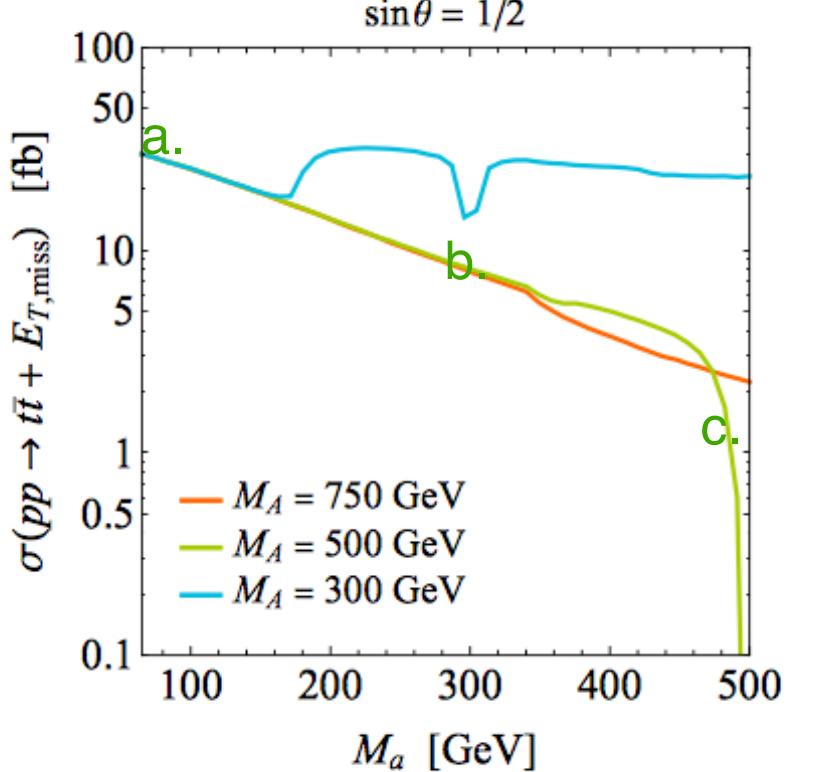

Case 3: Scan $\sin\theta$ for some M_a

$M_H = M_{H^\pm} = 750$, $M_h = 125$, $M_A = 500$, $\tan\beta = 1$, $M_{DM} = 1$

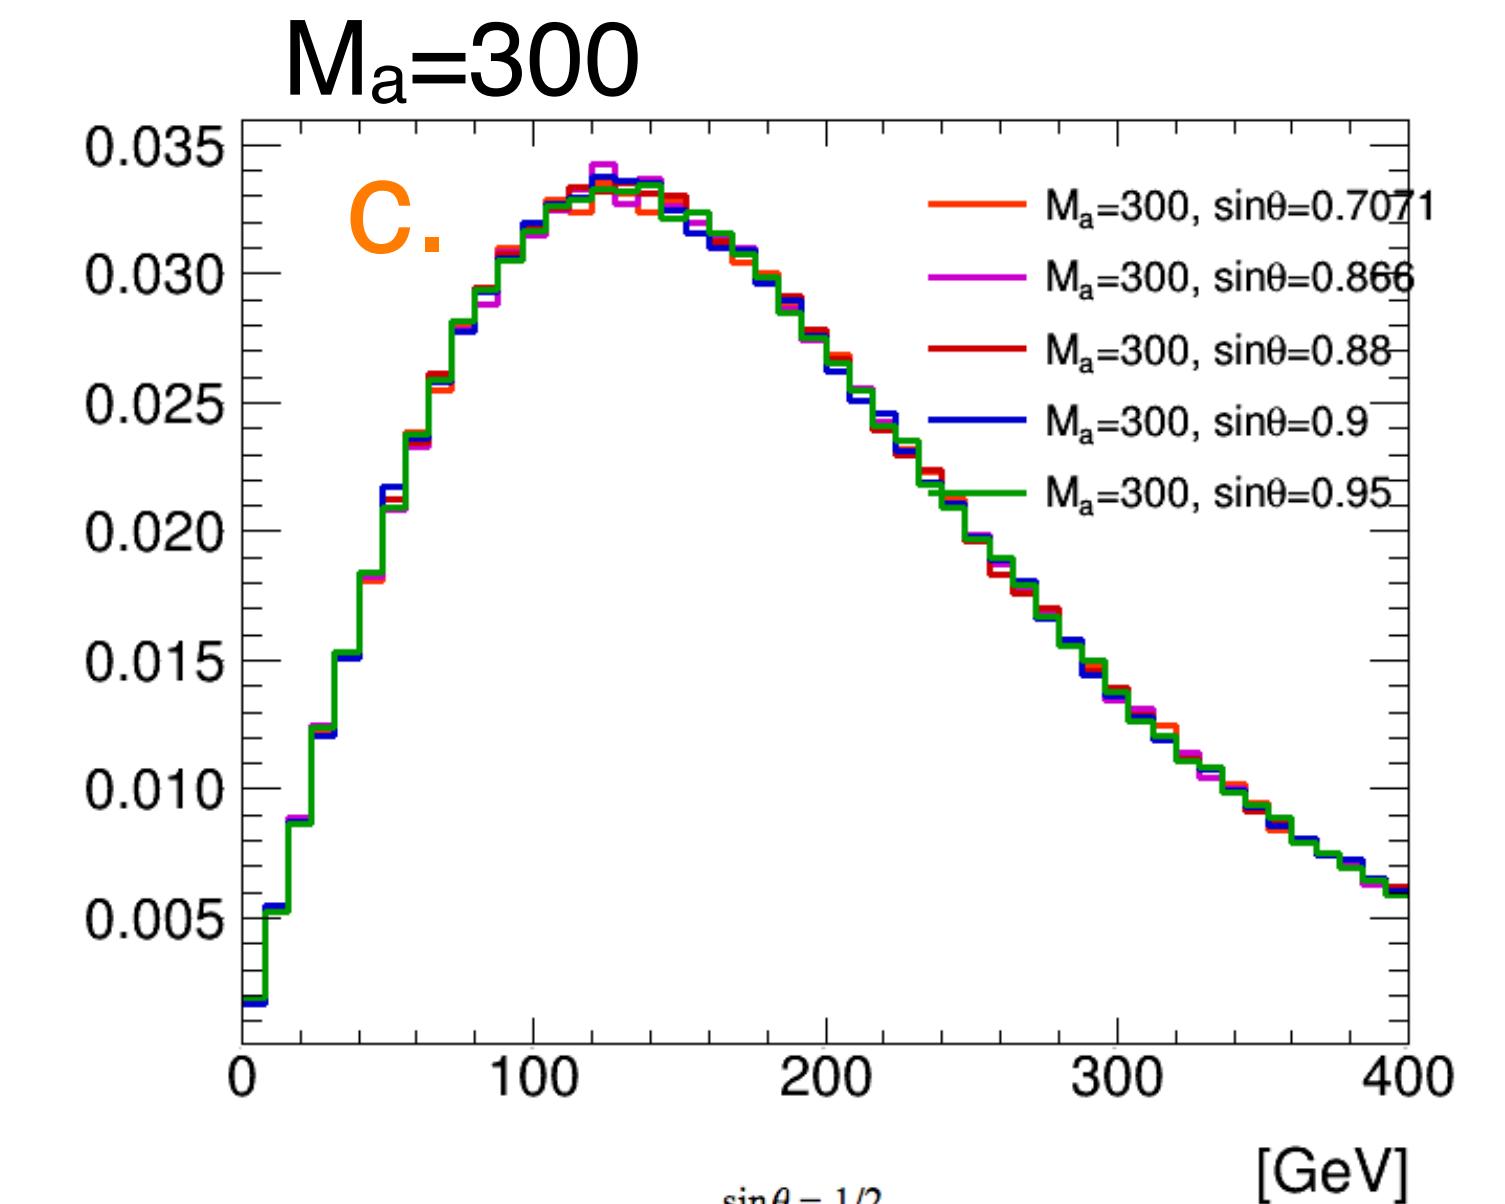

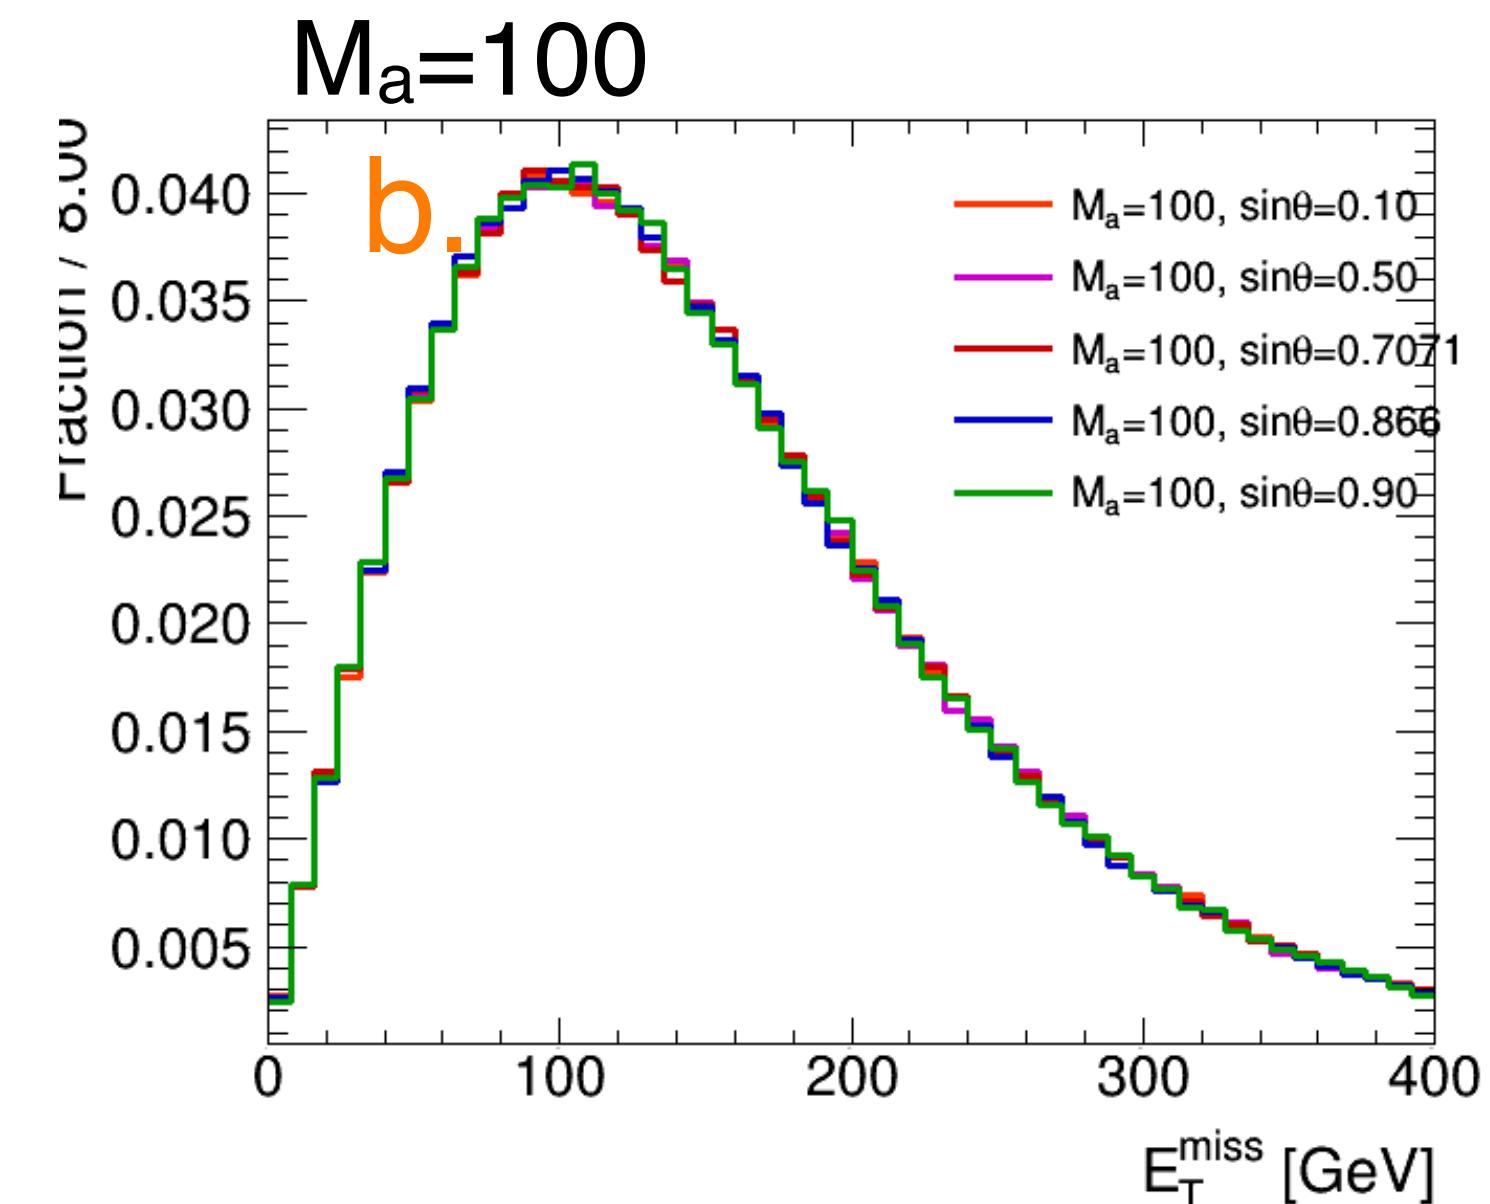

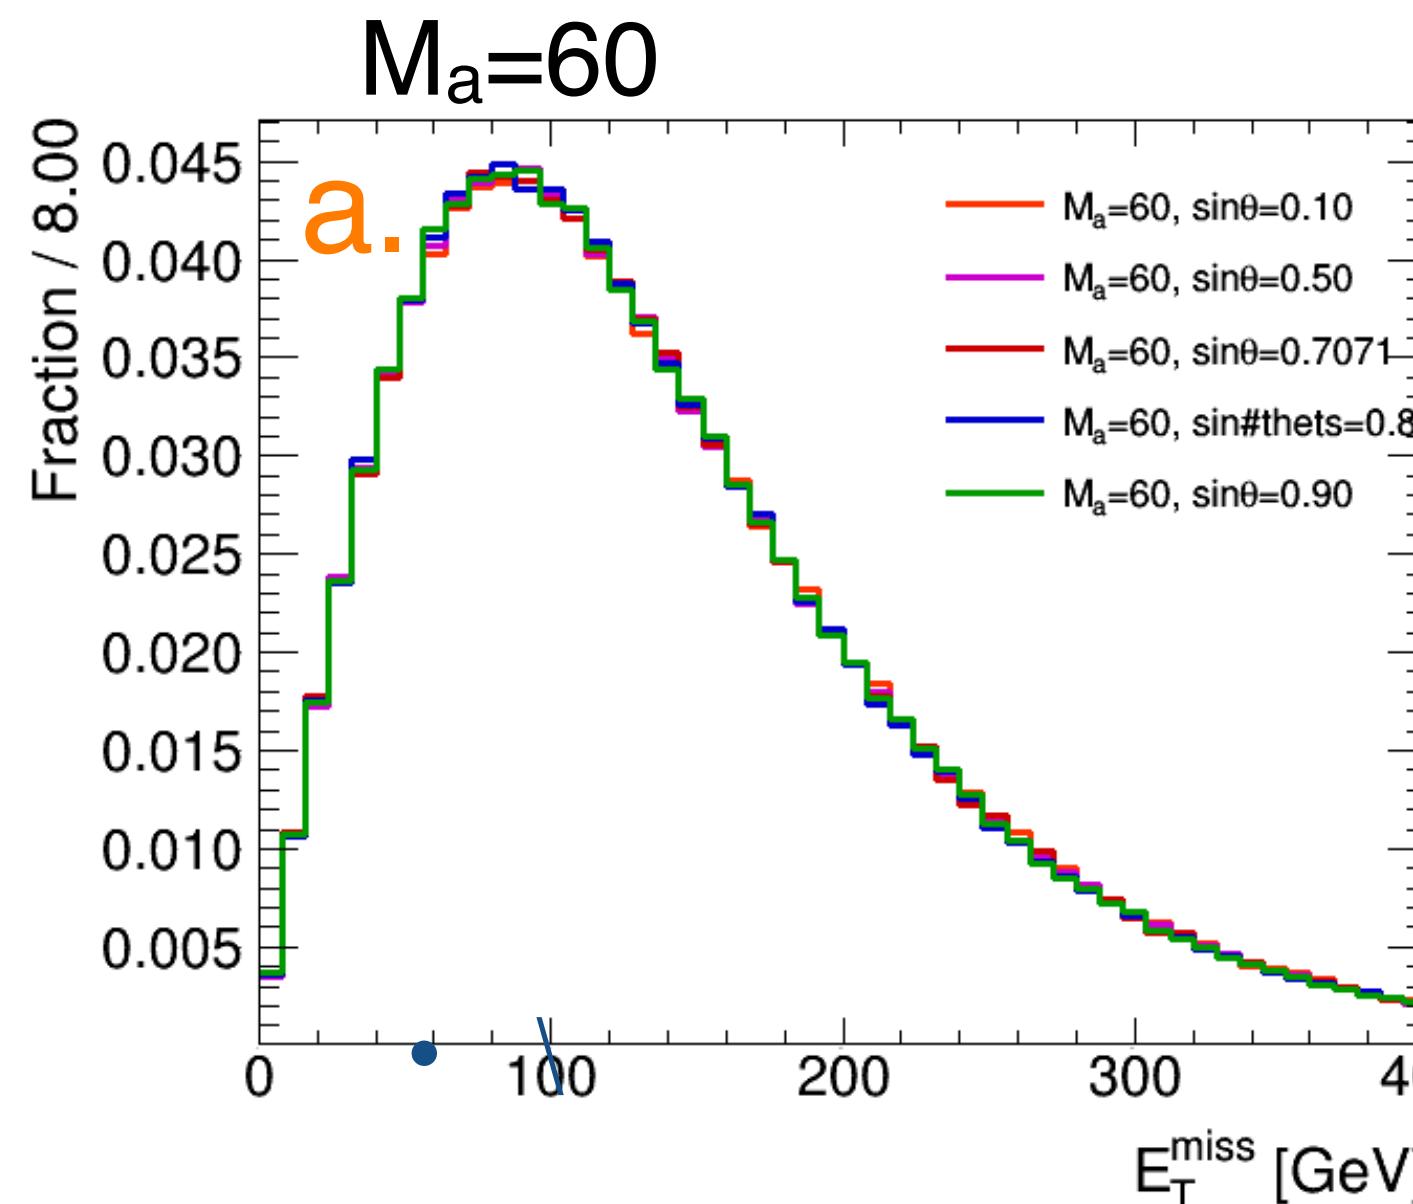

MET has no dependence on $\sin\theta$, but cross sections do change

- Generated LO diagrams are symmetric wrt exchange mediator (a/A)
- $\Gamma(A \rightarrow X\bar{X}) \propto \sin^2\theta$ and $\Gamma(a \rightarrow X\bar{X}) \propto \cos^2\theta$

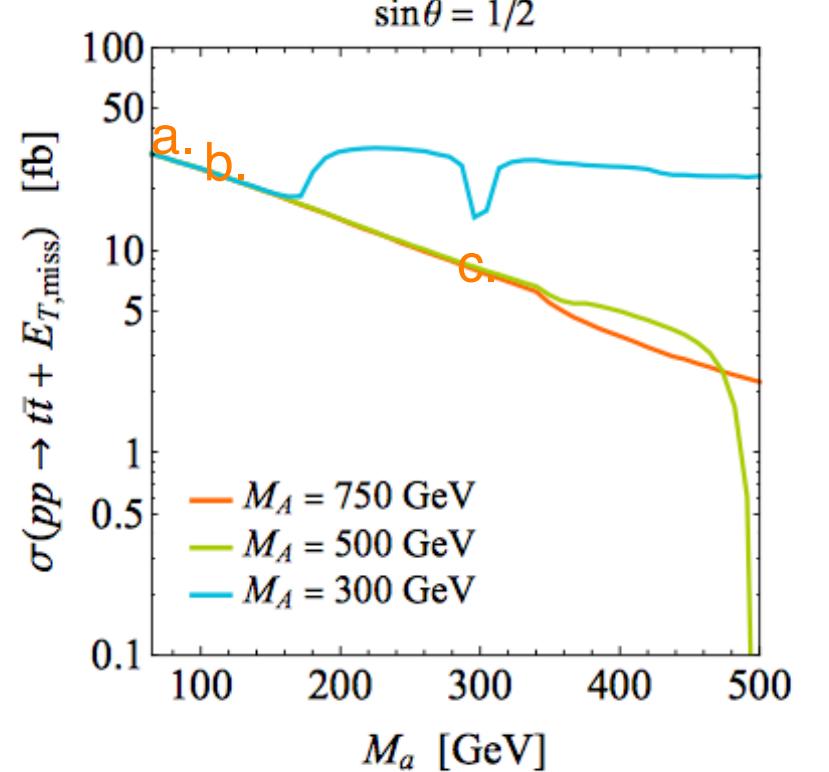

Case 3 cont'd: Scan $\sin\theta$ for some M_a

$M_H = M_{H^\pm} = 750$, $M_h = 125$, $M_A = 750$, $\tan\beta = 1$, $M_{DM} = 1$

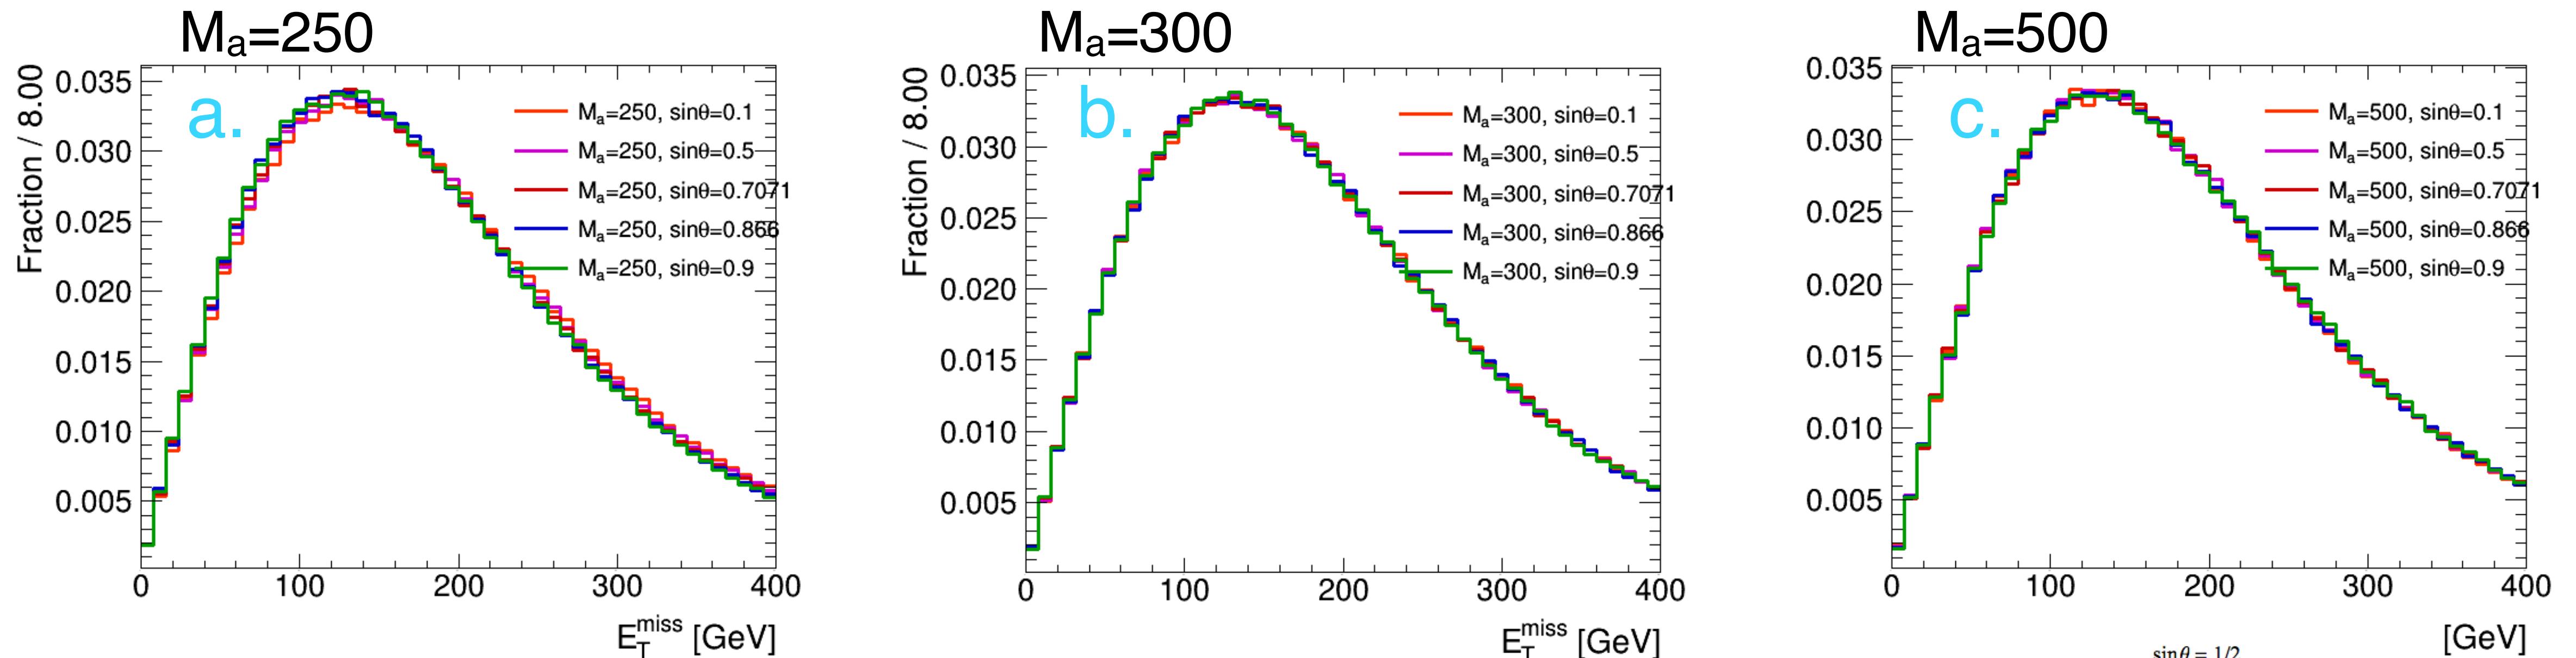

MET has no dependence on $\sin\theta$, but cross sections do change

- Generated LO diagrams are symmetric wrt exchange mediator (a/A)
- $\Gamma(A \rightarrow X\bar{X}) \propto \sin^2\theta$ and $\Gamma(a \rightarrow X\bar{X}) \propto \cos^2\theta$

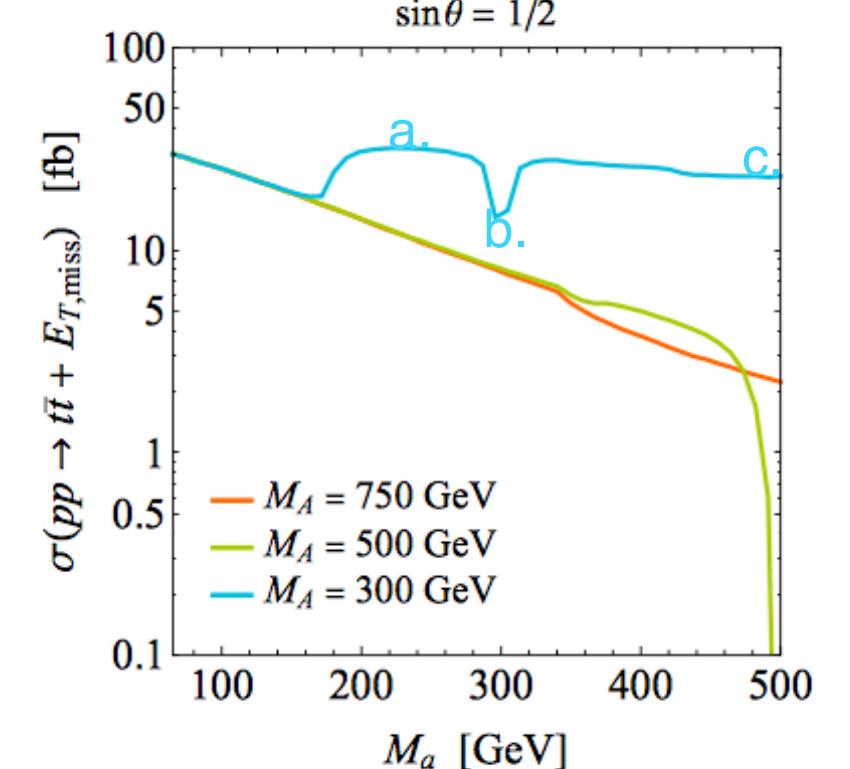

Case 3 cont'd: Scan $\sin\theta$ for some M_a

$M_H = M_{H^\pm} = 750$, $M_h = 125$, $M_A = 300$, $\tan\beta = 1$, $M_{DM} = 1$

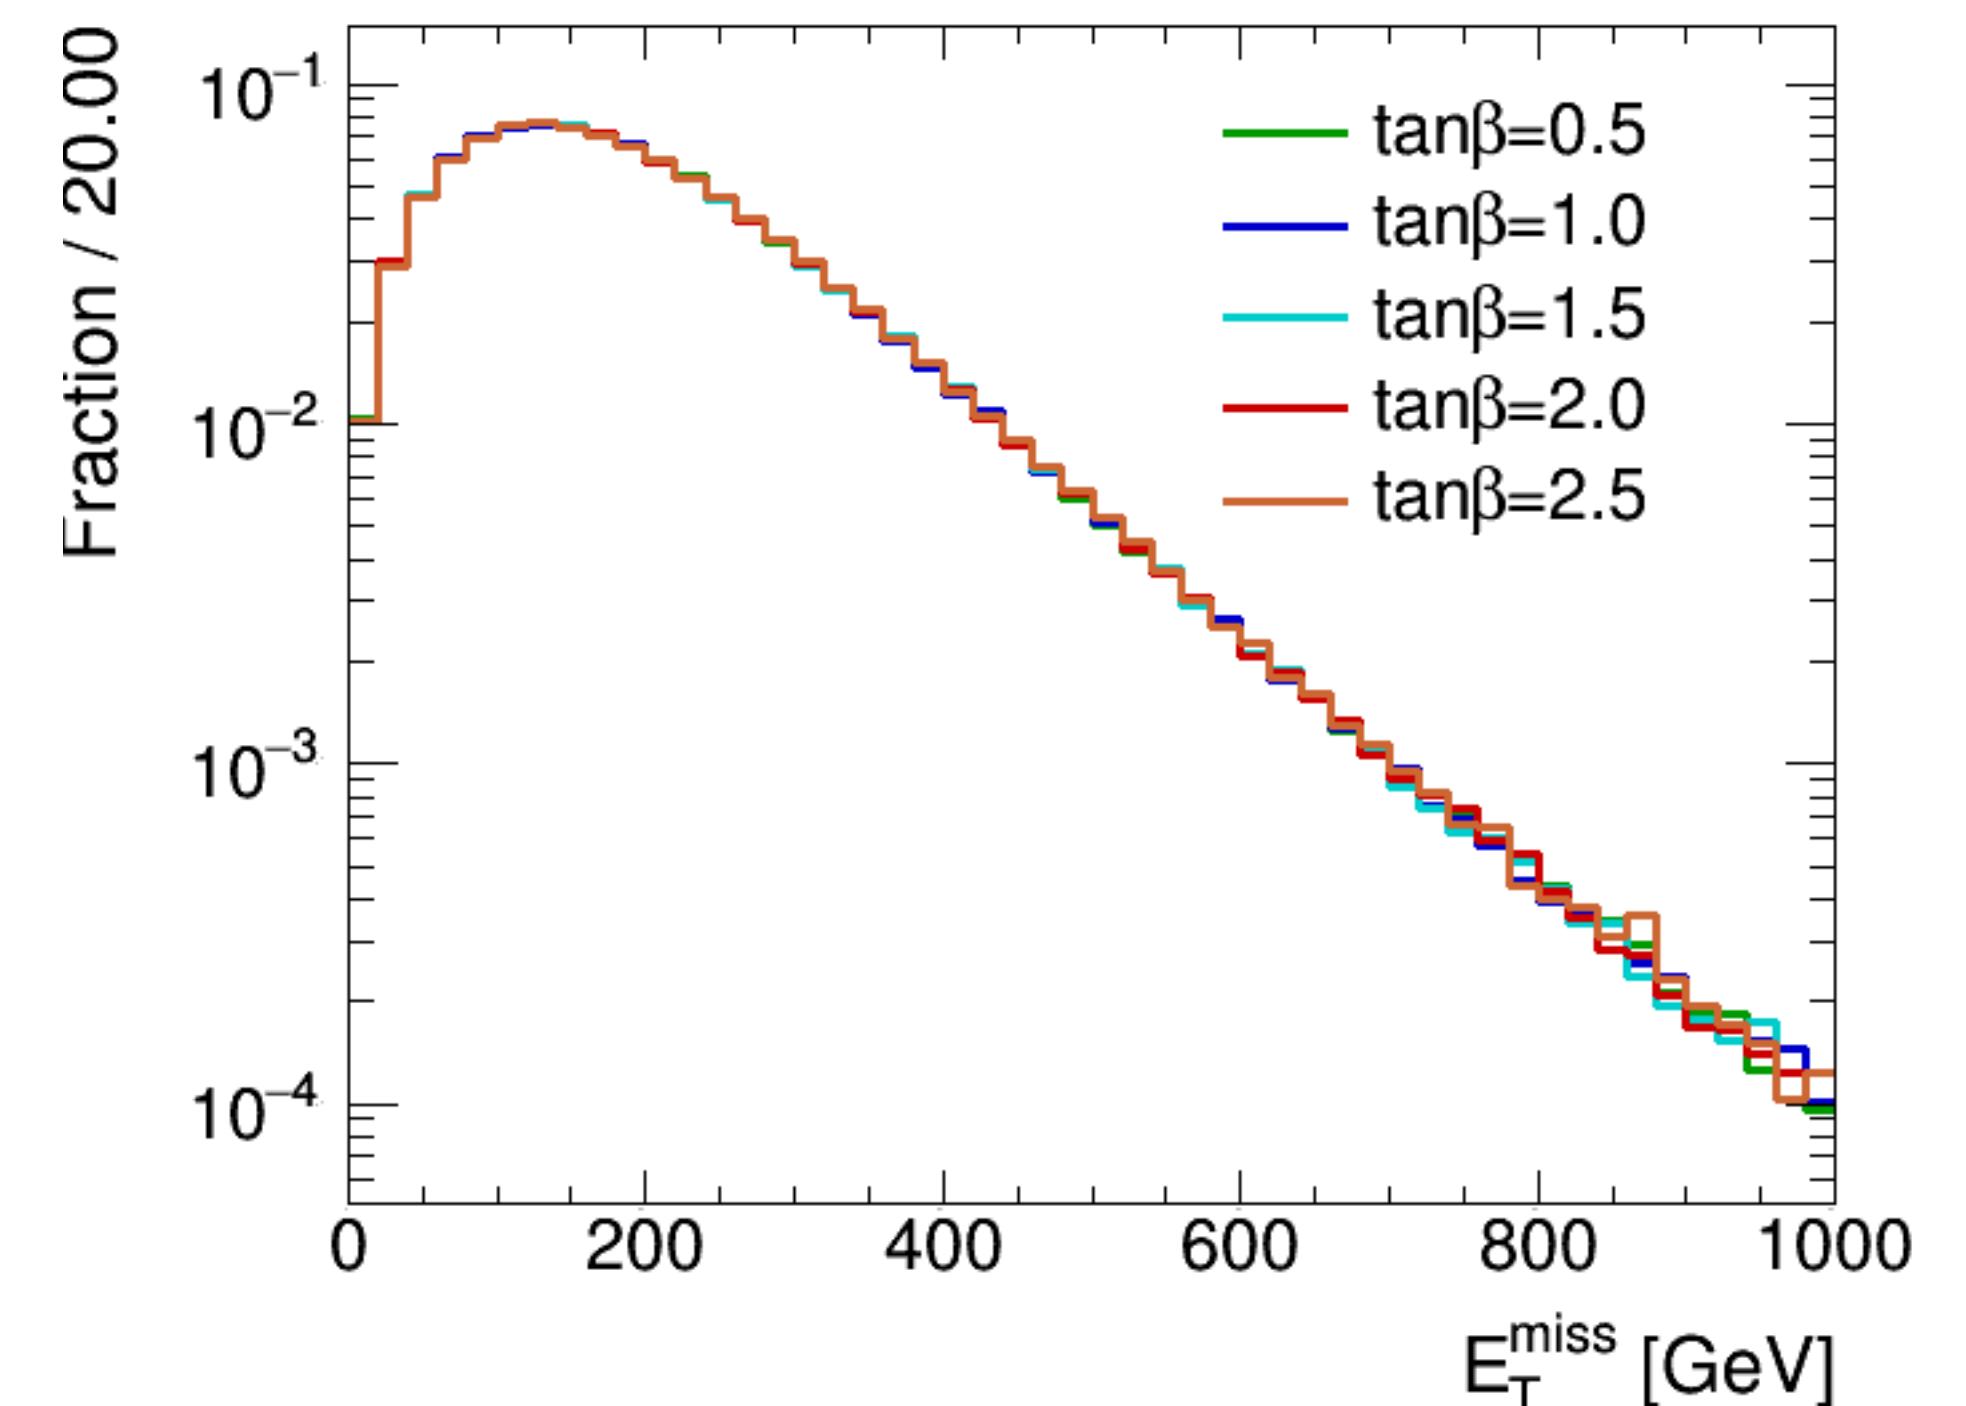

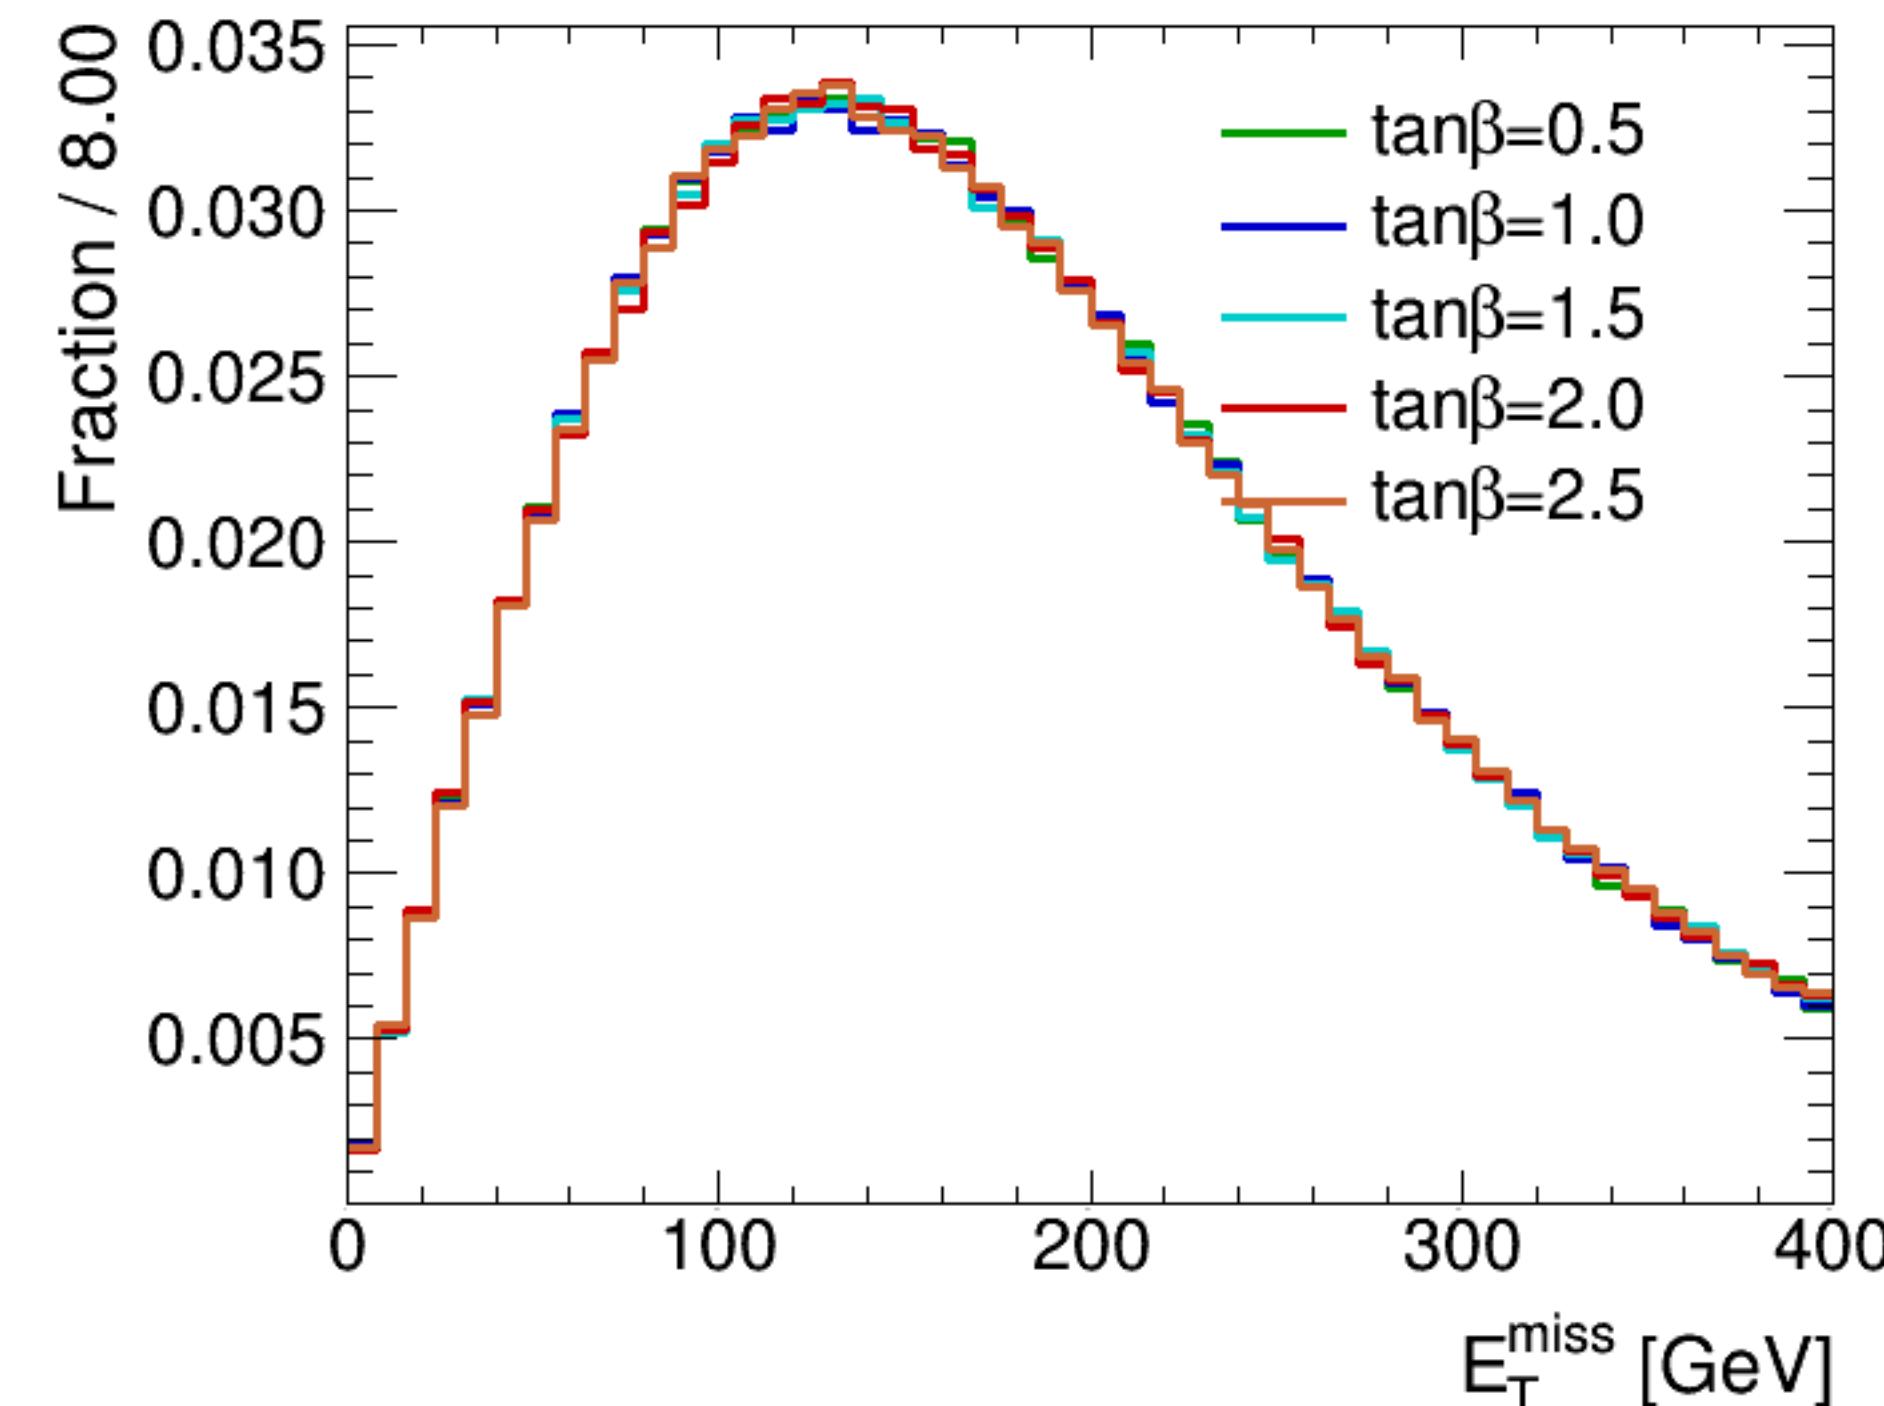

- Constructive and destructive interference occurs near $M_a \sim M_A - M_h \sim 175$ and $M_a \sim M_A$ ($A \rightarrow ah$ dominates over $A \rightarrow XX$)
- Inclusive cross-sections confirm $\sigma_a \sim 3\sigma_b$ and $\sigma_c \sim 2.5\sigma_b$ from 1701.07427

Case 4: Scan $\tan\beta$

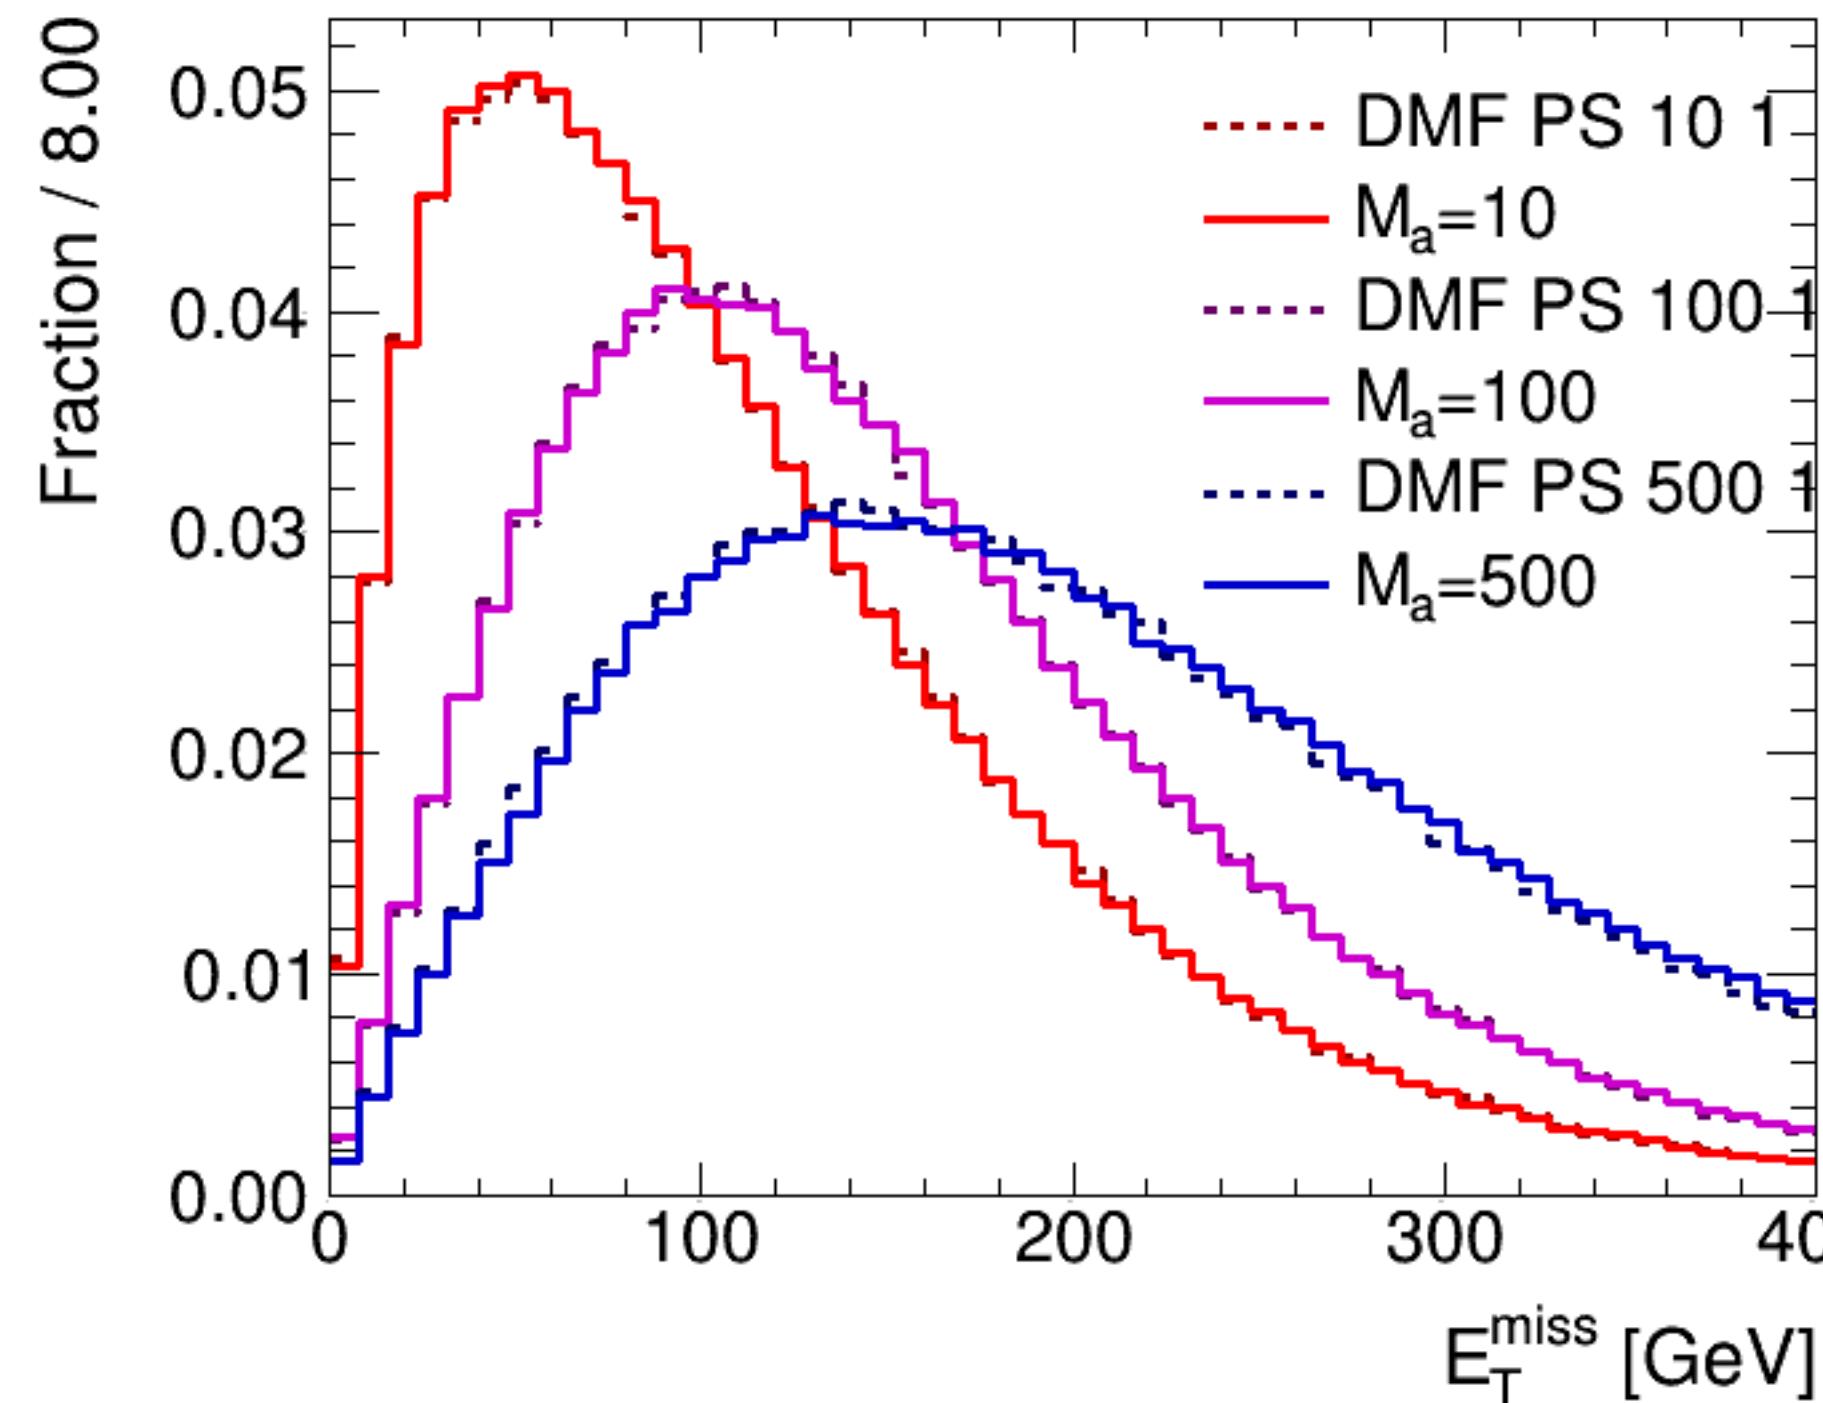

$\sin\theta=0.7071$, $M_H=M_{H^\pm}=750$, $M_h=125$, $M_A=750$, $M_a=300$, $M_{DM}=1$

MET has no dependence on $\tan\beta$

Compare with simplified models

2HDM parameters: $\sin\theta=0.7071$, $M_H=M_{H^\pm}=750$, $M_h=125$, $M_A=750$, $M_{DM}=1$

- Comparison with DMF pseudoscalar simplified models where $g_q = g_{DM} = 1$ and $M_{DM} = 1$ show same kinematics as 2HDM model for $M_{MED}=M_a$
- For $M_A > M_a$ inclusive cross-sections scale as $\sigma_{2\text{HDM}} \sim 0.5\sigma_{\text{DMF}}$

$$\frac{\sigma(pp \rightarrow t\bar{t} + E_T^{\text{miss}})}{\sigma(pp \rightarrow t\bar{t} + E_T^{\text{miss}})_{\text{DMF}}} \simeq \left[\frac{y_\chi \sin\theta}{g_\chi g_q \tan\beta} \right]^2$$

M_{MED}/M_a [GeV]	$\sigma_{2\text{HDM}}$ [pb]	σ_{DMF} [pb]
10	0.220	0.446
100	0.098	0.194
500	0.0035	0.0056

Conclusions

- Kinematic dependence: harder MET spectra with increasing M_a/M_A
 - Kinematics are similar but not identical when swapping M_a and M_A (case 1 v. case 2)
- No dependence of kinematics on variation of $\sin\theta$ or $\tan\beta$
 - Diagrams generated for $t\bar{t}+X\bar{X}$ are symmetric wrt A (h3) and a (h4)
 - Cross sections do change
- Same kinematic dependence as DMF PS model ($M_{DM} = g_q = g_{DM} = 1$) for 2HDM where $M_a = M_{med}$ from DMF
 - Straightforward scaling between model cross sections is confirmed for $M_A > M_a$
