Motivations for precise hadronic cross section measurements

- Tests of perturbative QCD
 - QCD sum rules, quark masses, quark and gluon condensates
 - Higher order QCD corrections - Λ_{QCD} , $\alpha(s)$
- Hadronic corrections to fundamental parameters:
 - Running fine structure constant - $\alpha(M_z^2)$
 - Anomalous magnetic moment of the muon
- measurement of parameters of light vector mesons ρ , ω , ϕ , ρ' , ρ'' ,
- Search of and study of the exotic resonance states (X, Y, Z, ...)
- Study of the final states dynamics and test of theoretical models
- comparison with spectral functions of the hadronic tau decays via CVC
- Study of nucleon-antinucleon pair production – nucleon electromagnetic form factors, search for NNbar resonances, ..

a_μ - SM calculations and experiment

Muon anomaly, $a_m = (g-2)_m/2$

$$a_\mu^{\text{theory(SM)}} = a_\mu^{\text{QED}} + a_\mu^{\text{weak}} + a_\mu^{\text{had}}$$

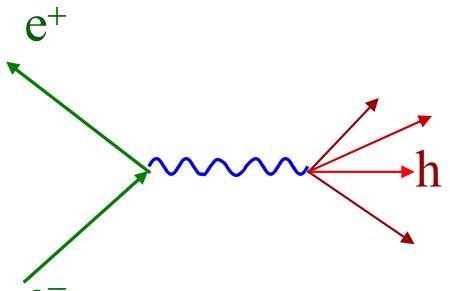

Source	Value (10^{-10})	Uncertainty (10^{-10})
QED	11 658 471.895	0.008
Weak	15.4	0.2
Hadronic + LbL	693.0	4.9
BNL E821	11 659 208.9	6.4
BNL – SM Theory	28.7	8.0

$$a_\mu^{\text{had}} = \frac{\alpha^2}{3 \cdot \pi^2} \int_{4m_\pi^2}^{\infty} ds \cdot \frac{K(s)}{s} \cdot R(s)$$

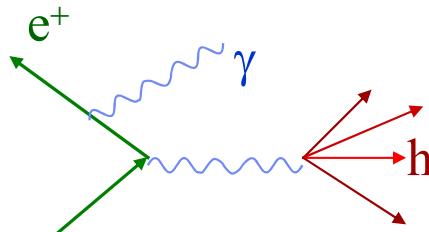

$$R(s) = \frac{\sigma(e^+e^- \rightarrow \gamma^* \rightarrow \text{hadrons})}{\sigma(e^+e^- \rightarrow \mu^+\mu^-)}$$

$$a_\mu^{\text{EXP}} - a_\mu^{\text{SM}} = 3.6\sigma \quad (\text{M. Davier et al., EPJC71(2011)1515})$$

Present data: Direct energy scan and ISR

$$E_{CM}^h = \sqrt{s}$$

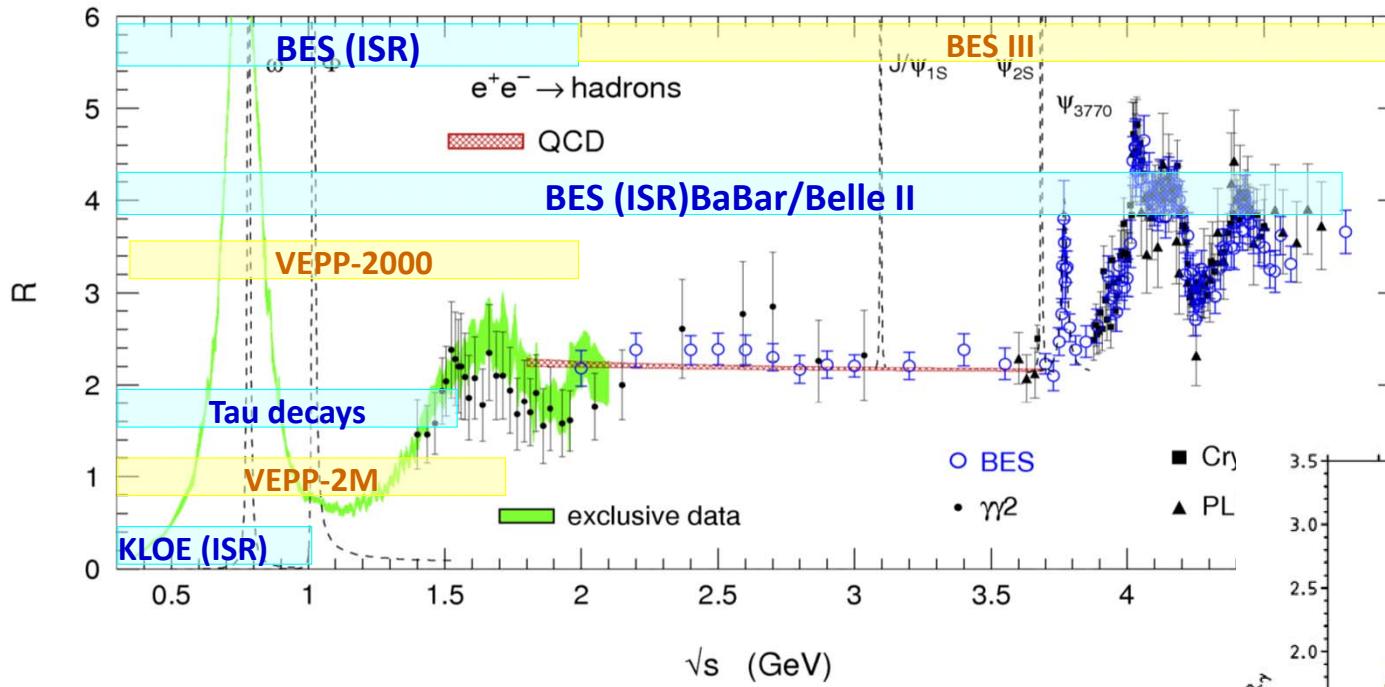

$$E_{CM}^h = M_{inv}^h = \sqrt{\sqrt{s}(\sqrt{s} - 2E_\gamma)}$$

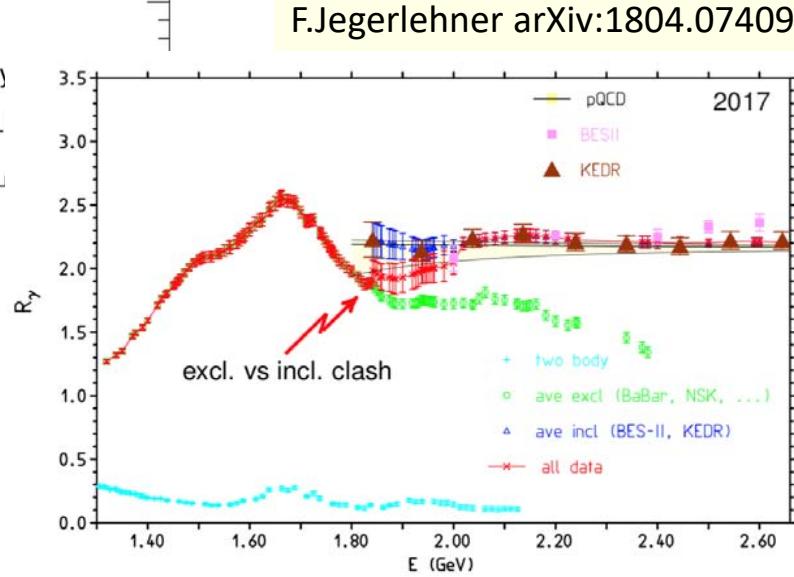

Scan: Novosibirsk – scan (CMD-2/SND at VEPP-2M, $0.36 < \sqrt{s} < 1.4$ GeV, CMD-3/SND at VEPP-2000, $2m < \sqrt{s} < 2.0$ GeV)
BES, BES II, BES III – Beijing 2-5 GeV

ISR: SLAC – ISR (BaBar at PEPII, $2m < \sqrt{s} < 5$ GeV)
Frascati – ISR (KLOE/KLOE-2 at DAFNE, $2m < \sqrt{s} < 1.02$ GeV)
BES III

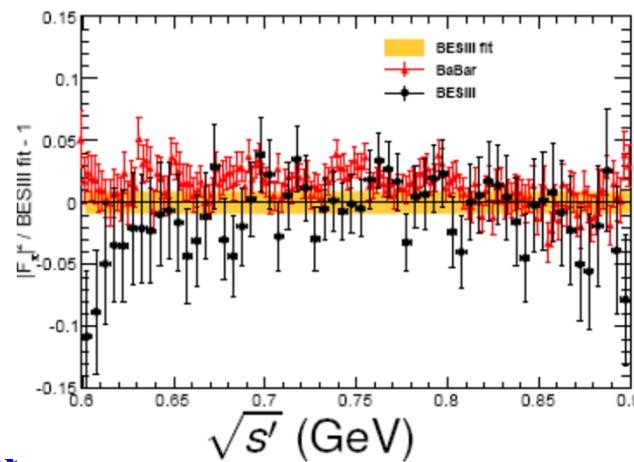

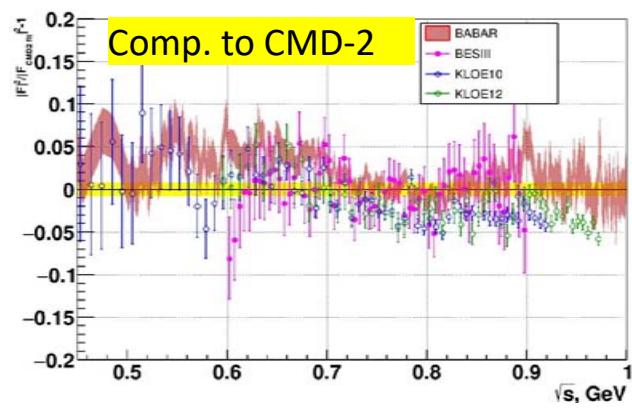

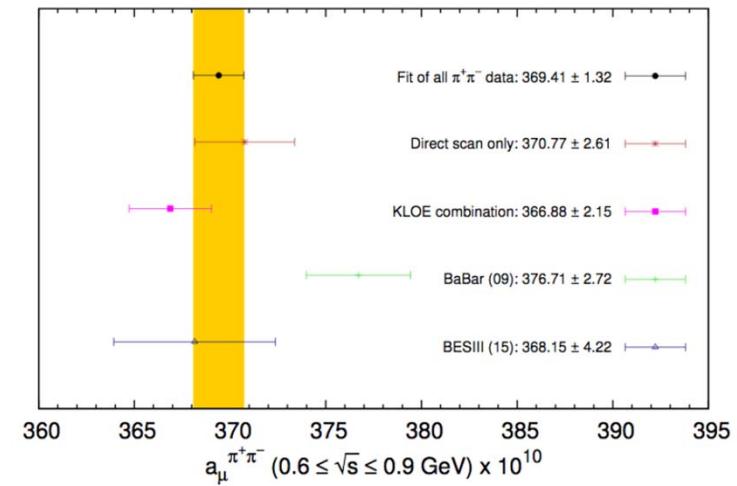

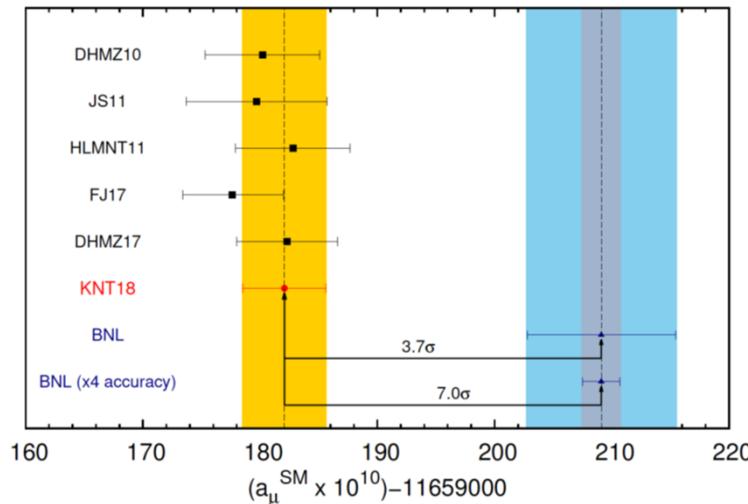

Inclusive vs exclusive measurements

Below 2 GeV R is determined as a sum of the exclusive cross section.
higher ECM – inclusive cross section (systematics?)

Why new more precise measurements are necessary?

E. Solodov. CMD-3, SND Overview

June 2018

12

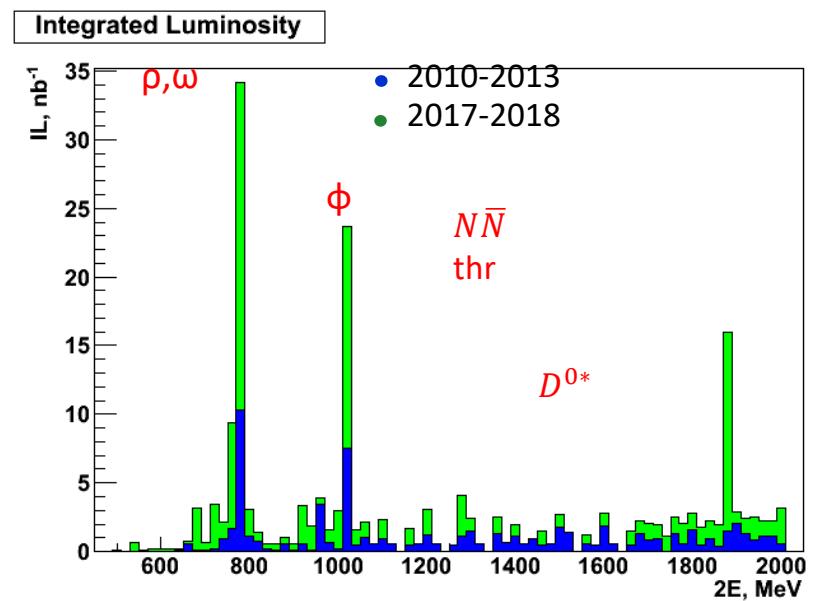

VEPP-2000 collected Luminosity

2010-2013 ~ 55 pb-1/det.

In 2013 we reached 2×160 MeV, the smallest energy ever measured at ee colliders

2017-2018 /per detector
 $e^+e^- \rightarrow D^{0*}$ (2.007 GeV) **pb-1**

$p\bar{p}$ and $n\bar{n}$ threshold 14 pb-1

Overall:

1.28 – 2.007 GeV 50 pb-1

0.55 – 1.00 GeV 70 pb-1

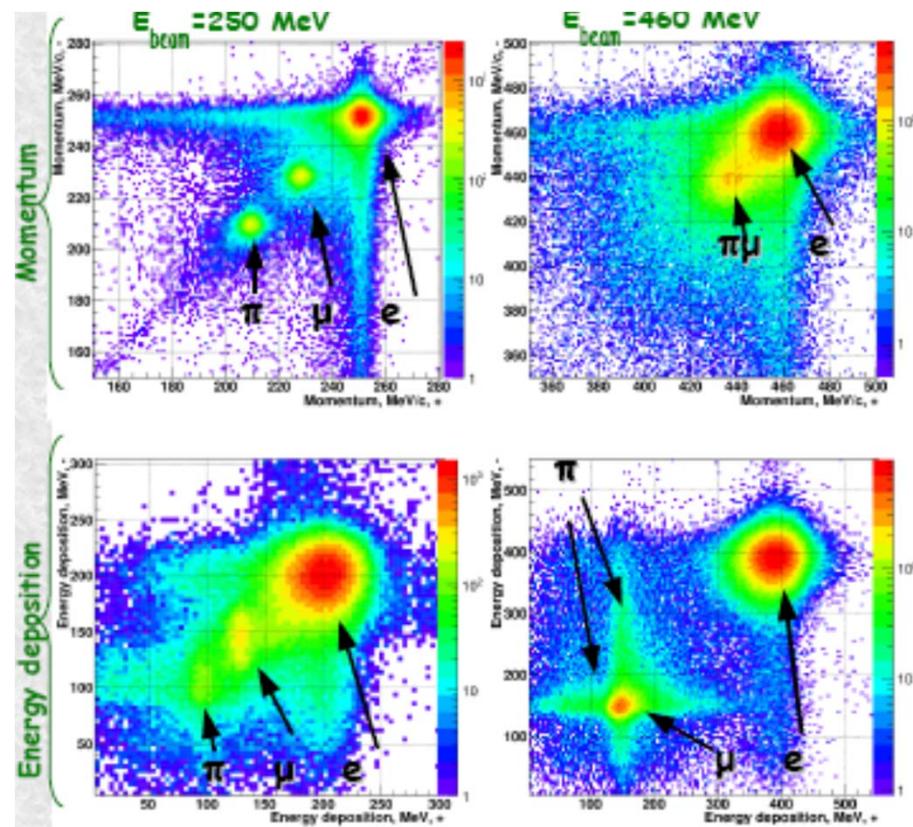

Dominant channel $e^+e^- \rightarrow \pi^+\pi^-$

Separation of $e^+e^- \rightarrow e^+e^-, \pi^+\pi^-, \mu^+\mu^-$ events by particle momenta and energy deposition in the calorimeter

Two charge tracks collinear back-to-back events are selected

$$|F_\pi|^2 = \frac{N_{\pi\pi}}{N_{ee}} \frac{\sigma_{ee}^B (1 + \delta_{ee}) \varepsilon_{ee}}{\sigma_{\pi\pi}^B (1 + \delta_{\pi\pi}) \varepsilon_{\pi\pi}}$$

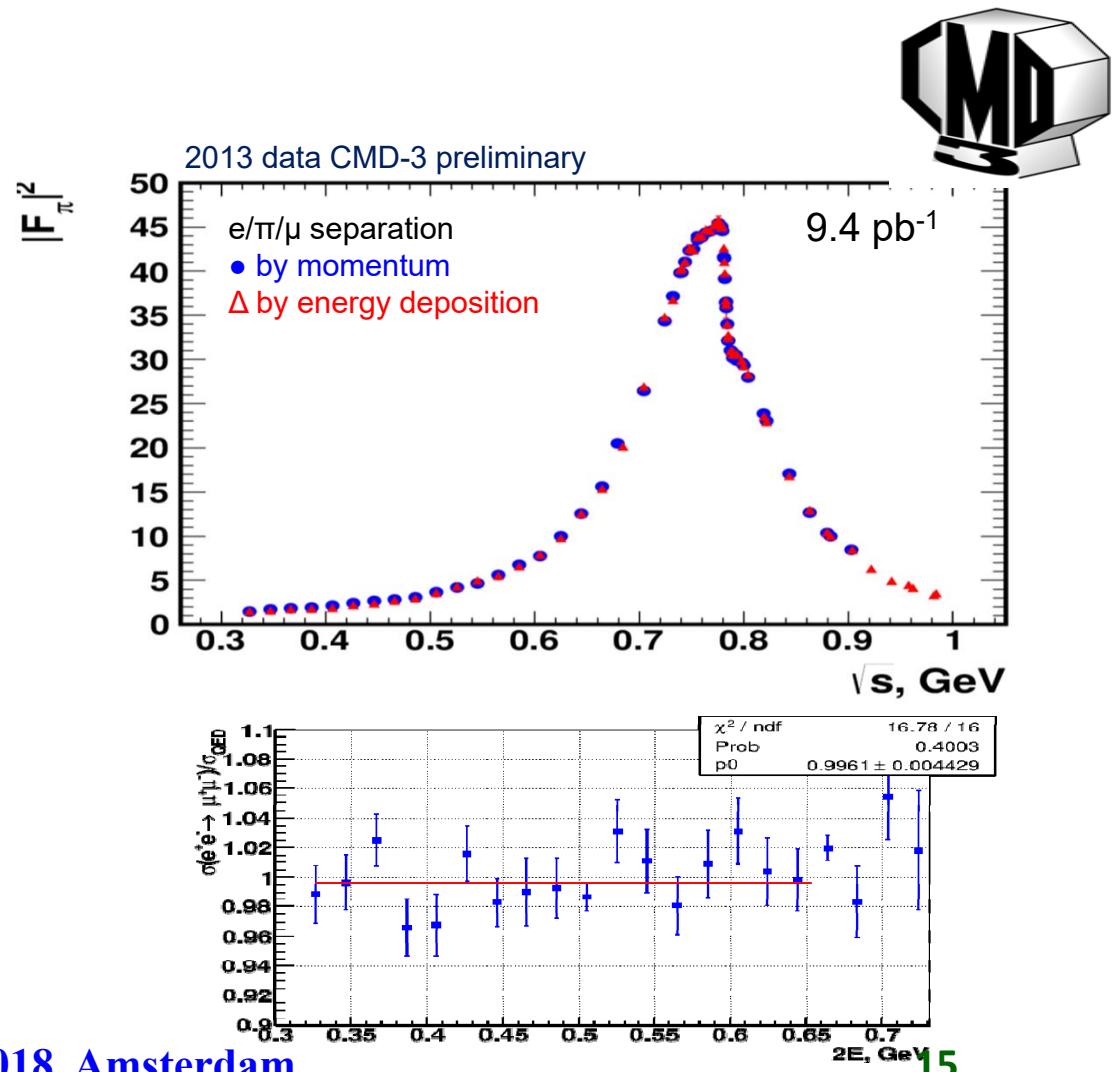

Dominant channel $e^+e^- \rightarrow \pi^+\pi^-$

Source	Goal	Current estimation
Radiative Correction	0.2%	0.2% (cross-section) 0.0-0.4% (mom.sep.)
Event separation	0.2%	0.1-0.5% (mom. sep.) ~1.5% (energy sep.)
Fiducial volume	0.1%	ok
Beam energy	0.1%	ok
Pion corrections (decay, nucl.int.)	0.1%	0.1% -nucl. int. 0.6-0.3% decays at low energies
Combined	0.33%	0.4-0.9% (mom.sep.) 1.5% (energy sep.)

Some corrections are not applied
(result is still “blinded”)
Hope to finalize it later this year

2017: $e^+e^- \rightarrow p\bar{p}$ at NN threshold

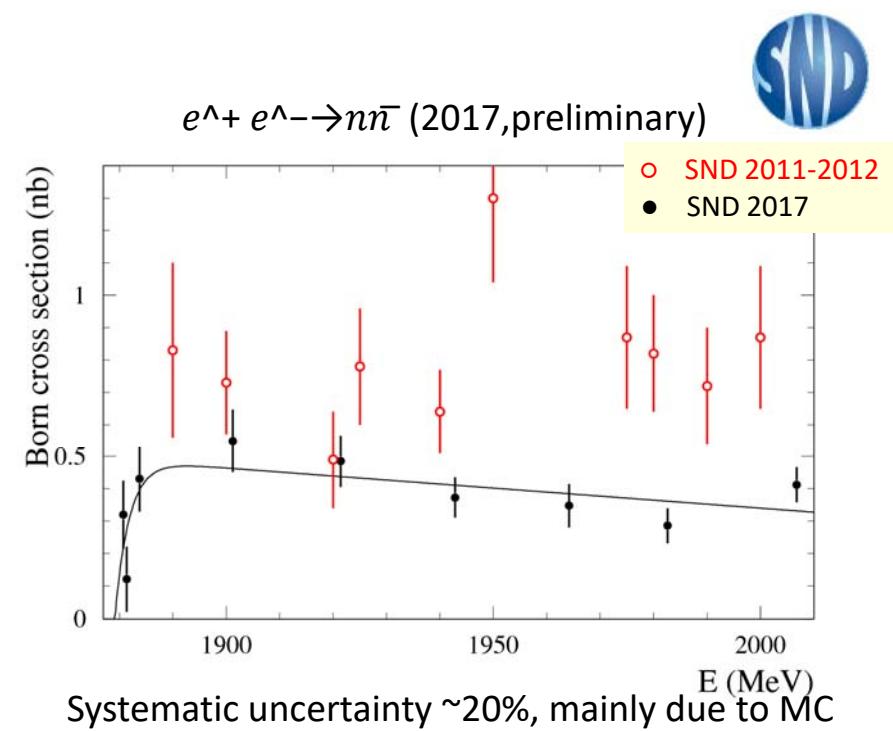

A. I. Milstein and S. G. Salnikov, Nucl. Phys. A 977 , 60 (2018)

27.09.2018

TAU – 2018, Amsterdam

In 2017 CMD-3 and SND has performed the scan at the NNbar threshold with a step smaller than c.m. machine energy spread (1.2 MeV). The $e^+e^- \rightarrow p\bar{p}$ cross section demonstrate exponentially fast rising in about 1 MeV interval.

19

2017: $e^+e^- \rightarrow 3(\pi^+\pi^-)$ at $N\bar{N}$ threshold

arXiv:1808.00145v2

CMD-3 has confirmed fast drop of the cross section, and new scan shows the scale of the drop consistent with $p\bar{p}$ cross section rise ~ 1 MeV.

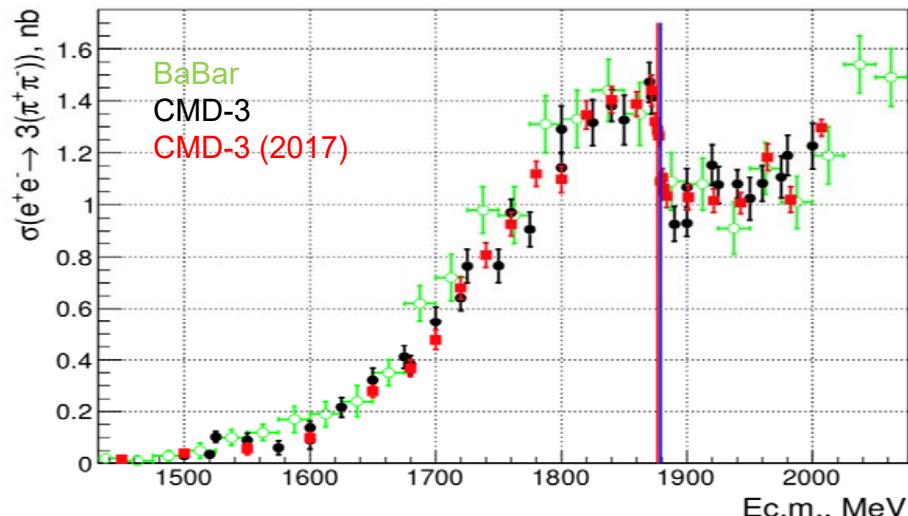

Figure 1: The $e^+e^- \rightarrow 3(\pi^+\pi^-)$ cross section measured with the CMD-3 detector at VEPP-2000 in 2017 run (squares). The results of previous CMD-3 measurements [6] are shown by dots, when BaBar measurement [4] are shown by open circles. The lines show the $p\bar{p}$ and $n\bar{n}$ thresholds.

27.09.2018

TAU – 2018, Amsterdam

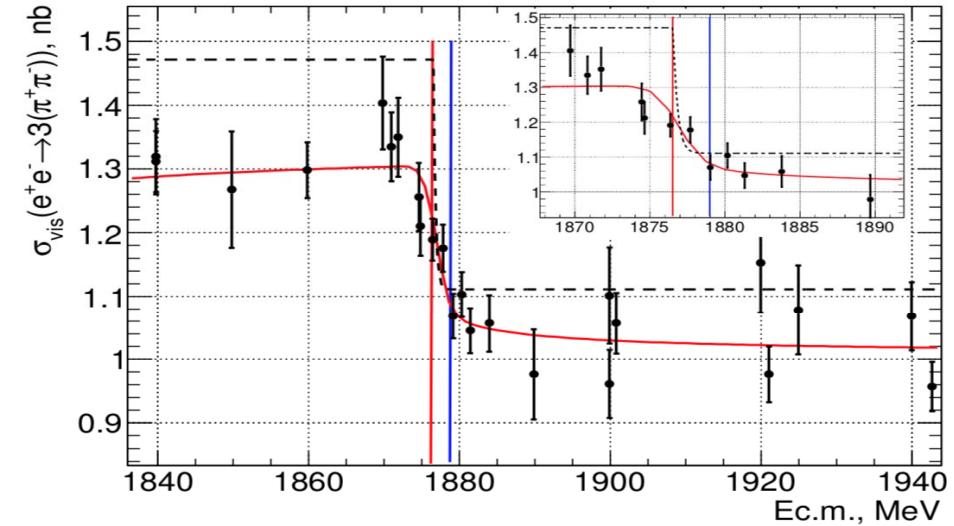

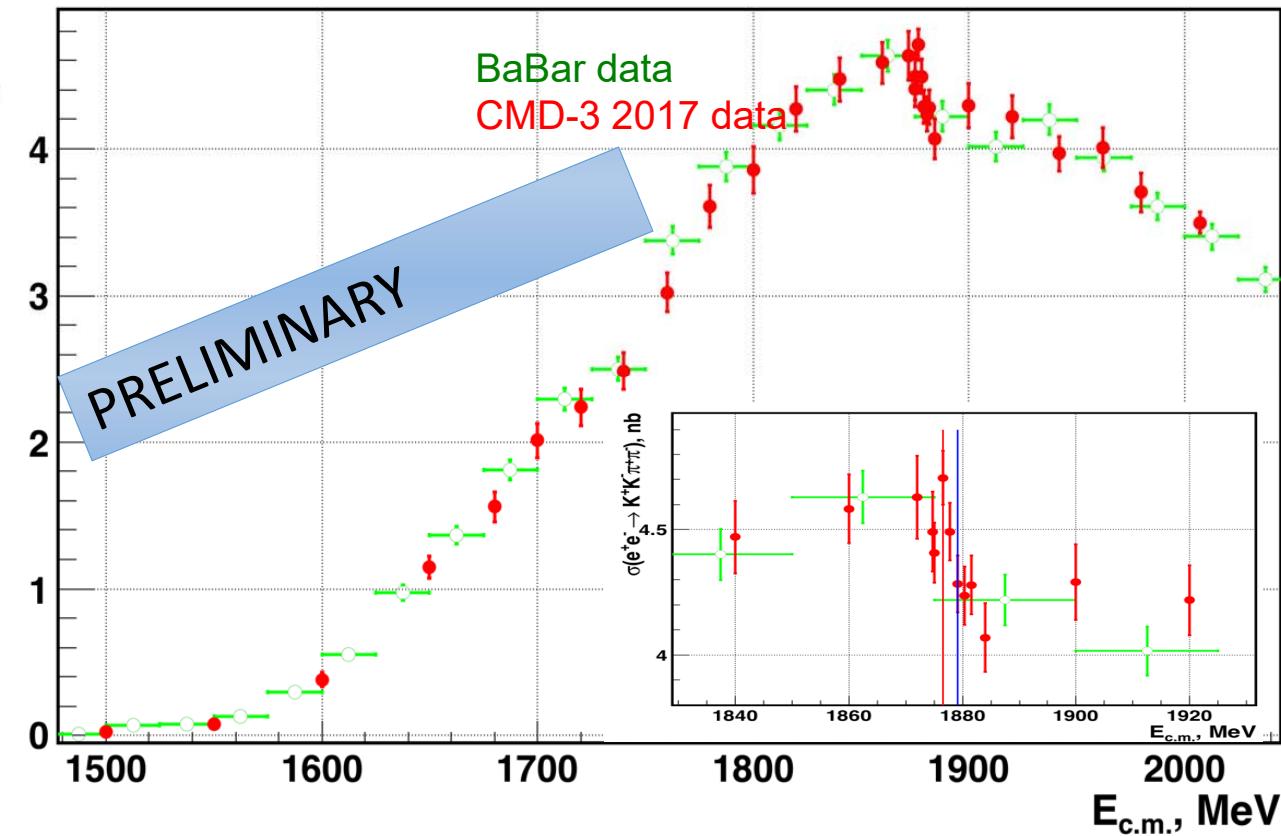

Figure 3: The $e^+e^- \rightarrow 3(\pi^+\pi^-)$ visible cross section measured with the CMD-3 detector. Solid curve shows fit with Born cross section (dashed curve) convoluted with 1.2 MeV energy spread and radiation function. The vertical lines show the $p\bar{p}$ and $n\bar{n}$ thresholds.

20

NEW! Structure in $e^+e^- \rightarrow K^+K^-\pi^+\pi^-$

No indication of NNbar threshold in the $e^+e^- \rightarrow 2(\pi^+\pi^-)$ reaction!

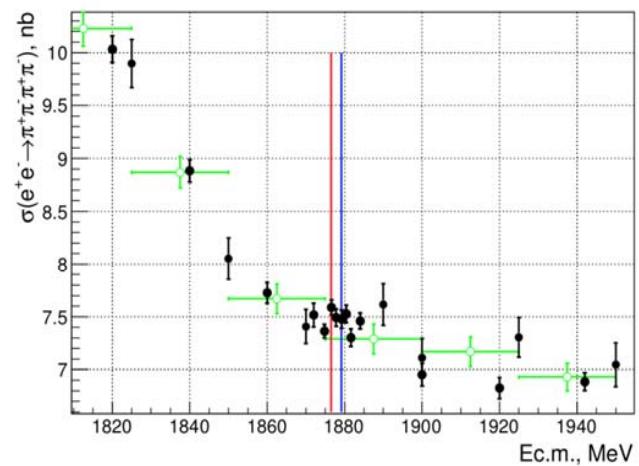

Figure 4: The $e^+e^- \rightarrow 2(\pi^+\pi^-)$ cross section measured with the CMD-3 detector. Lines show the $p\bar{p}$ and $n\bar{n}$ thresholds.

One more channel, where NN threshold structure has been observed!

TAU – 2018, Amsterdam

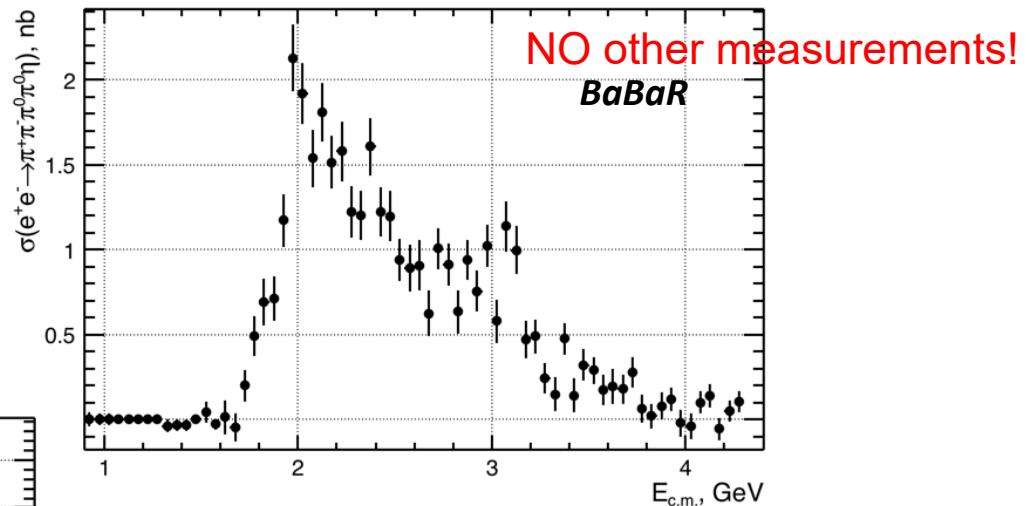

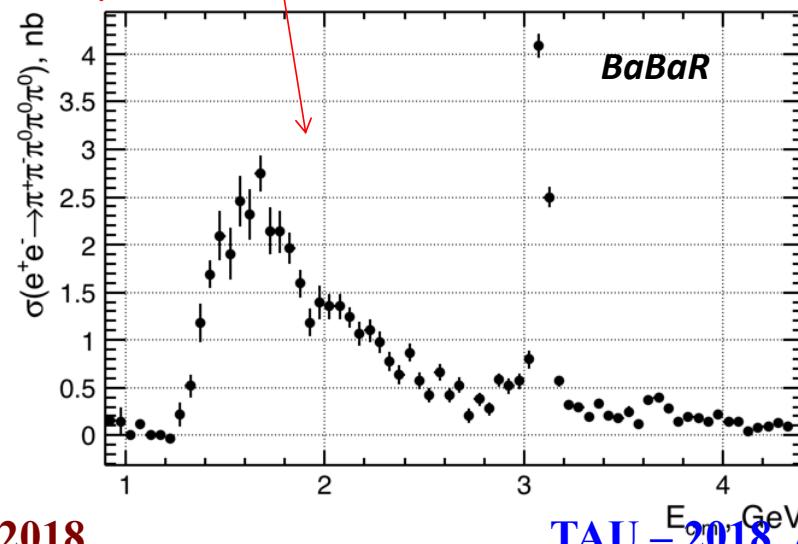

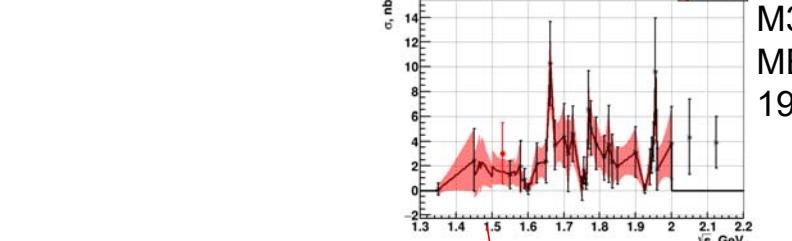

21

BaBar ISR analyses

22 final states were studied, ~20 papers on low energy ISR studies were published

Study of the $e^+e^- \rightarrow \pi^+\pi^-\pi^0\pi^0\pi^0$, $\pi^+\pi^-\pi^0\pi^0\eta$ processes from ISR at *BaBar* (NEW, preliminary)

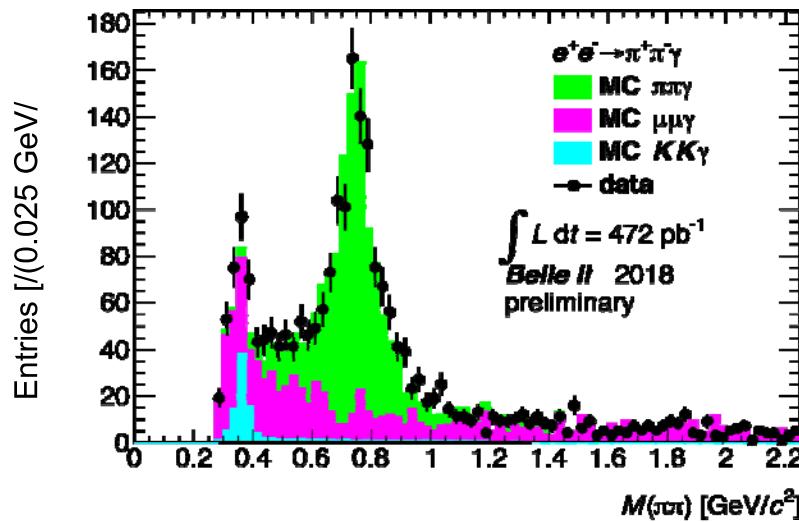

BaBar has a wide program of the hadronic cross section measurement using ISR, including $\pi^+\pi^-$ channel. Analysis is ongoing!

See poster by E. Solodov

Belle II first look to ISR (Phase II)

Events with one photon
 $(E\gamma > 3 \text{ GeV}, 50 < \theta < 110)$
 and 2 tracks from IP were selected
 and $10 < E_{\text{tot}} < 11 \text{ GeV}$.
 Analysis done by Y.Maeda

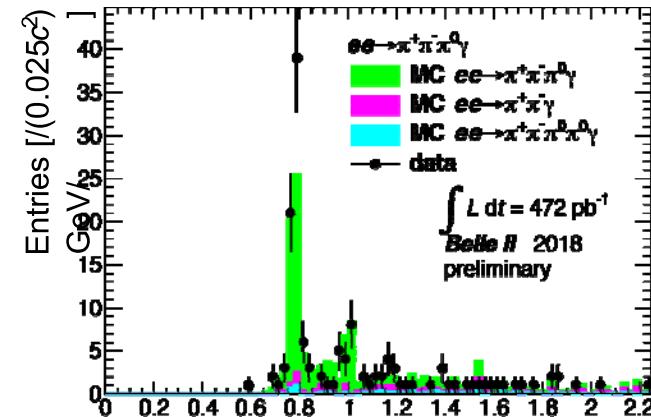

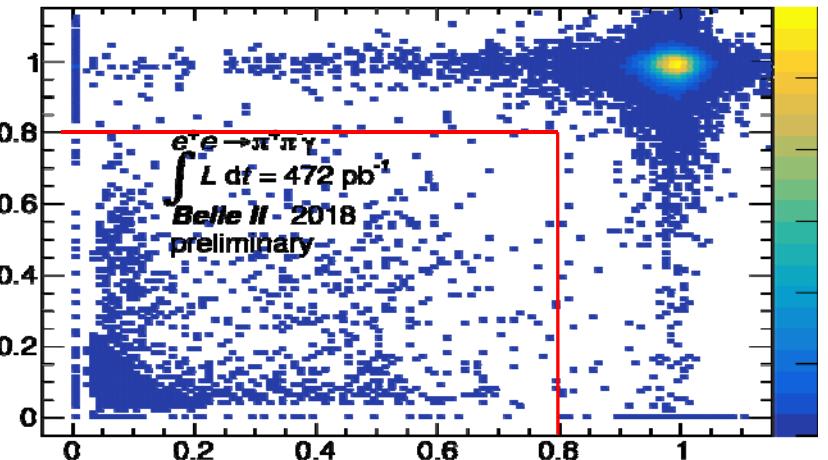

MC cross sections are taken from the Phokhara generator output.

27.09.2018

TAU – 2018, Amsterdam

E/p ratio for each of positive and negative charged tracks.

24

Conclusion

At present a discrepancy between experiment and SM in the muon (g-2) is, probably, the largest among observed.

Two experiments on muon (g-2) measurement are in progress. We anticipate 3-4 times better precision in several years.

The goal of two experiments CMD-3 and SND at VEPP2000 is to provide exclusive measurement of $e^+e^- \rightarrow$ hadrons reactions with high precision in the energy range 0.32 – 2.0 GeV

In 2017 both detectors have collected 50 pb^{-1} in 5 months with c.m. energy scan from 1.68 to 2.0 GeV. At the end of 2017 - beginning of 2018 - 66 pb^{-1} have been collected in 0.55-1.0 GeV

New and more precise experimental data on the hadronic cross section are been waiting from VEPP 2000, BES III, BaBar and Belle II.
