

SHiP-TD inspired design for the ToF system of the ND280 upgrade

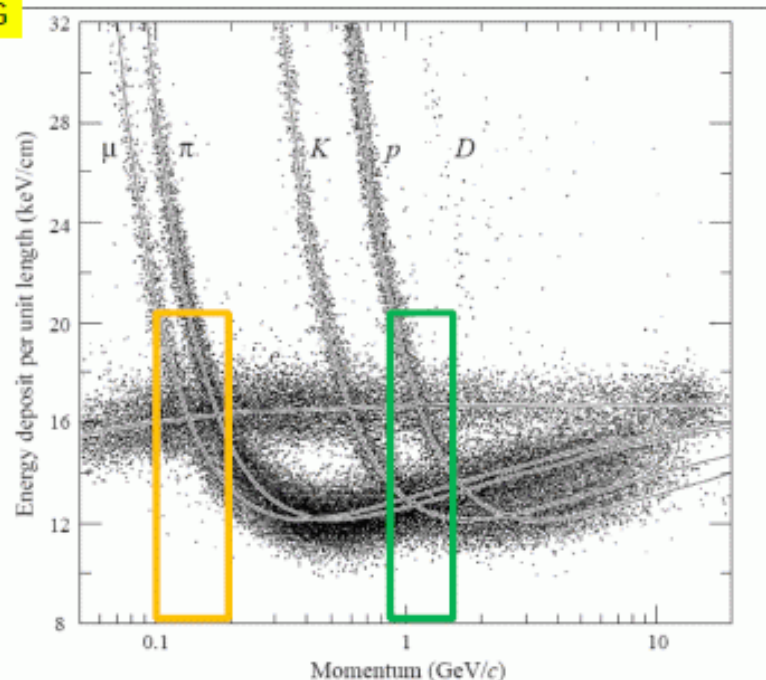

A.Blondel, A.Korzenev, P. Mermoud, D.Sgalaberna / Uni Geneva
D.Gascon, S.Gomez / Uni Barcelona

3-rd workshop on ND280 upgrade
Tokai, May 20, 2017

Motivation for the ToF detector in ND280

dE/dx

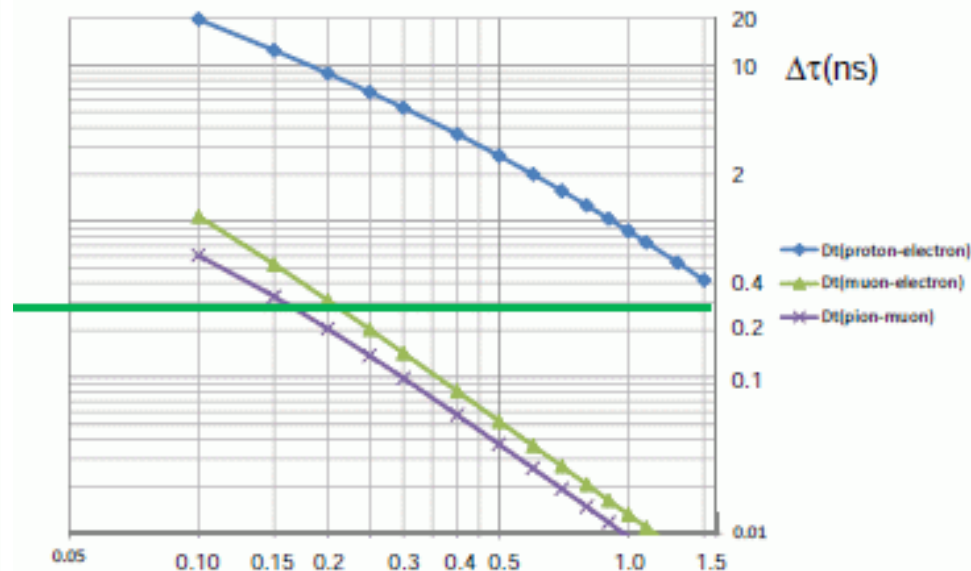

Plot from PDG

mu/e confusion zone : 100-200 MeV/c

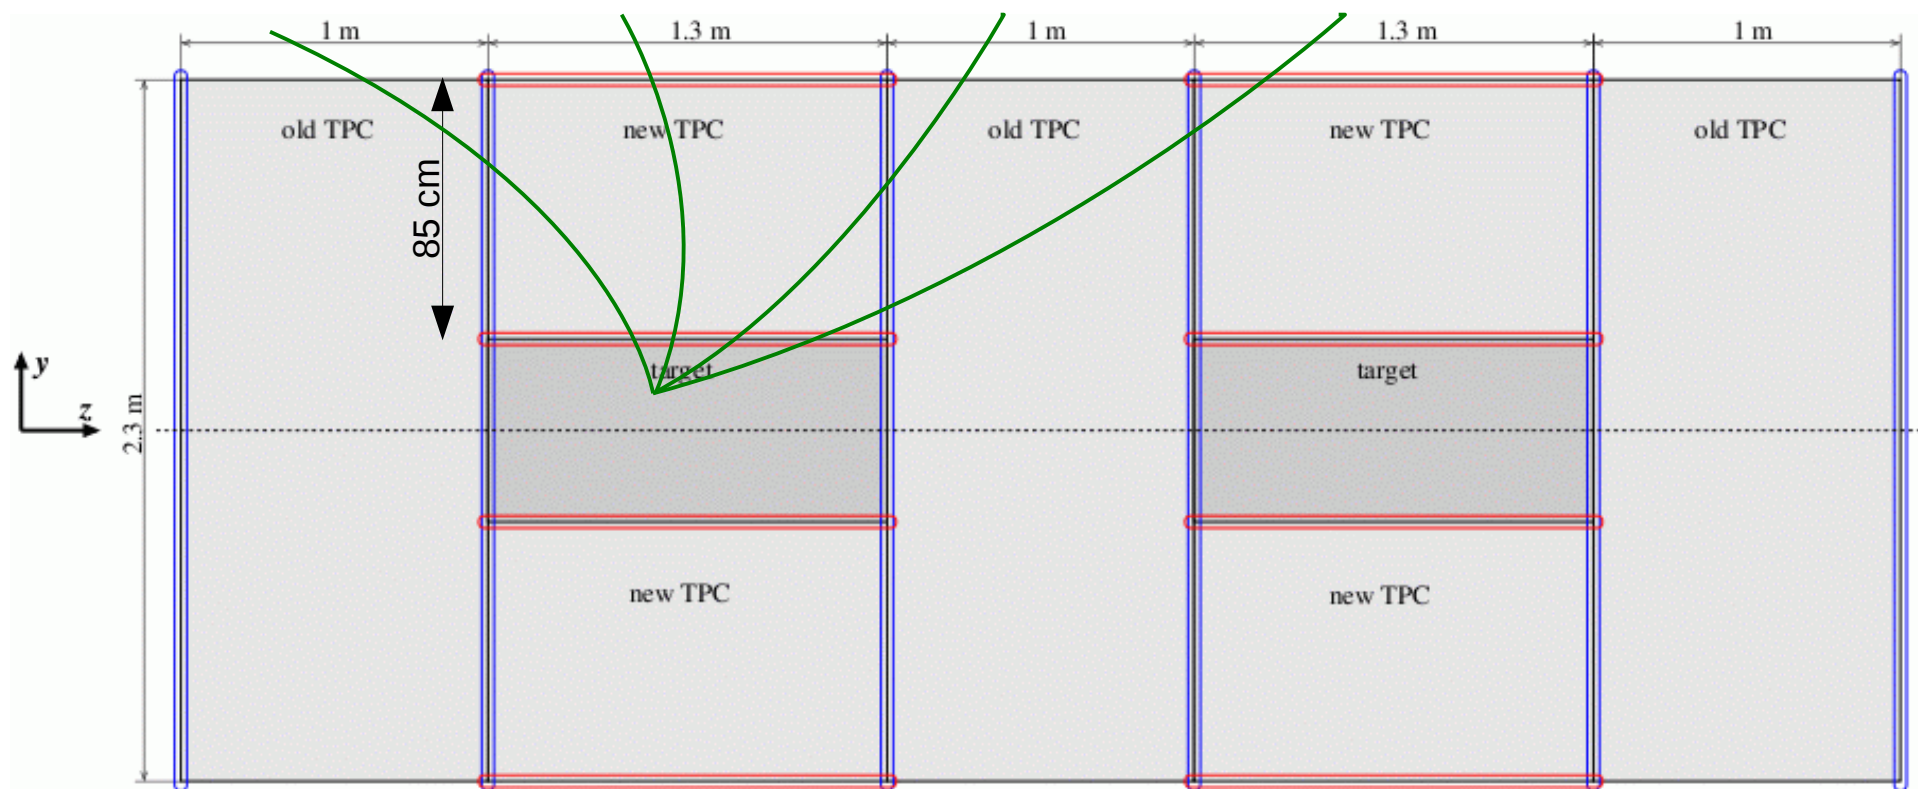

p-e confusion zone 0.9 -1.5 GeV/c

Minimum difference in time of flight between e/mu/pi/proton for a flight of 70cm as function of momentum (not taking into account of bending or angles)

$\Delta\tau$ of 300ps gives 1σ or more
in all cases where needed

Proposal for the use of ToF based on a cast plastic

- 6 modules **XY** with dimensions 230 cm x 230 cm each
- 12 modules (**YZ+XZ**) with dimensions 130 cm x 230 cm each
- All modules can be assembled with bars of 230 cm long
- No space for plastic around old TPCs (???)

ToF mass

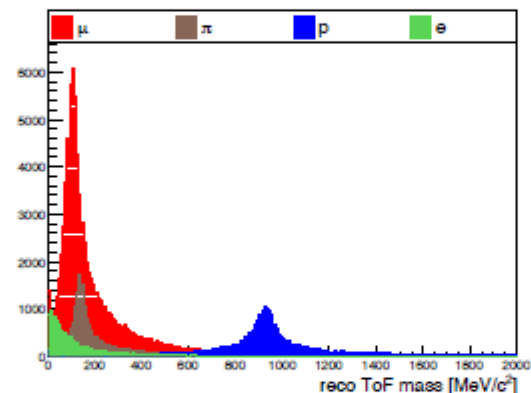

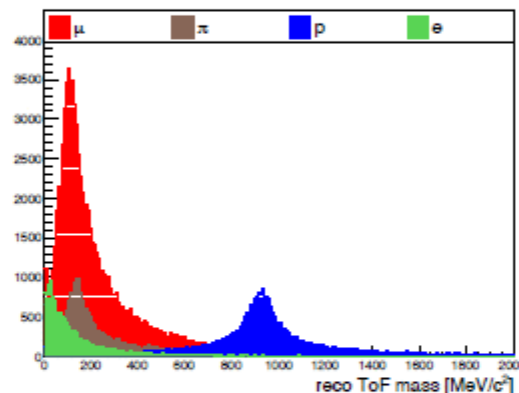

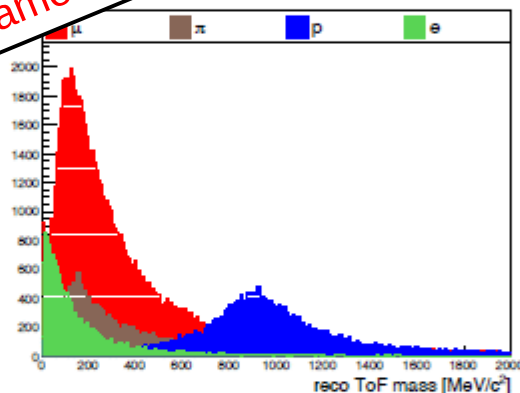

$$m_{ToF} = p \times \sqrt{\frac{c^2(\Delta t_{reco})^2}{L^2} - 1}$$

Sample of preselected ν_μ events

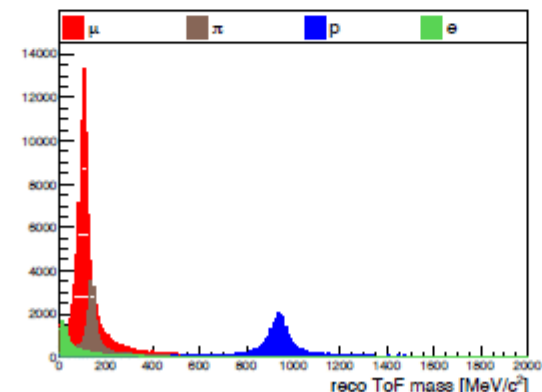

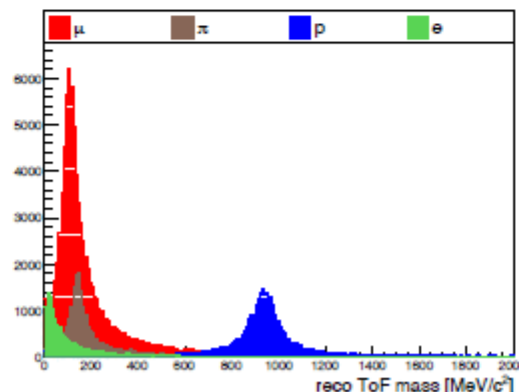

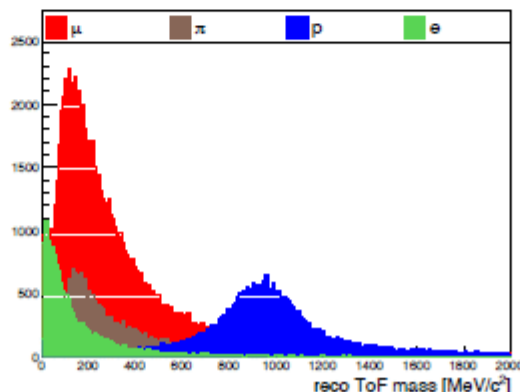

Look at all particles with ToF information (not only highest momentum)

For details see slides
of M. Lamoureux

reference configuration

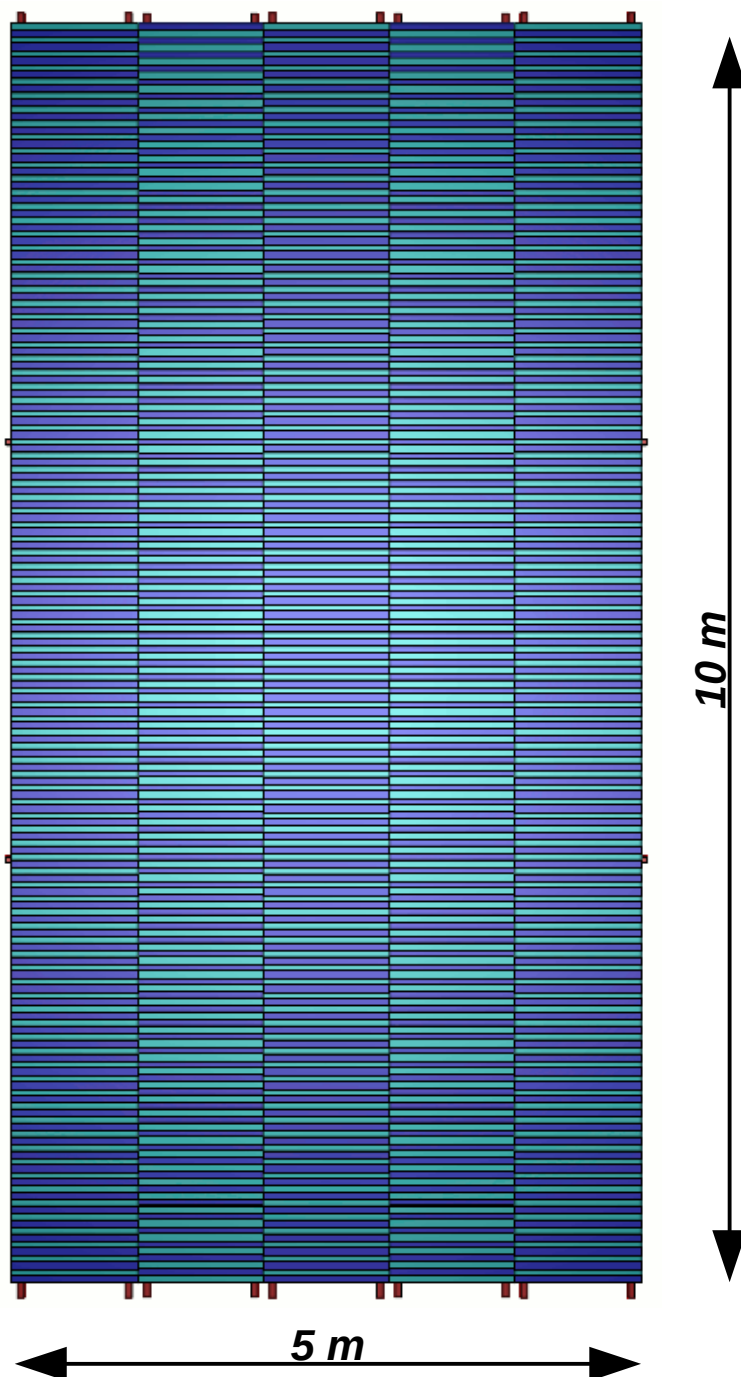

adding new ToF between Target and HTPC

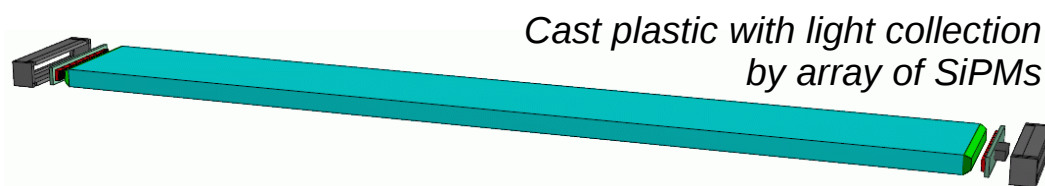

$\sigma_{ToF} = 600 \text{ ps} \uparrow$

$\sigma_{ToF} = 150 \text{ ps} \uparrow$

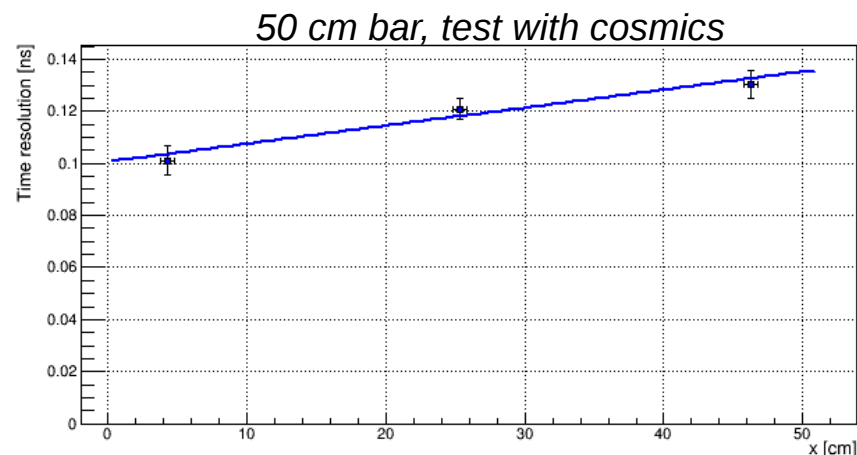

$\sigma_{ToF} = 50 \text{ ps} \uparrow$

Timing Detector in SHiP

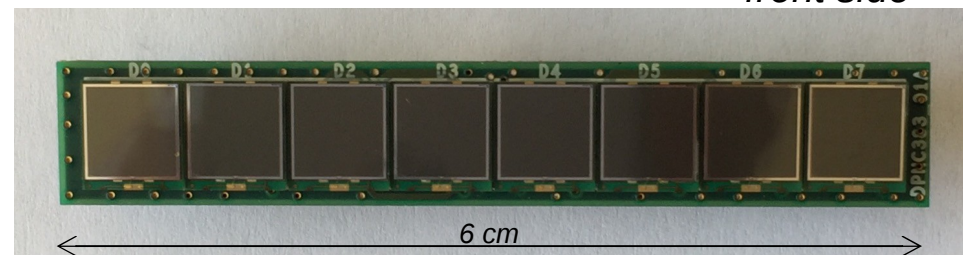

- For the TD of size 5 m x 10 m with a bar **100 cm x 6 cm x 1 cm**
 - 5 col x 182 row = 910 bars =>
 - 910 bars x 2 = 1820 ch =>
 - 1820 x 8 = 14560 SiPMs
- The resolution at 50 cm is ~140 ps => we can use with 1 m bar and 2-side readout to be within 100 ps.

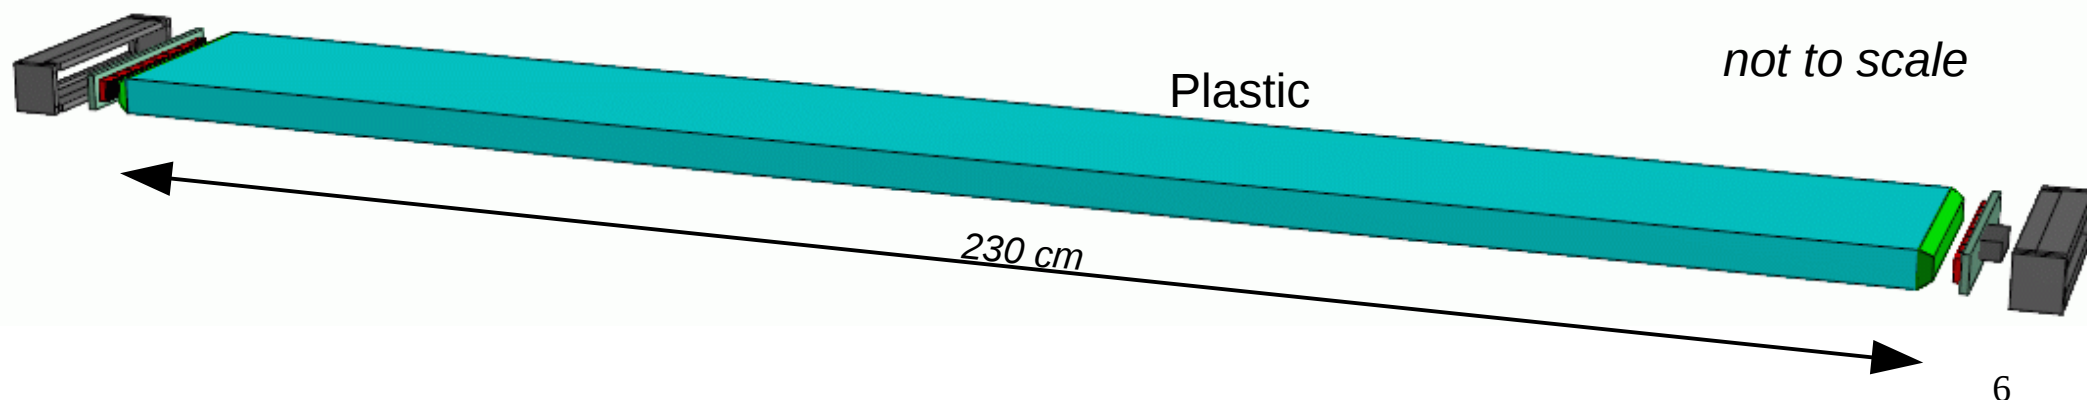

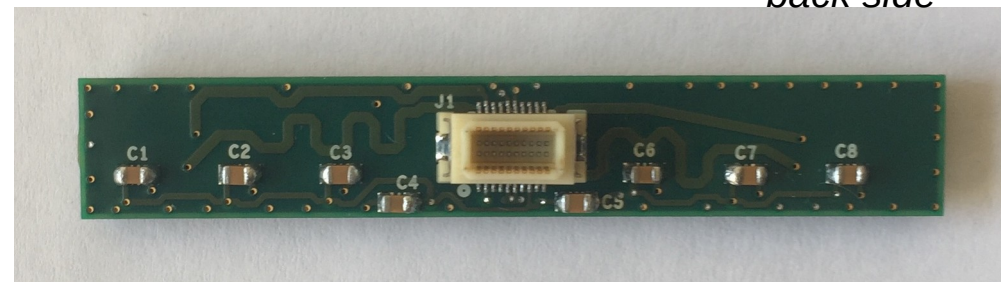

Bar and sensors for ToF/ND280

- Bar: 230 cm x 6 cm x 1 cm
- Plastic material:
 - EJ200 (BC408) or EJ208(BC412)
 - Attenuation length ~ 4 m
 - 1.42 kg/bar
- Readout from both ends
 - 8 sensors of 6 mm x 6 mm
 - Example: S13360-6050PE

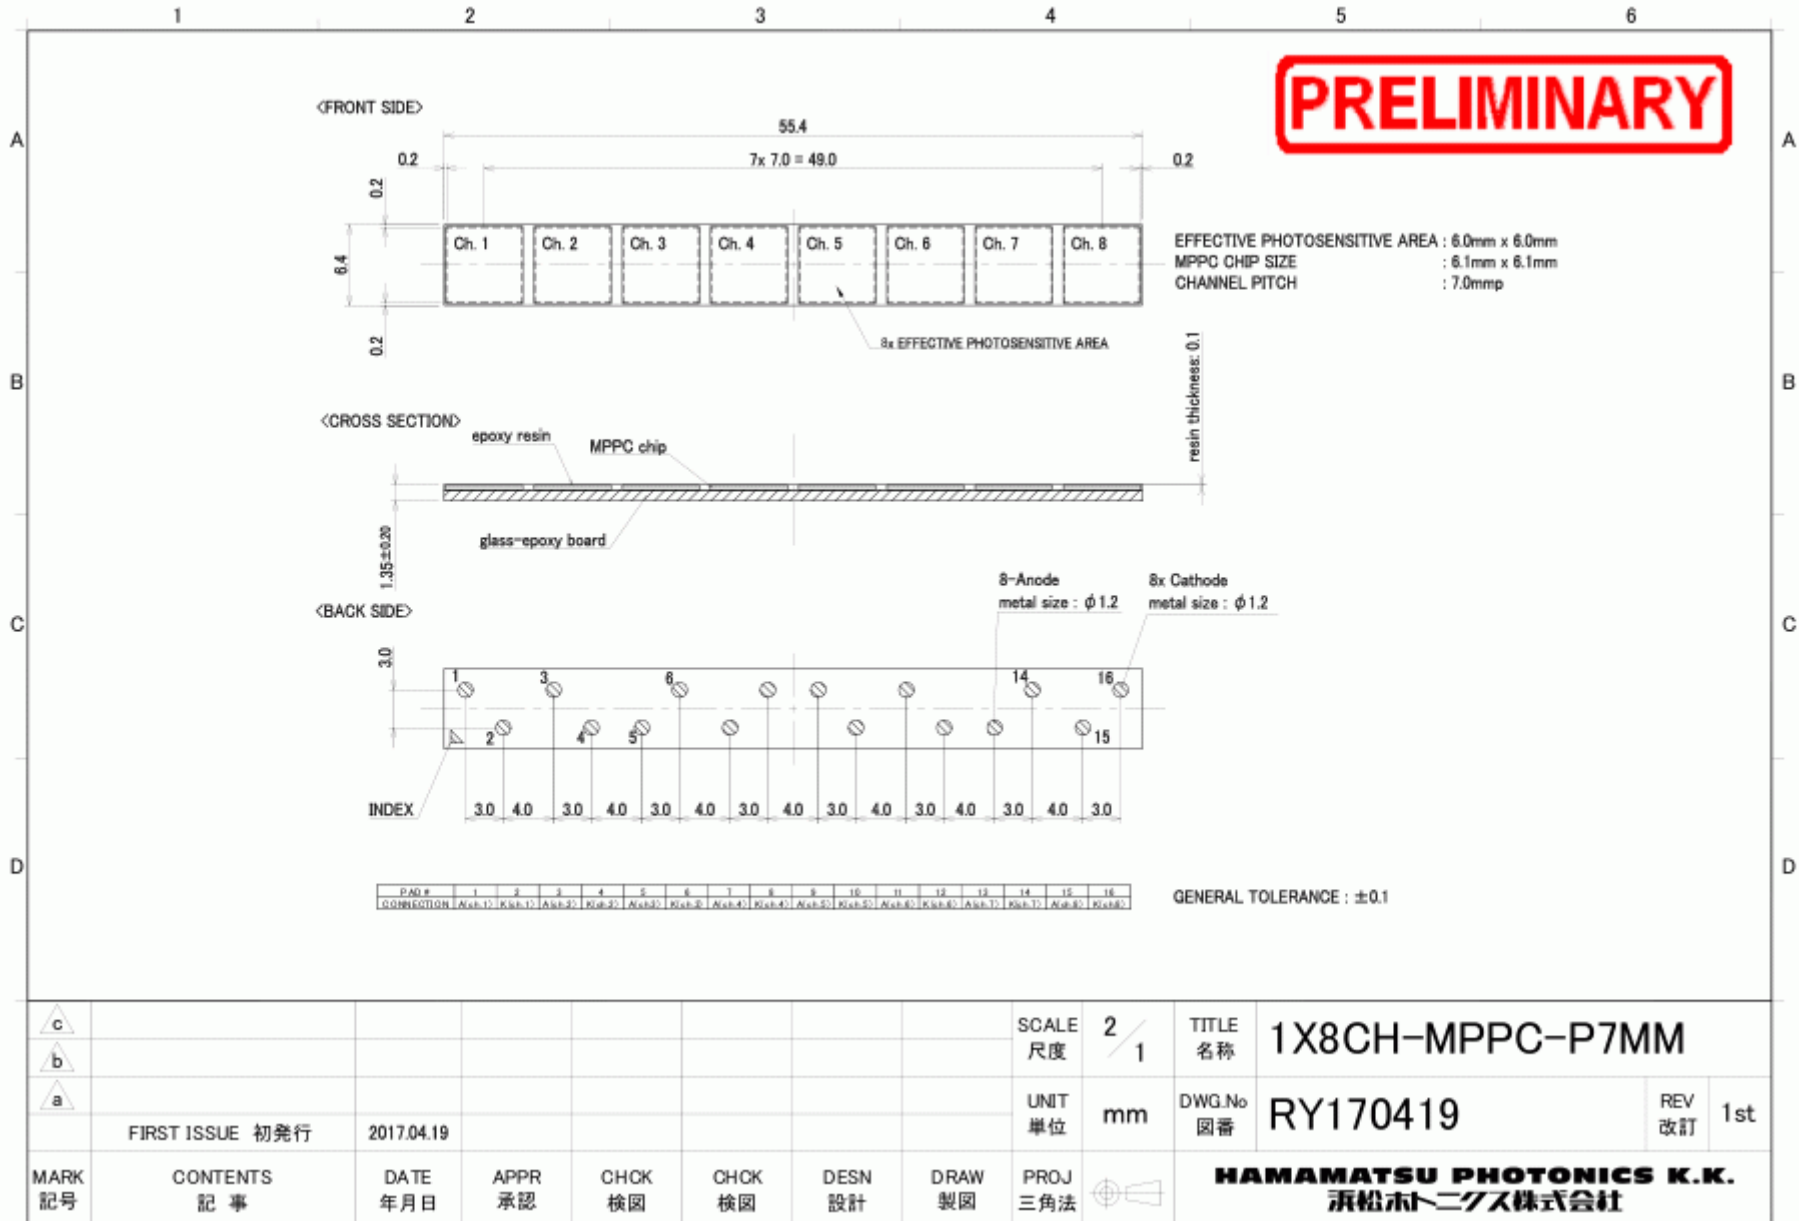

front side

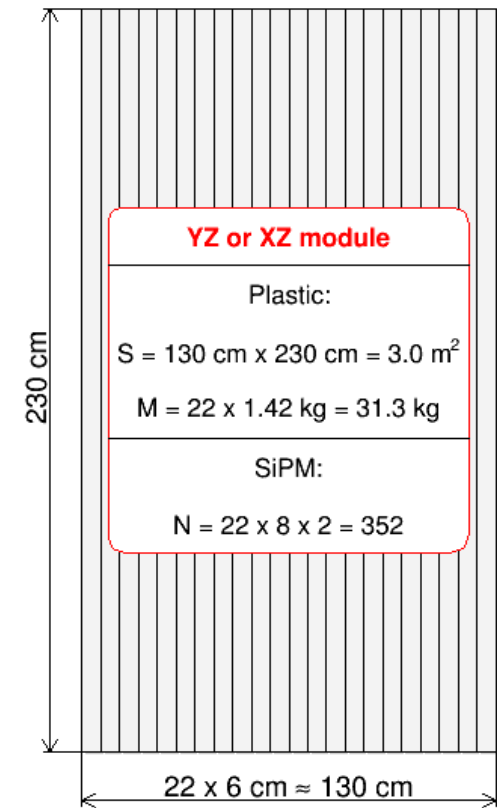

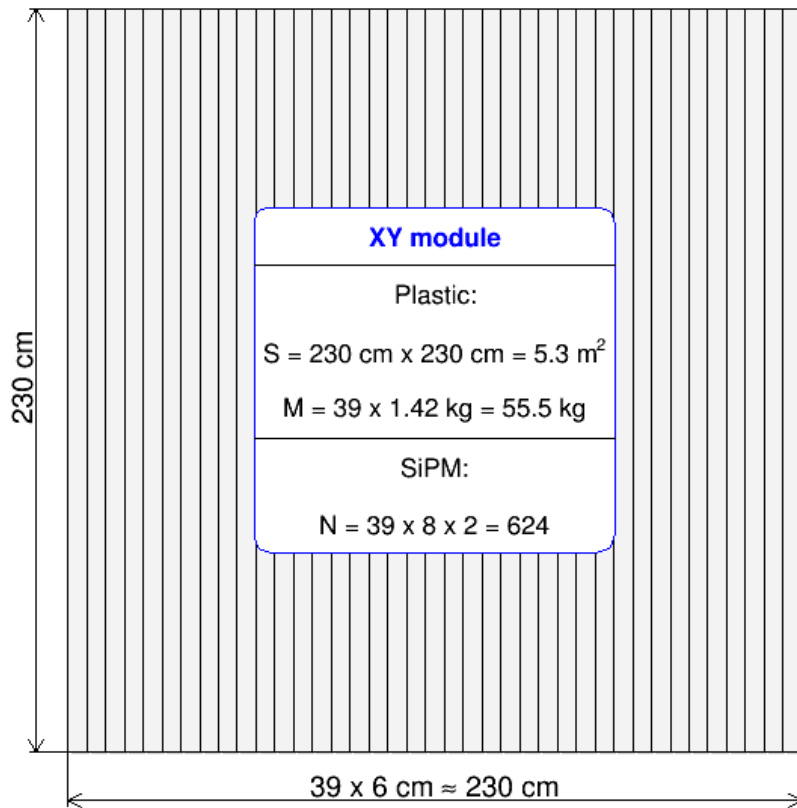

back side

Array of SiPMs (10% cheaper)

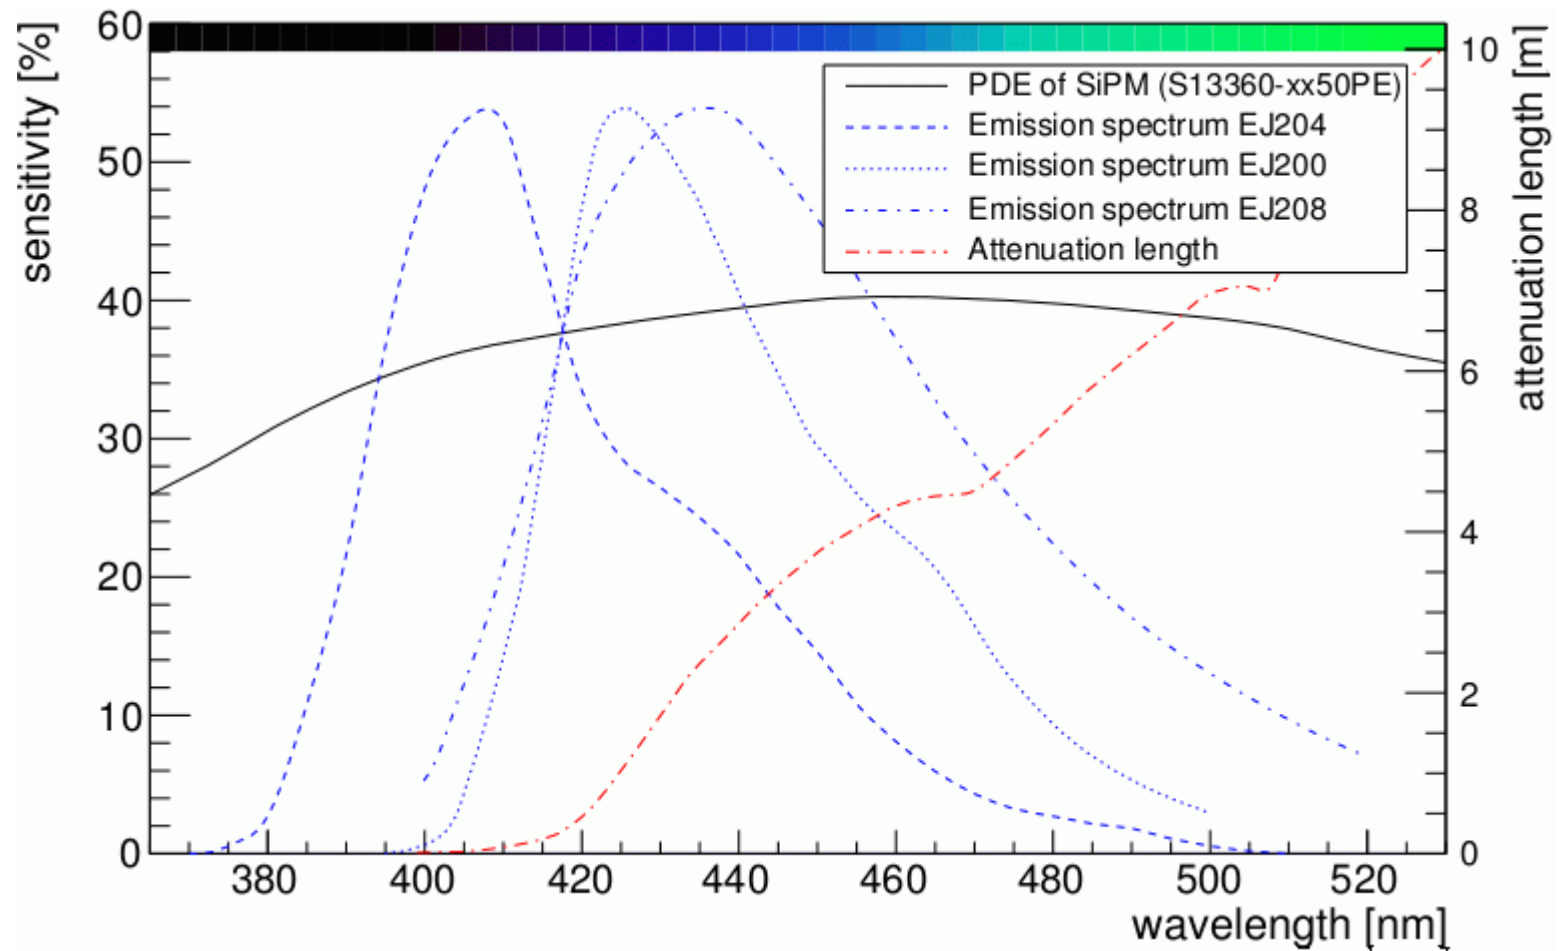

Modules

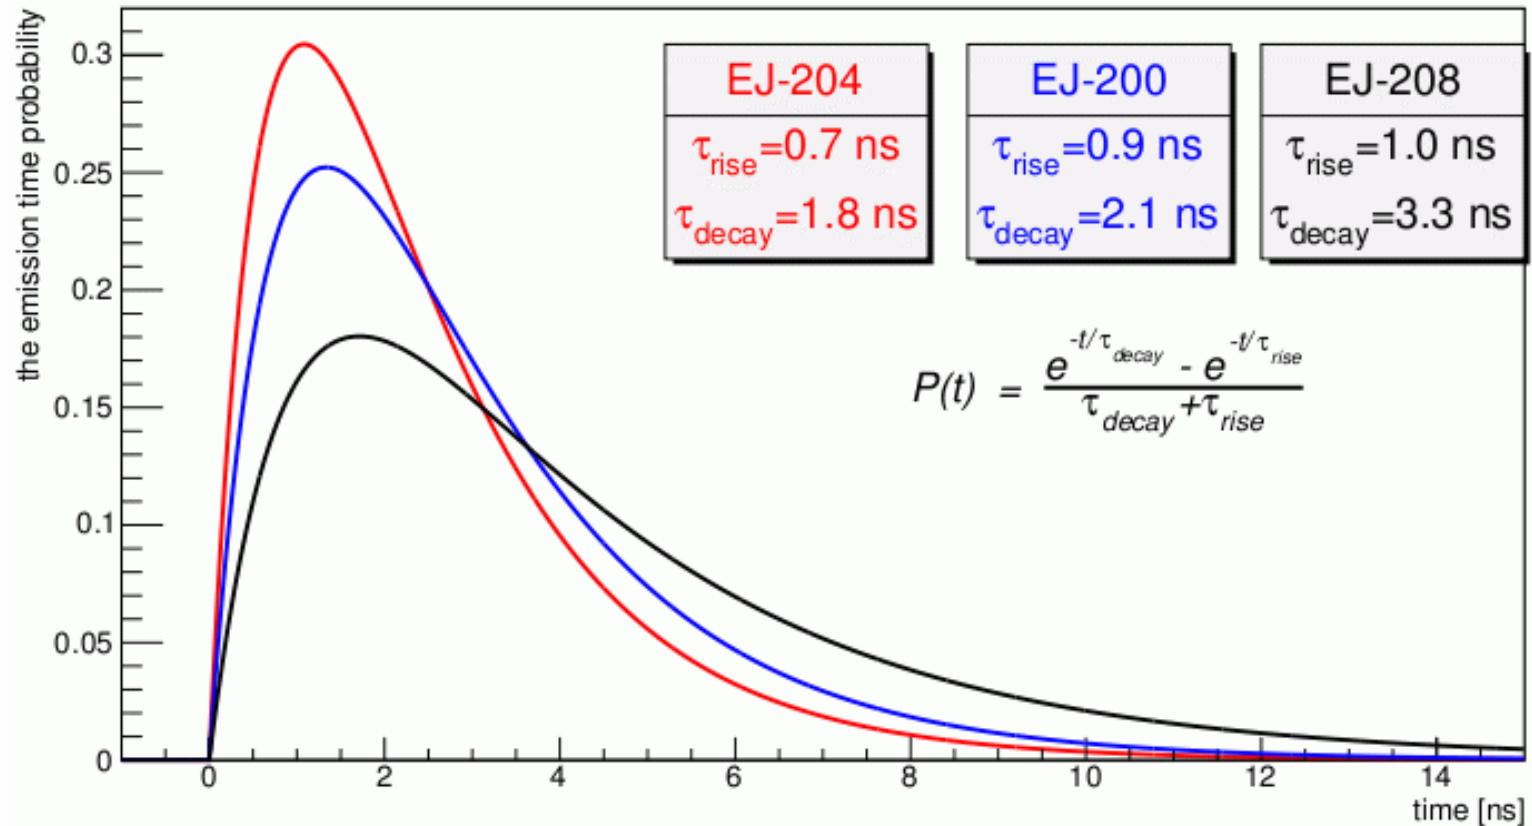

- 6 modules XY and 12 modules (YZ+XZ)
- Surface $6 \times 5.3 \text{ m}^2 + 12 \times 3 \text{ m}^2 = 67.6 \text{ m}^2$, weight 0.7 ton
- Number of bars (230 cm) = 498. Number of SiPMs = $498 \times 2 \times 8 = 7968$
- In case of the 5 mm overlap between bars all estimates to be increased by $5/60=8.3\%$

Choice of plastic material (1)

		$\gamma/1 \text{ MeV } e^-$	Wavelength	Rise time	Decay const	Att. length
EJ-204	BC-404	10.4k	408 nm	0.7 ns	1.8 ns	1.6 m
EJ-200	BC-408	10k	425 nm	0.9 ns	2.1 ns	~3.8 m
EJ-208	BC-412	9.2k	435 nm	1.0 ns	3.3 ns	~4.0 m

Choice of plastic material (2)

		$\gamma / 1 \text{ MeV } e^-$	Wavelength	Rise time	Decay const	Att. length
EJ-204	BC-404	10.4k	408 nm	0.7 ns	1.8 ns	1.6 m
EJ-200	BC-408	10k	425 nm	0.9 ns	2.1 ns	~3.8 m
EJ-208	BC-412	9.2k	435 nm	1.0 ns	3.3 ns	~4.0 m

Choice of plastic material (3)

- Time precision measurement

$$\sigma_t^2 = \left(\frac{\sigma_A}{dA/dt} \right)^2 + Const$$

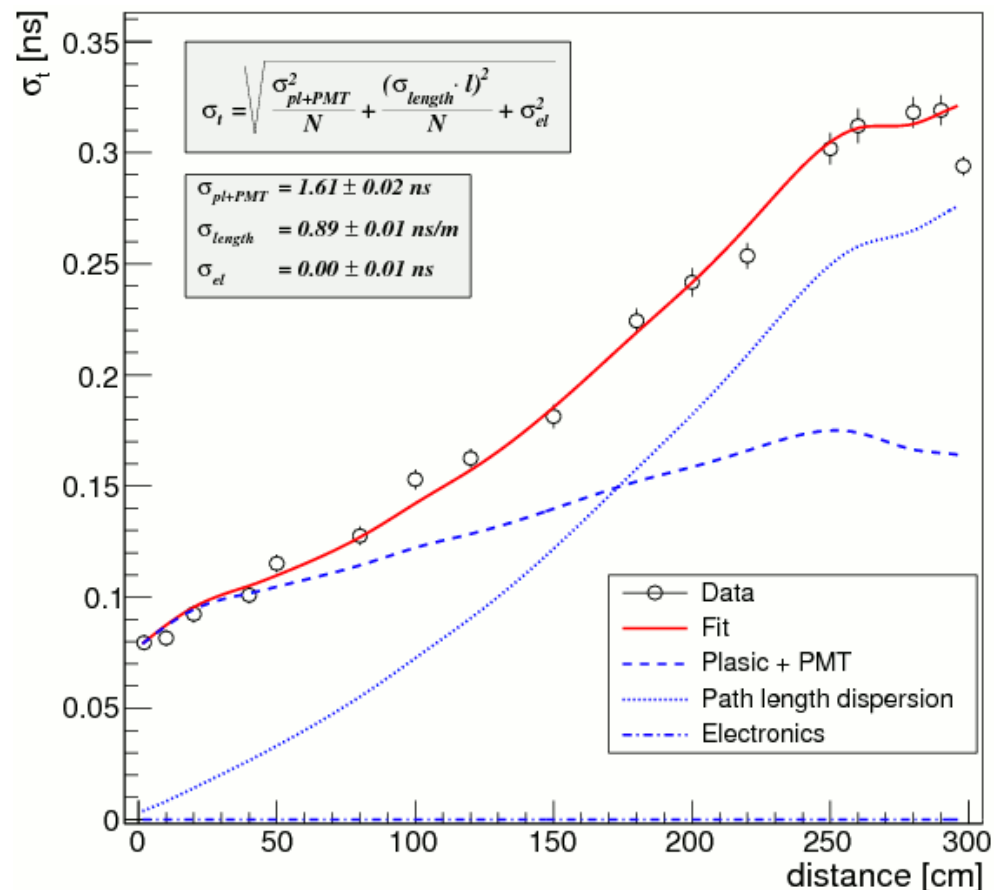

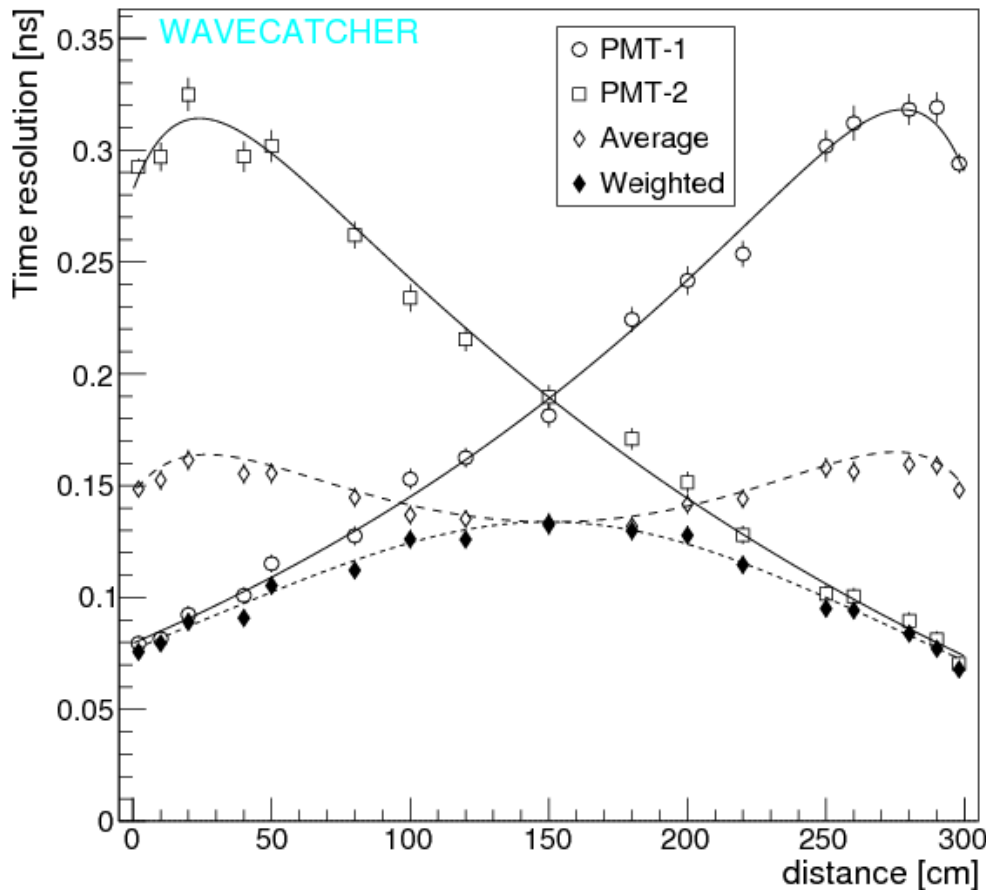

- 'Fast' plastic (steep slope) should be chosen only if there are no other contributions smearing the front edge of a signal

Time resolution of a scintillator counter

$$\sigma_t(l) = \sqrt{\frac{\sigma_{sci+PMT}^2}{N(l)} + \frac{(\sigma_{length} \cdot l)^2}{N(l)} + \sigma_{el}^2}$$

- $\sigma_{sci+PMT}$ is a decay time of the scintillator and a time jitter of PMT
- σ_{length} is a time spread of the light transmission
- σ_{el} is an uncertainty due to electronics
- N_e is the number of p.e. $N_e = N_0 e^{-l/\lambda}$

Example of counter based on cast plastic

- Data collected last summer with a **EJ-200** counter **3 m x 11 cm x 2.5 cm**
- Light collected by 2" PMTs (not SiPMs), readout by a digitizer
- Contribution from the dispersion of γ length paths σ_{length} is dominant at larger distances

Options for electronics

sensor+FE inside ND280

DAQ crate

~5 m

Array of 8 SiPMs 6x6 mm each

Preamplifier, analog sum

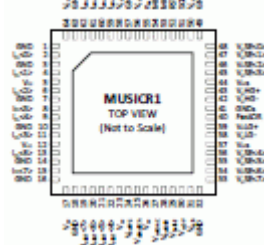

Analog signal

Digital (setup of biases)

DRS4 digitizer
dCFD

Array of 8 SiPMs 6x6 mm each

Preamplifier, analog sum,
digitization (ToT)

Digital

Concentrator
board

- Price per ASIC (MUSIC R1) is 80 EUR. Total: 1000 x 80 EUR = 80 kEUR
 - Including connectors, PCBs and so on 120 kEUR (estimate by Barcelona Uni)
- In general, UniGe can also contribute with electronics

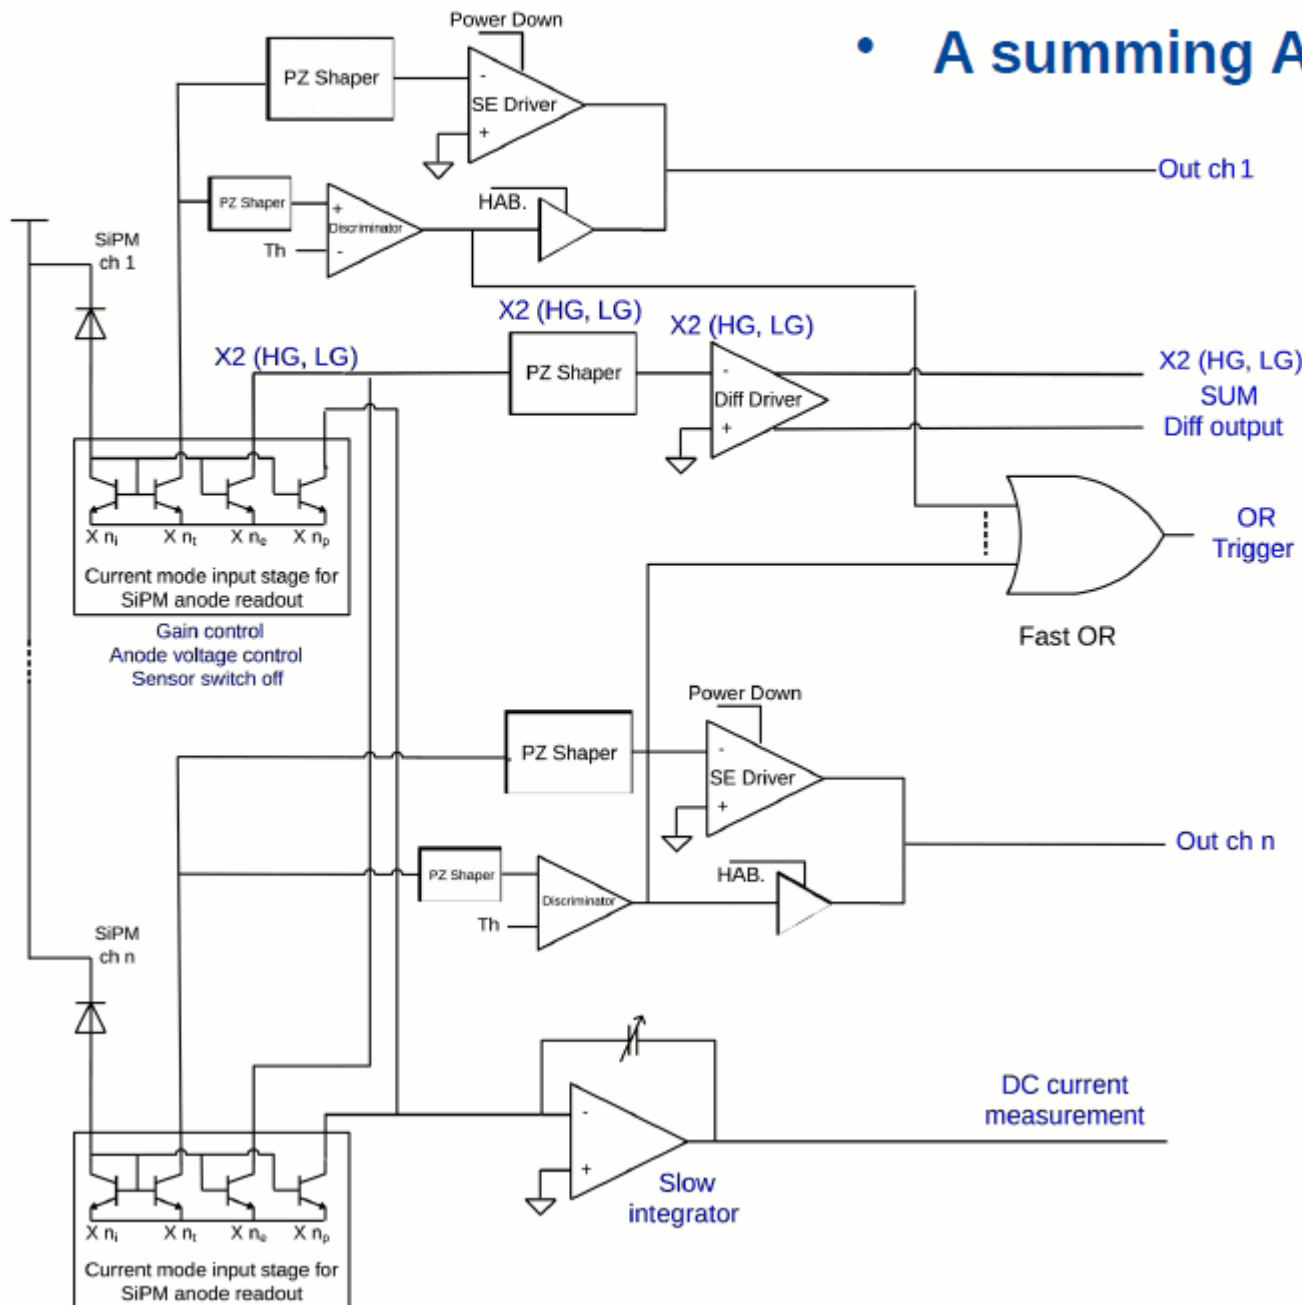

Electronics: ASIC vs discrete circuit

- Light collected by *large area SiPMs*
 - Capacitance increases with the surface of SiPM => rise time increases => time resolution degrades. Solution: readout sensors in parts, amplify and sum
- Advantage of ASIC (*MUSIC R1*) as compared to the discrete circuit
 - MUSIC (Multiple Use SiPM Integrated Circuit) developed in Uni Barcelona
 - Amplification, summation and discrimination within a single chip
 - Occupied space is much smaller
 - Power consumption is an order of magnitude lower => lower heating => less constraints for the cooling system
 - 'current buffer' is used for the input stage of MUSIC => minimum input impedance which is the best for the readout of a large capacitance

MUSIC (Multiple Use SiPM IC)

• A summing ASIC and more...

• Input

- Up to 8 pixels (6x6 mm² SiPMs)
- Possible to disable each input reducing overvoltage by 4V

• Outputs:

- High Gain SUM
 - Diff, 100 Ω , 500 MHz
- Low Gain SUM
 - Diff, 100 Ω , 500 MHz
- OR trigger
- Per channel, choose between:
 - Analog (S.E, 50 Ω , 100 MHz)
 - Digital
- “DC current”
 - Sum output
 - Per channel mux output
 - Integrator: 1 ms time constant

• Control

- Every block and channel can be disabled (power down)
- Many config parameters

Cost estimate: Plastic

- Bars with dimensions: **230 cm x 6 cm x 1 cm**
 - Scintillator EJ-200 (BC-408), attenuation length 380 cm.
 - 500 pcs: 290 EUR each
 - Total: 500 x 290 EUR = **145 kEUR**
 - Scintillator EJ-208 (BC-412), attenuation length 400 cm.
 - 500 pcs: 295 EUR each
 - Total: 500 x 295 EUR = **147.5 kEUR**
- UVT PMMA Light-Guide (optional)
 - Dimensions: 60 mm x 10 mm by 4 mm thick tapered to 56 mm x 6 mm
 - 1000 pcs: 45 EUR each
 - Total: 1000 x 45 EUR = **45 kEUR**
- Quotation by Scionix (NL) on Apr 11, 2017

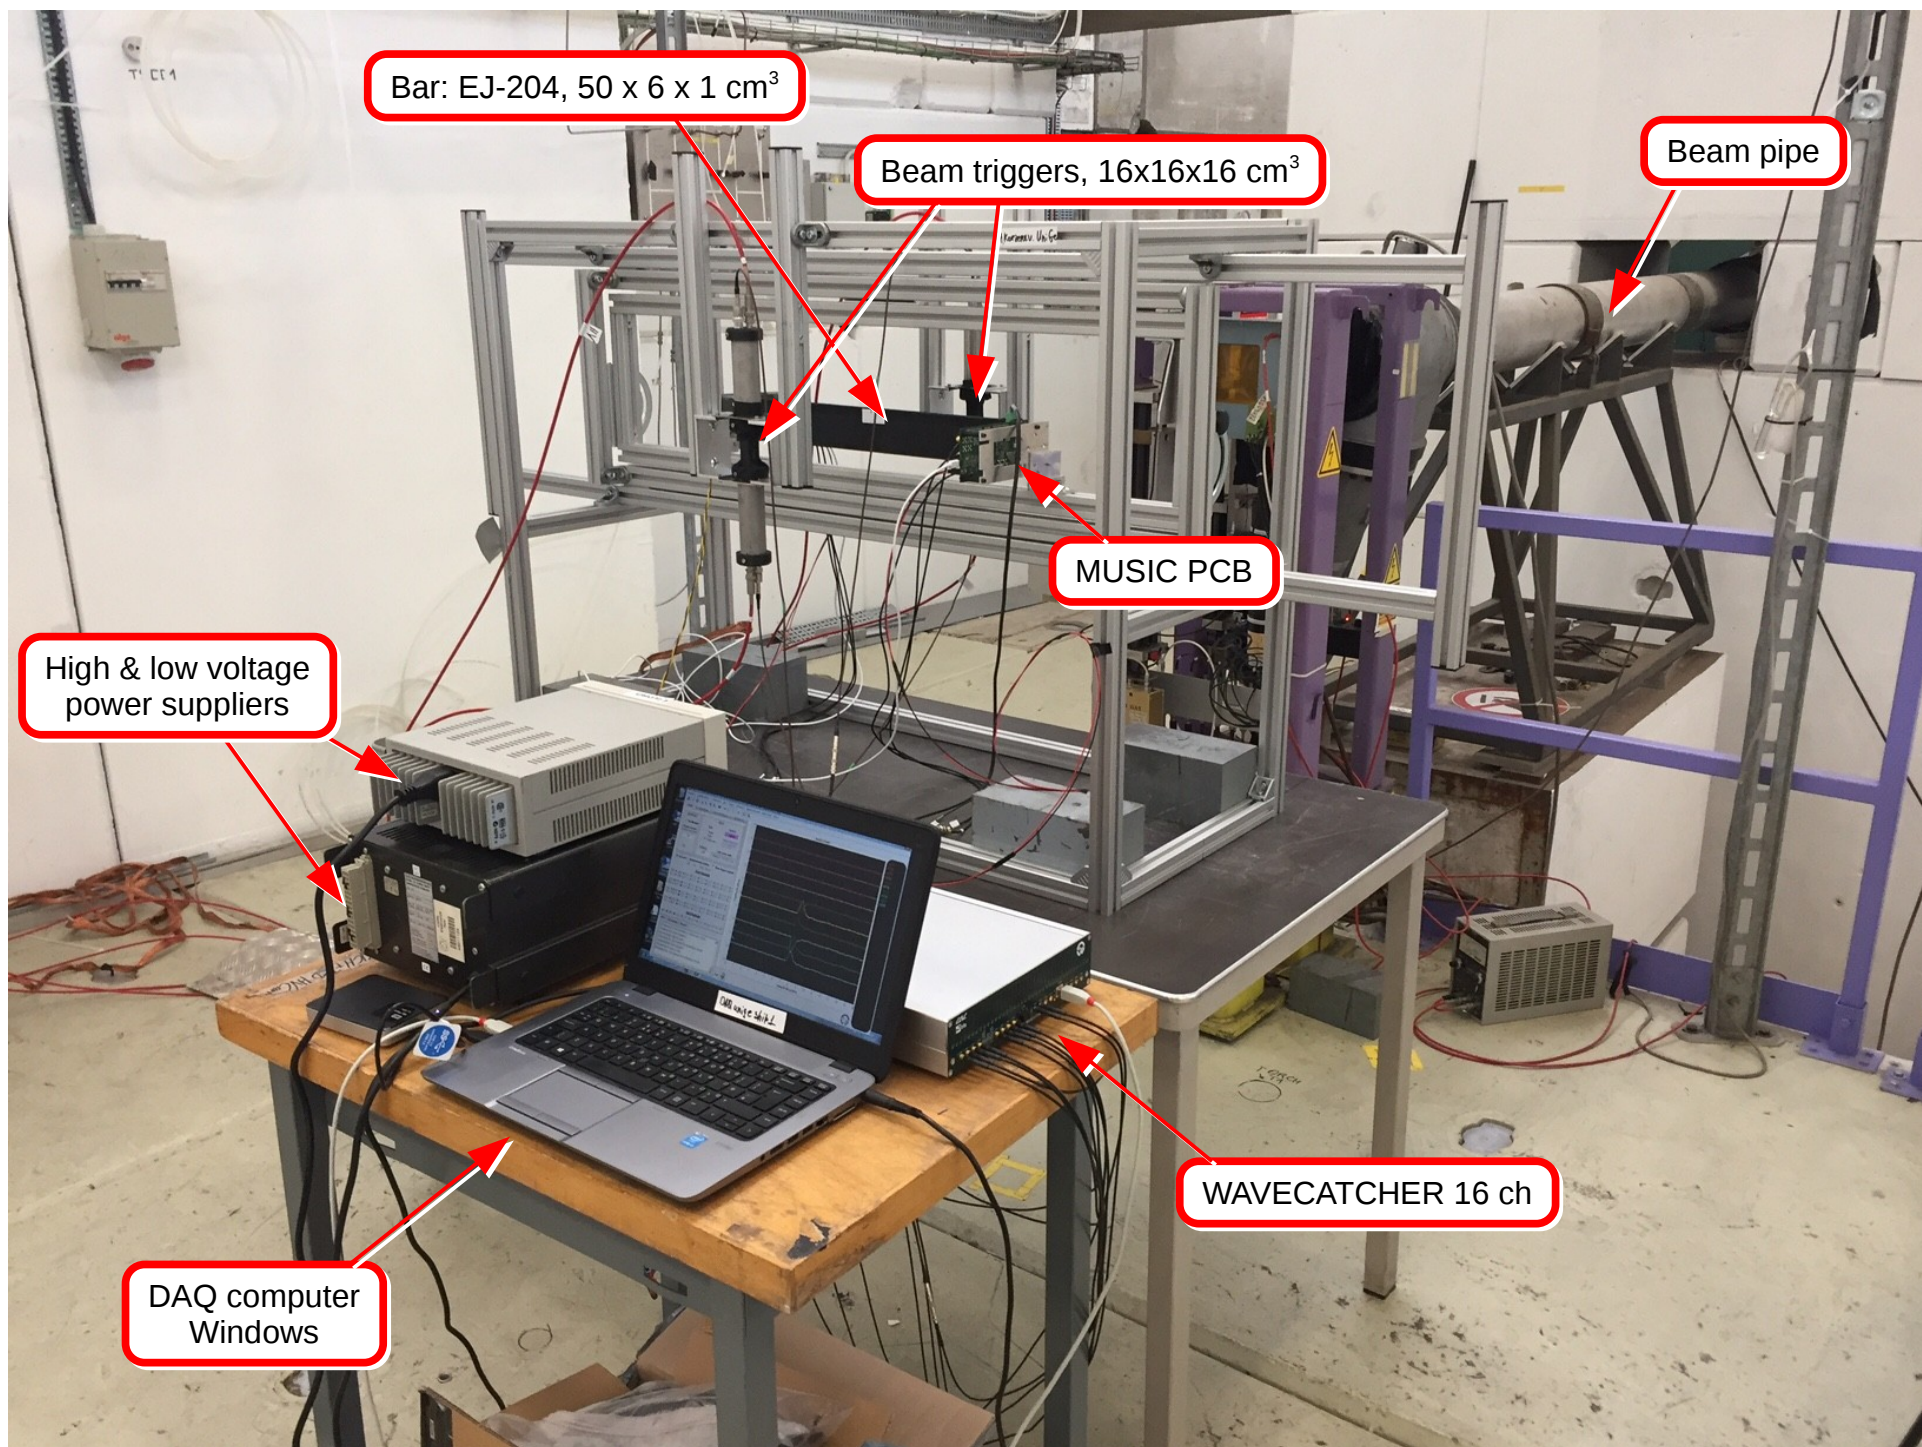

Cost estimate: SiPMs

- based on **S13360-6050PE** : 6x6mm, 50 μ m pixel, low xtalk & afterpulse, epoxy resin
- Stand-alone SMT packages
 - 8000 pcs: 2'990 JPY = 27.5 CHF/MPPC
 - Total: 8000 x 27.5 CHF = **220.0 kCHF**
 - 10 kpcs: 2'420 JPY = 22.2 CHF/MPPC
 - Pricebreak: 10-49 / 100-299 / 5k-9'999 / 10k – 49'999 pcs
- Array 6X6MM-1X8CH-MPPC
 - NRE COST SSD: 625 kJPY = 5.8 kCHF
 - 1000 pcs: 21'450 JPY = 197.1 CHF/array => 24.3 CHF/MPPC
 - Total: 1000 x 197.1 CHF = **197.1 kCHF**
 - 2000 pcs: 17'420 JPY = 160.1 CHF/array => 20.0 CHF/MPPC
 - Pricebreak: 10 (MOQ) – 49 / 1k – 1'999 / 2k -4'999 pcs
- Quotation by Hamamatsu on Apr 11, 2017
- Exchange rate assumed: 1 CHF = 108.8 JPY

Summary for the cost estimate

- ToF system based on a cast plastic (EJ-200 or EJ-208)
 - 500 bars of dimension 230 cm x 6 cm x 1 cm
 - Light collection by arrays of large area SiPMs (6x6 mm²)
 - Expected time resolution 100 – 200 ps
- Main contributors to the *overall cost* of the 'cast' version of ToF
 - Plastic: 145 kEUR
 - SiPM arrays: 197.1 kCHF
 - Electronics: 120 kEUR
 - Together: $1.1 \times (120 + 145) + 197.1 = 489$ kCHF
- If DRS is used one adds: 1000 ch x 50 CHF = 50 kCHF
- Reduction of the number of channels (Electronics+SiPMs) => square root reduction of the time resolution
- Time resolution with a long bar will be measured at the **test-beam at the end of June**
