НАУКЕ И ТЕХНОЛОШКОГ РАЗВОЈА

The soft-gluon approximation

- The soft-gluon approximation (*sg*) definition – radiated gluon carries away a small fraction of initial jet energy $x = \frac{\omega}{E} \ll 1$.

- Widely-used assumption in calculating radiative energy loss of high p_{\perp} particle traversing QGP

ASW (PRD 69:114003), BDMPS (NPB 484:265), BDMPS-Z (JETP Lett. 65:615), GLV (NPB 594:371), DGLV (NPA 733:265), HT (NPA 696:788);

M. Djordjevic, PRC, 80:064909 (2009), M. Djordjevic and U. Heinz, PRL 101:022302 (2008)

Why do we reconsider the soft-gluon approximation validity?

- **Significant** medium induced **radiative energy loss** obtained by different models → **inconsistent** with *sg* approximation?
- Sg approximation also used in our **Dynamical energy loss formalism**. (M. Djordjevic and M. D. PLB 734:286 (2014))
- Our dynamical energy loss model reported robust agreement with extensive set of experimental R_{AA} data → implies model **reliability**.

(M. Djordjevic and M. D., PLB 734:286 (2014); PRC 90:034910 (2014),

M. Djordjevic, M. D. and B. Blagojevic, PLB 737:298 (2014); M. Djordjevic, PRL 112:042302 (2014), M. Djordjevic and M. D., PRC 92:024918 (2015))

- It **breaks-down** for:
 - $5 < p_{\perp} < 10$ GeV
 - Primarily for gluon energy loss

Relaxing the soft-gluon approximation

Comparison of numerical predictions between *bsg* and *sg*

Comparison of numerical predictions between *bsg* and *sg*

1. Fractional radiative energy loss $\Delta E^{(1)} / E$ and number of radiated gluons $N_g^{(1)}$

Comparison of numerical predictions between *bsg* and *sg*

1. Fractional radiative energy loss $\Delta E^{(1)} / E$ and number of radiated gluons $N_g^{(1)}$
2. Fractional differential radiative energy loss $\frac{1}{E} \frac{dE^{(1)}}{dx}$ and single gluon radiation spectrum $\frac{dN_g^{(1)}}{dx}$

Comparison of numerical predictions between *bsg* and *sg*

1. Fractional radiative energy loss $\Delta E^{(1)} / E$ and number of radiated gluons $N_g^{(1)}$
2. Fractional differential radiative energy loss $\frac{1}{E} \frac{dE^{(1)}}{dx}$ and single gluon radiation spectrum $\frac{dN_g^{(1)}}{dx}$
3. Angular averaged nuclear modification factor R_{AA}

Effect of relaxing sga on integrated variables

Finite x slightly **increases** fractional radiative energy loss up to $\approx 3\%$ compared to sg .

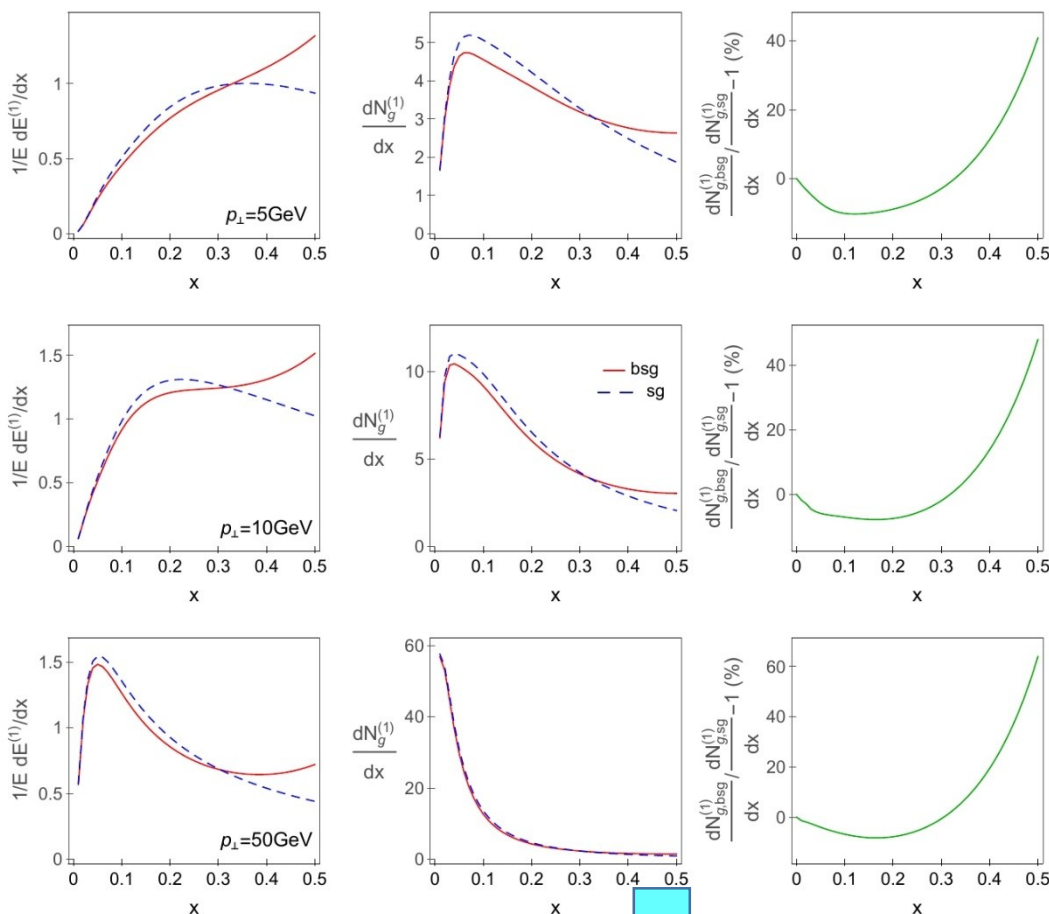

Finite x slightly **decreases** number of radiated gluons $\approx -2\%$ compared to sg .

≈ 10 GeV

Effect on $\Delta E^{(1)}/E$ and $N_g^{(1)}$ is **small** and of an **opposite sign!**

Effect of relaxing *sga* on differential variables

Nearly the same effect
on $dN_g^{(1)}/dx$ for
 $0 < x \leq 0.4$
independently of p_{\perp} .

The effect on $dE^{(1)}/dx$ and $dN_g^{(1)}/dx$ is **small** for $x \leq 0.4$, while **enhances** to a notable value with increasing x above the “cross-over” point $x \approx 0.3$.

Computational formalism for bare gluon suppression

1. Initial gluon p_{\perp} spectrum
2. Radiative energy loss

- **Gluon production**

(Z.B. Kang, I. Vitev and H. Xing, PLB 718:482 (2012); R. Sharma, I. Vitev and B.W. Zhang, PRC 80:054902 (2009))

- **Radiative energy loss in finite size static QGP medium *beyond soft gluon approximation***

(B. Blagojevic, M. Djordjevic and M. Djordjevic, arXiv:nucl-th/1804.07593 (2018) PRC under review)

- **Multi-gluon fluctuations**

(M. Gyulassy, P. Levai and I. Vitev, PLB 538:282 (2002))

- **Path-length fluctuations**

(S. Wicks, W. Horowitz, M. Djordjevic and M. Gyulassy, NPA 784:426 (2007); A. Dainese, EPJ C 33:495 (2004))

Effect of relaxing sga on R_{AA}

Even smaller effect
on R_{AA}
compared to all
previous variables!

1. Why is R_{AA} barely affected by this relaxation?
2. How the large differential variables discrepancies between **bsg** and **sg** cases at $x > 0.4$ do not influence R_{AA} ?

Explanation of negligible effect on R_{AA} (1)

Both $\Delta E^{(1)}/E$ and $N_g^{(1)}$ non-trivially affect R_{AA} .

Interplay of the **opposite effects** on $\Delta E^{(1)}/E$ and $N_g^{(1)}$ is responsible for negligible effect on R_{AA} .

Explanation of negligible effect on R_{AA} (2)

Due to sharply decreasing initial gluon p_{\perp} distribution, the $x \leq 0.4$ is the most relevant region for distinguishing bsg from $sg R_{AA}$.

In this region bsg and $sg \frac{dN_g^{(1)}}{dx}$ and $\frac{1}{E} \frac{dE^{(1)}}{dx}$ are within 10%.

Intuitively explains insignificant finite x effect on R_{AA} .

Conclusions and outlook

Different theoretical models reported considerable radiative energy loss questioning the validity of the soft-gluon approximation.

We relaxed the approximation for high p_{\perp} **gluons**, which are most affected by it, within **DGLV** formalism, and although analytical results differ to a great extent in **bsg** and **sg** cases, surprisingly the numerical predictions were nearly indistinguishable.

Consequently, this relaxation should have even smaller impact on high p_{\perp} quarks.

This implies that soft gluon approximation is reliable within DGLV formalism.

We expect that the soft-gluon approximation will remain well-founded within **the dynamical energy loss formalism**, which needs to be rigorously tested in the future.

Thank you for your attention!

Backup

Generalization on dynamical medium

- Implicitly suggested by robust agreement of our R_{AA} predictions with experimental data
- Only $f(\mathbf{k}, \mathbf{q}, x)$ depends on x
- $f(\mathbf{k}, \mathbf{q}, x)$ in soft-gluon approximation is the same in static and in dynamical case

We expect dynamical $f(\mathbf{k}, \mathbf{q}, x)$ to be modified in the similar manner to the static (DGLV) case.

Calculations beyond soft-gluon approximation

Calculations beyond soft-gluon approximation

Longitudinal initial gluon direction:

No interactions with QGP medium (M_0)	One interaction with QGP medium (M_1)	Two interactions with QGP medium (M_2)
$p + k = [E^+, E^-, \mathbf{0}]$	$p + k - q_1 = [E^+ - q_{1z}, E^- + q_{1z}, \mathbf{0}]$	$p + k - q_1 - q_2 = [E^+ - q_{1z} - q_{2z}, E^- + q_{1z} + q_{2z}, \mathbf{0}]$

$$k = [xE^+, \frac{\mathbf{k}^2 + m_g^2}{xE^+}, \mathbf{k}] \quad p = [(1-x)E^+, \frac{\mathbf{p}^2 + m_g^2}{(1-x)E^+}, \mathbf{p}]$$

Transverse momenta:

arXiv:nucl-th\1804.07593 (PRC under review)**

$$\frac{d\sigma_{el}}{d^2\mathbf{q}_1} = \frac{C_2(G)C_2(T)}{d_G} \frac{|v(0, \mathbf{q}_1)|^2}{(2\pi)^2}$$

$$\text{Opacity} = L/\lambda = N\sigma_{el}/A_{\perp}$$

**Small transverse
momentum transfer elastic
cross section (GW)**

(M. Gyulassy and X.N.
Wang, NPB 420, 583 (1994))

Two limits of longitudinal distance distribution

Longitudinal distance between gluon production site and target rescattering site:

Exponential distribution

$$\frac{2}{L} e^{-\frac{2\Delta z}{L}}$$

Uniform distribution

$$R_{AA}(p_{\perp}) = \frac{dN_{AA}/dp_{\perp}}{N_{bin}dN_{pp}/dp_{\perp}}$$

D. Molnar and D. Sun, NPA 932:140;
NPA 910:486, T. Renk, PRC 85:044903.

$$\frac{E_f d^3\sigma(g)}{dp_f^3} = \frac{E_i d^3\sigma(g)}{dp_i^3} \otimes P(E_i \rightarrow E_f)$$

pQCD convolution
