

HARD PROBES — 2018 —

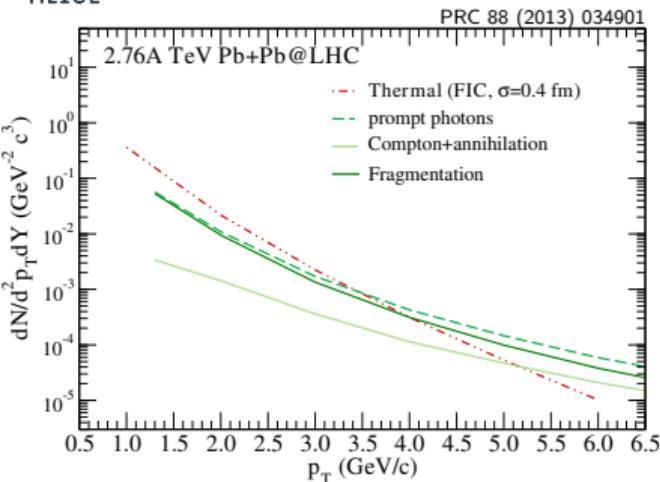

International Conference on Hard and Electromagnetic Probes of High-Energy Nuclear Collisions
30 September 2018 to 5 October 2018 ● Aix-Les-Bains ● France

Direct Photon Production and Flow at Low Transverse Momenta in pp, p-Pb and Pb-Pb Collisions

Nicolas Schmidt (ORNL/IKF)
for the ALICE Collaboration

γ created during entire space time evolution after collision, leave medium unaffected
 \Rightarrow ideal probe

pp, p-Pb & Pb-Pb collisions

Prompt Photons

- Calculable within NLO pQCD
- Test of binary scaling in p-Pb & Pb-Pb at high p_T
- Not affected by collective expansion

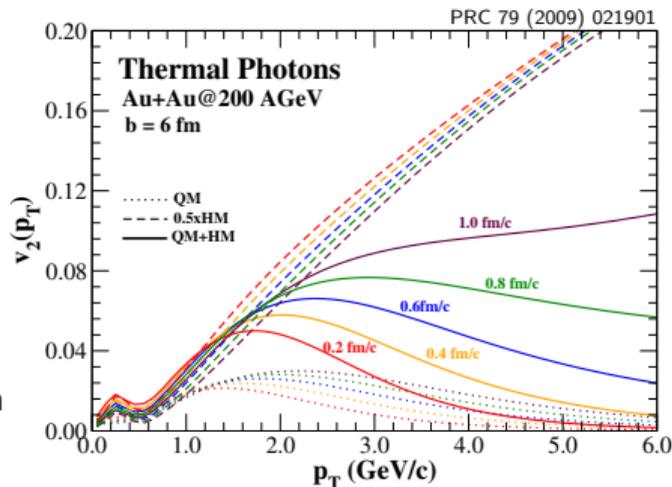

Additional sources Pb-Pb (p-Pb, pp?) collisions

Thermal Photons

- Scattering of thermalized particles
- Exponentially decreasing, dominant at low p_T
- Susceptible to flow evolution

Jet-Medium Interactions

- Scattering of hard partons with thermalized partons
- In-medium (photon) bremsstrahlung emitted by quarks
- Possibly affected by flow evolution

Subtraction Method:

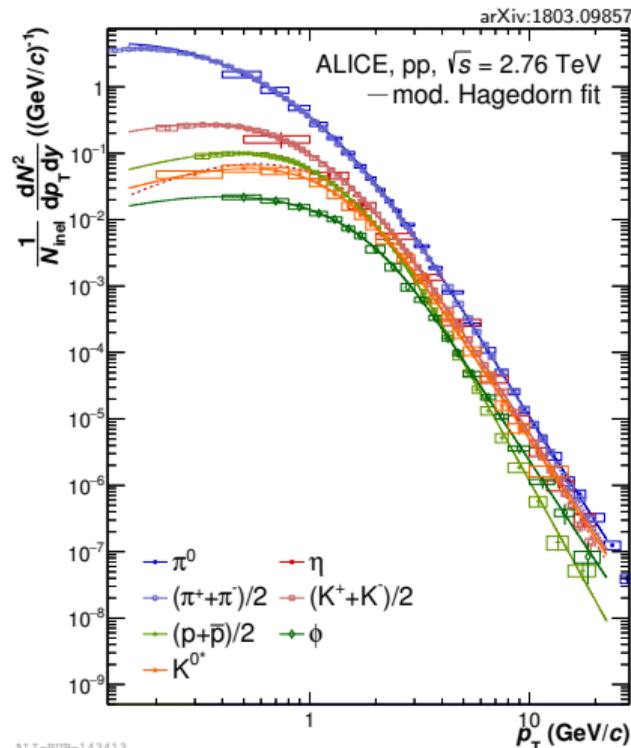

$$\begin{aligned}\gamma_{\text{direct}} &= \gamma_{\text{inc}} - \gamma_{\text{decay}} = \left(1 - \frac{\gamma_{\text{decay}}}{\gamma_{\text{inc}}}\right) \cdot \gamma_{\text{inc}} \\ &= \left(1 - \frac{1}{R_\gamma}\right) \cdot \gamma_{\text{inc}}\end{aligned}$$

- **Inclusive photons:** measure all photons that are produced
- **Decay photons:** calculated by decay simulation from measured or m_T scaled particle spectra (PRC 96 064907)

Double Ratio:

$$R_\gamma = \frac{\gamma_{\text{inc}}}{\pi^0} / \frac{\gamma_{\text{decay}}}{\pi^0_{\text{param}}} \quad \text{if } R_\gamma > 1 \rightarrow \text{direct photon signal}$$

Numerator: Measured inclusive γ spectrum per π^0 **Denominator:** Estimated sum of all decay photons per π^0
 → advantage of ratio method: cancellation of some large uncertainties

Subtraction Method:

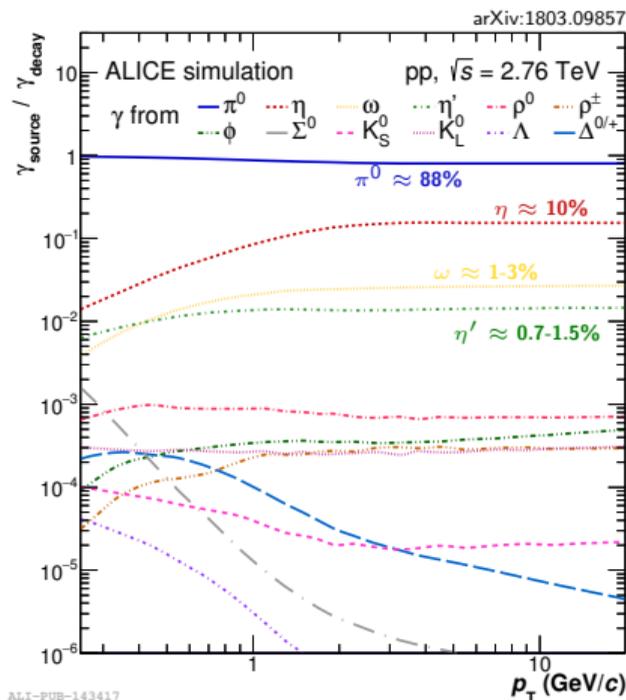

$$\begin{aligned}\gamma_{\text{direct}} &= \gamma_{\text{inc}} - \gamma_{\text{decay}} = \left(1 - \frac{\gamma_{\text{decay}}}{\gamma_{\text{inc}}}\right) \cdot \gamma_{\text{inc}} \\ &= \left(1 - \frac{1}{R_\gamma}\right) \cdot \gamma_{\text{inc}}\end{aligned}$$

PHOS calorimeter

- PbWO₄ crystals
- $|\eta| < 0.12$, $260^\circ < \varphi < 320^\circ$

PHOS

arXiv:1803.09857

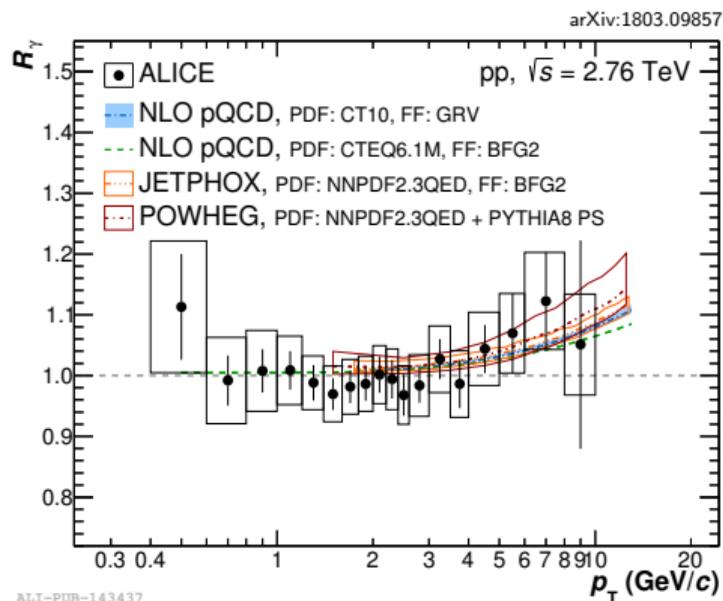

- Dominating systematic uncertainties:
 - p_T -independent material unc. of 4.5% PCM, 2.8% EMC
- p_T reach:
 - $0.4 < p_T < 10$ GeV/c in pp, $\sqrt{s} = 2.76$ TeV
 - $0.3 < p_T < 14$ GeV/c in pp, $\sqrt{s} = 8$ TeV

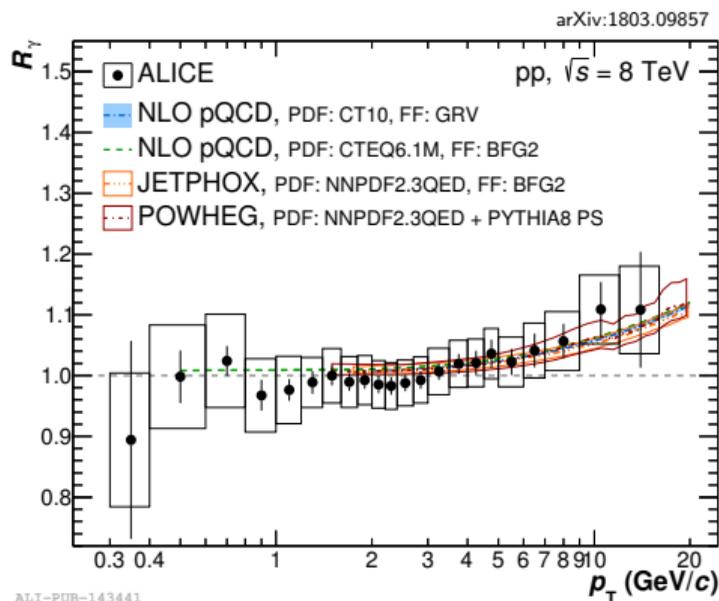

arXiv:1803.09857

- Combination of 3 reconstruction techniques via BLUE method
- Within uncertainties no significant excess at low p_T observed
- supports interpretation in Pb–Pb as medium effects
- About 1 – 2 σ deviation from unity for $p_T > 7$ GeV/c

Direct Photons in Pb-Pb

- Direct photon excess measured with combined PCM + PHOS in 3 centrality classes with 2010 Pb-Pb data
- R_γ excess at high p_T for all centralities
- γ^{dec} suppressed by $\approx R_{\text{AA}}^{\pi^0}$
→ enhanced S/B in central collisions
- **Low $p_T \sim 15\%$ excess in 0 – 20% and $\sim 9\%$ in 20 – 40%**
- In agreement with NLO pQCD, JETPHOX above 5 GeV/c
- No low p_T excess seen in pp collisions at same center-of-mass energy
- Scaled pp spectrum & upper limits fully consistent with Pb-Pb results

Direct Photons in Pb-Pb

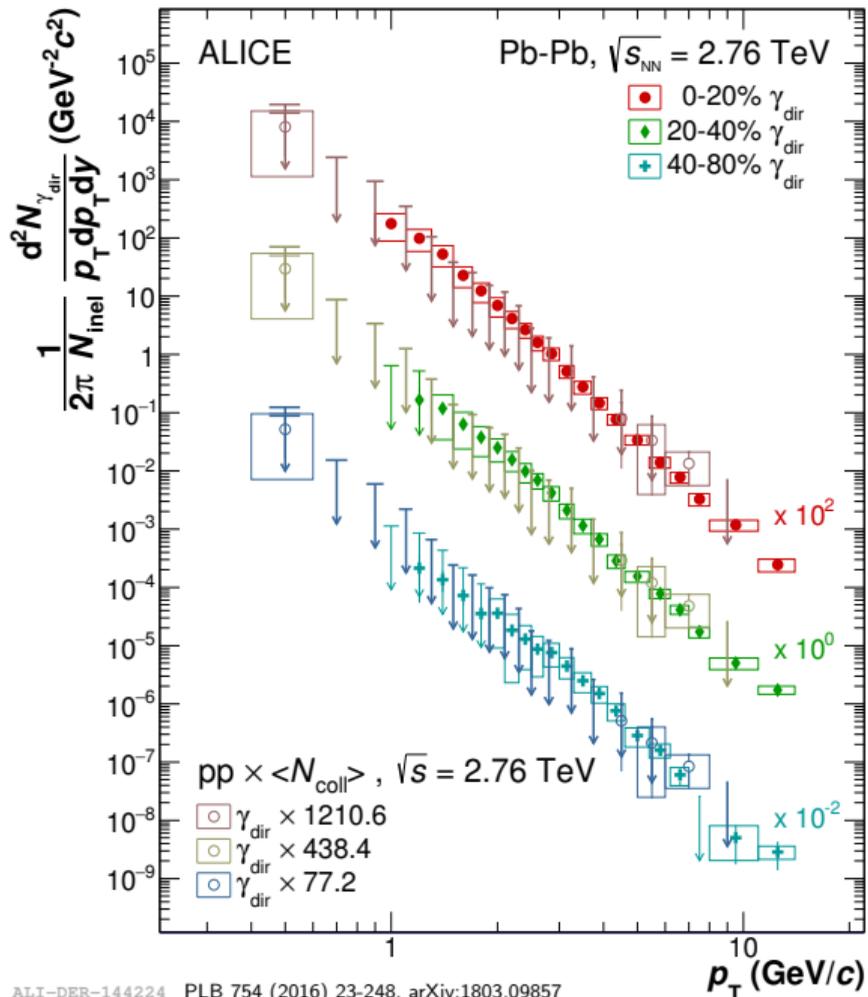

- Direct photon excess measured with combined PCM + PHOS in 3 centrality classes with 2010 Pb-Pb data
- R_γ excess at high p_T for all centralities
- γ^{dec} suppressed by $\approx R_{\text{AA}}^{\pi^0}$
 \rightarrow enhanced S/B in central collisions
- **Low $p_T \sim 15\%$ excess in 0 – 20% and $\sim 9\%$ in 20 – 40%**
- In agreement with NLO pQCD, JETPHOX above 5 GeV/c
- No low p_T excess seen in pp collisions at same center-of-mass energy

Decay photon v_2 :

- KE_T scaling: v_2 of mesons scales with KE_T

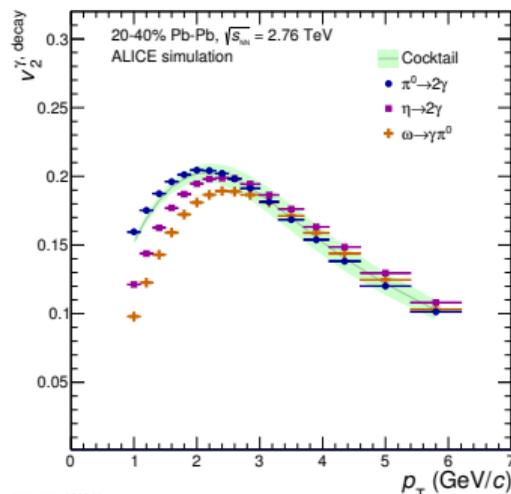

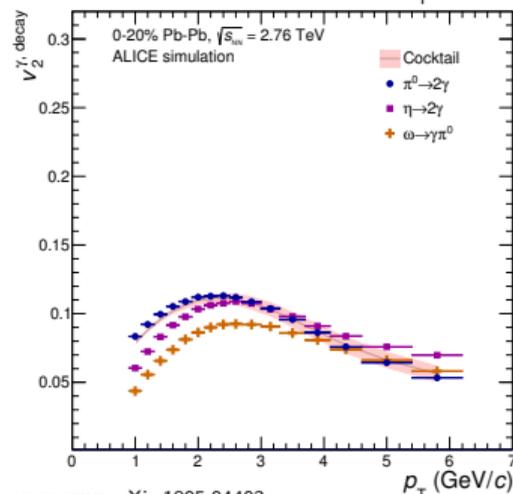

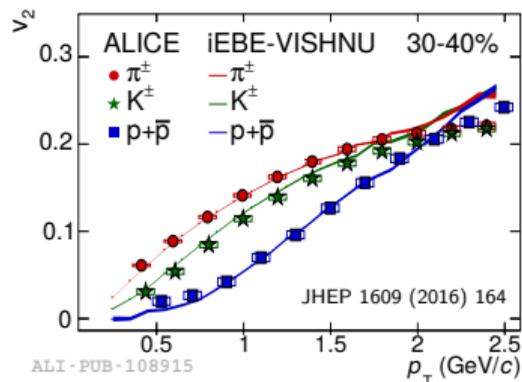

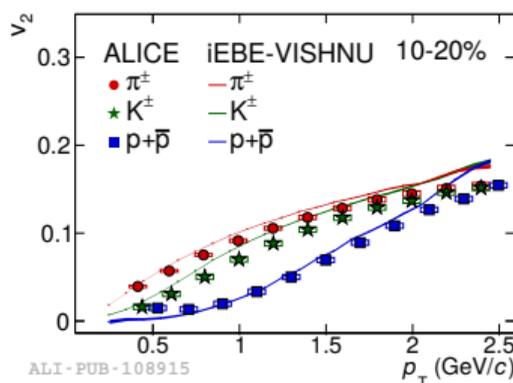

$$KE_T = m_T - m = \sqrt{p_T^2 + m^2} - m$$

$$\Rightarrow v_2^{\pi^0} \approx v_2^{\pi^\pm} \quad (m^{\pi^0} \approx m^{\pi^\pm})$$

→ v_2 of various mesons (X) calculated via KE_T (quark number) scaling from $v_2^{K^\pm}$

$$v_2^X(p_T^X) = v_2^{K^\pm} \left(\sqrt{(KE_T^X + m^{K^\pm})^2 - (m^{K^\pm})^2} \right)$$

- Decay photon v_2 from different mesons obtained from cocktail calculation**

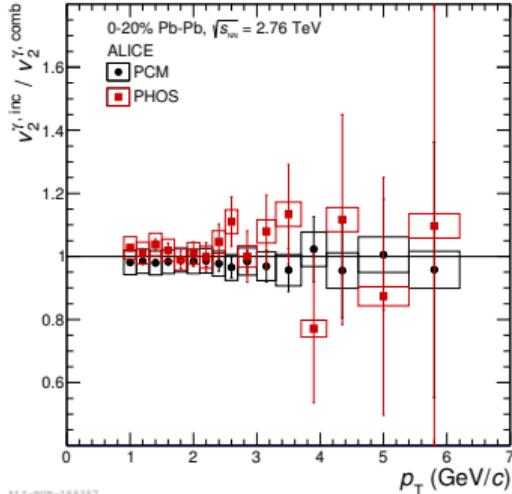

v_2^γ Inclusive and Decay

● $v_2^{\gamma,inc}$ measured with PCM & PHOS

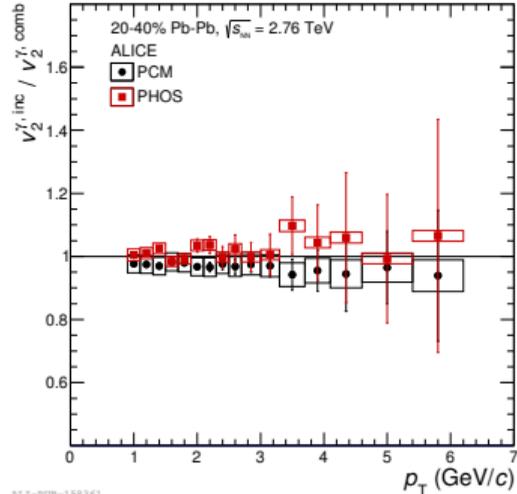

→ Corrected for BG flow from impurities
[JPG 44 (2917) no. 2, 025106]

→ Assumed to be independent

→ Consistent, p -values of
0.93 (0-20%) & 0.43 (20-40%)

ALI-PUB-158357

ALI-PUB-158361

v_2^γ Inclusive and Decay

- $v_2^{\gamma,inc}$ measured with PCM & PHOS

→ Corrected for BG flow from impurities
[JPG 44 (2917) no. 2, 025106]

→ Assumed to be independent

→ Consistent, p -values of
0.93 (0-20%) & 0.43 (20-40%)

- $p_T < 3 \text{ GeV}/c$: $v_2^{\gamma,inc} = v_2^{\gamma,dec}$

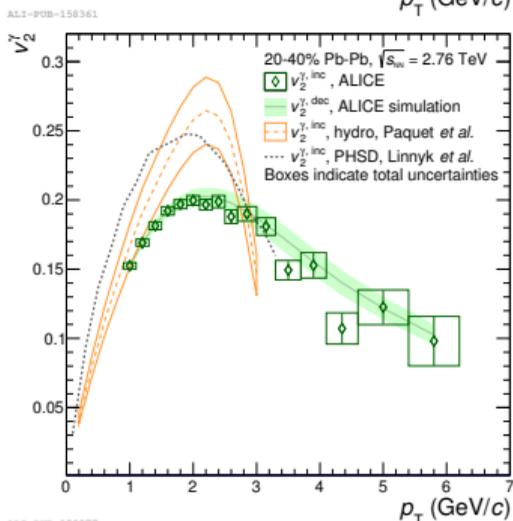

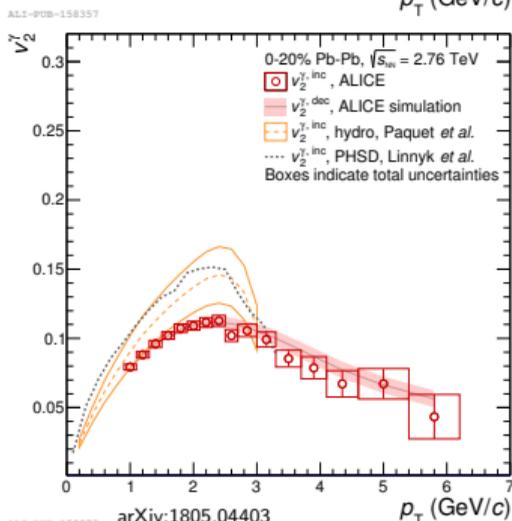

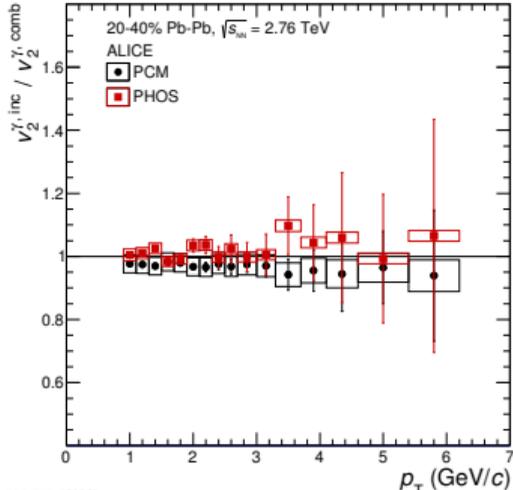

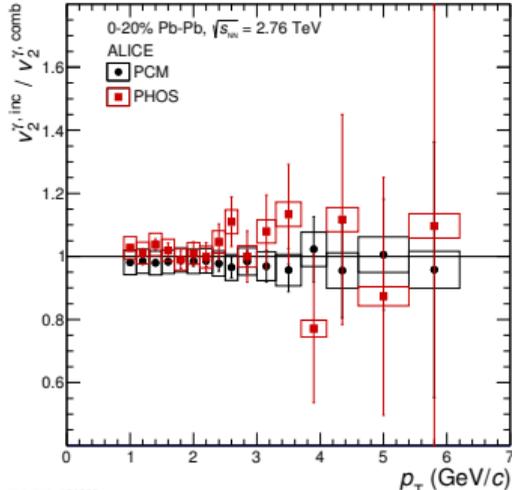

⇒ Either no contribution of γ_{dir}
or $v_2^{\gamma,inc} \approx v_2^{\gamma,dec}$

→ Theory $\sim 30 - 40\%$ too high

- $p_T > 3 \text{ GeV}/c$: $v_2^{\gamma,inc} < v_2^{\gamma,dec}$

→ Direct photon v_2 contribution with
 $v_2^{direct} < v_2^{decay}$

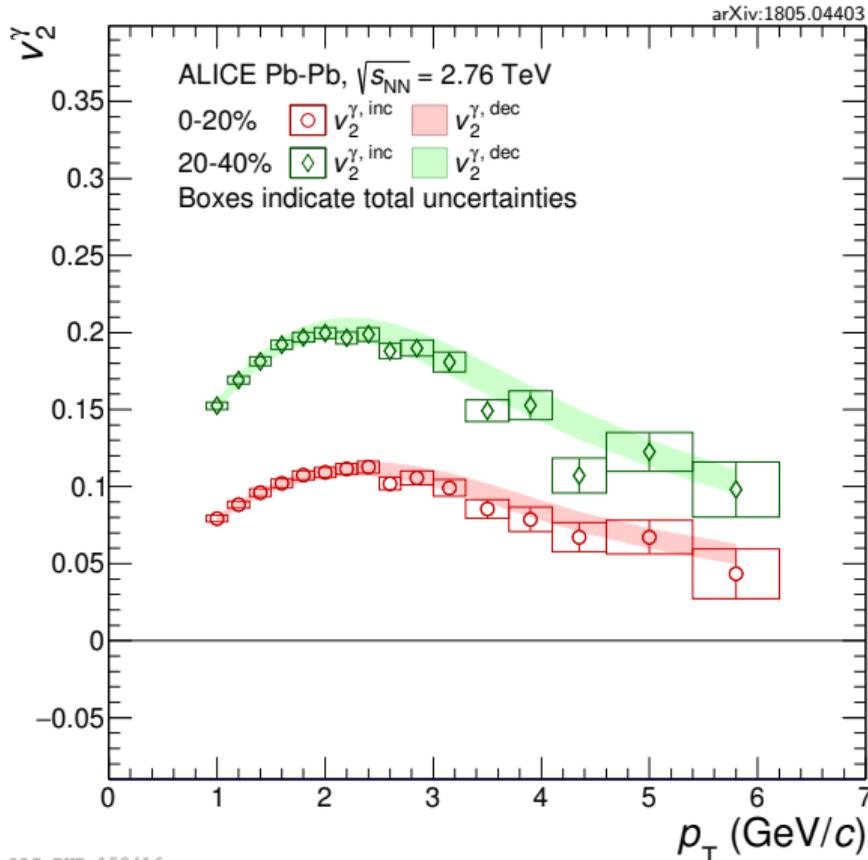

→ Mainly prompt photons

Direct photon v_2 :

$$v_2^{\gamma, \text{dir}} = \frac{R_\gamma \cdot v_2^{\gamma, \text{inc}} - v_2^{\gamma, \text{dec}}}{R_\gamma - 1}$$

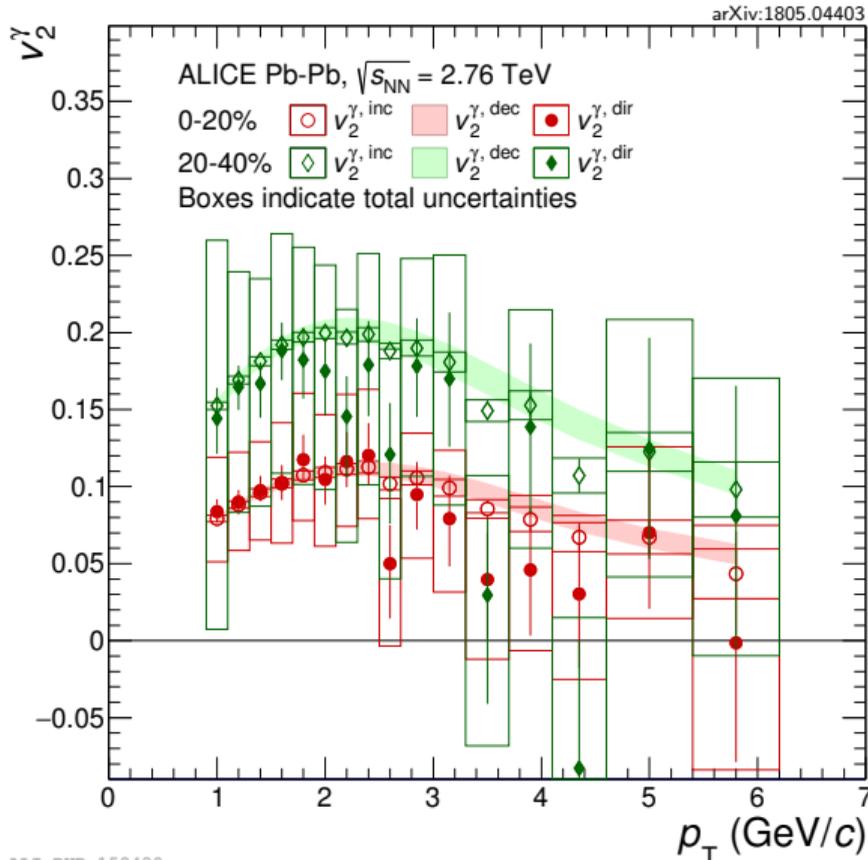

- Measured R_γ often less than $2\sigma_{\text{sys}}$ deviation from 1
- ⇒ Central value & unc. calculated using MC simulation following Bayesian approach with probability distributions of true (t) values of $R_\gamma^t(p_T)$, $v_2^{\gamma, \text{dec}, t}(p_T)$, $v_2^{\gamma, \text{inc}, t}(p_T)$ assuming R_γ^t can't be smaller than unity & partially p_T -correlated unc.
- Large direct photon v_2 for $p_T < 3$ GeV/c measured
- Magnitude of $v_2^{\gamma, \text{dir}}$ comparable to hadrons
- Result points to late production times of direct photons after flow is established

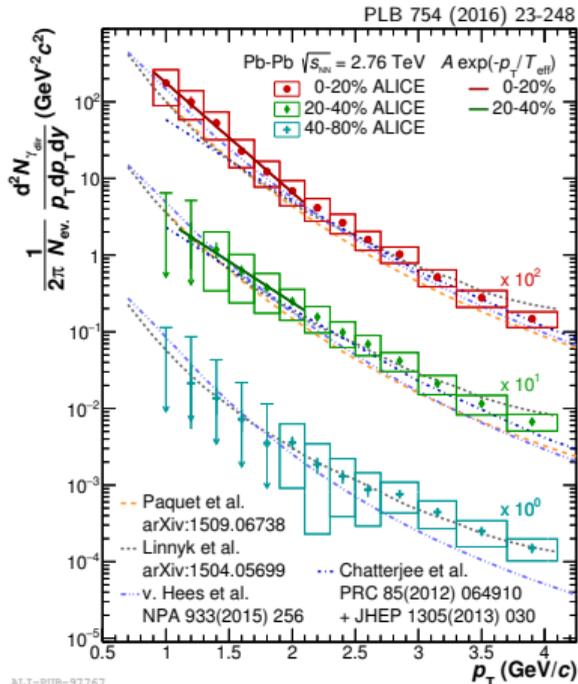

Direct photon v_2 :

$$v_2^{\gamma, \text{dir}} = \frac{R_\gamma \cdot v_2^{\gamma, \text{inc}} - v_2^{\gamma, \text{dec}}}{R_\gamma - 1}$$

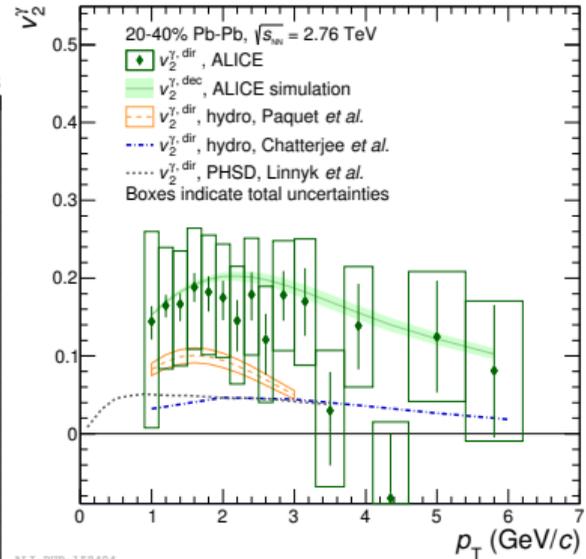

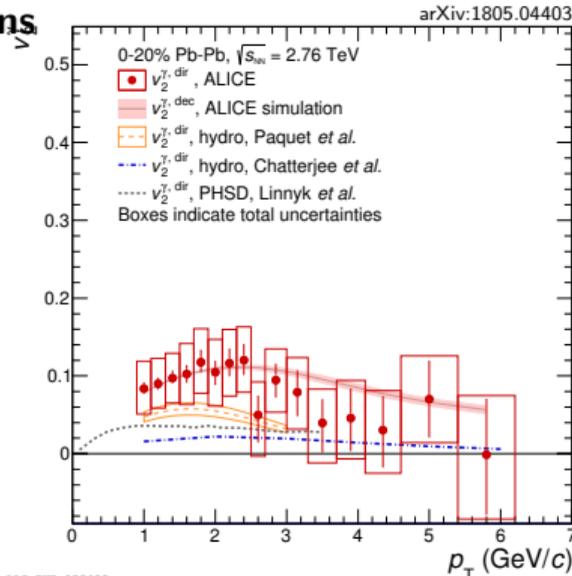

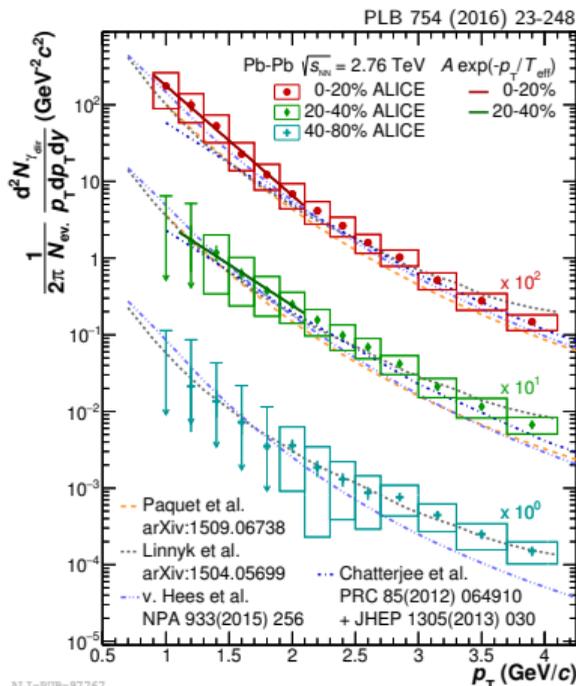

- Measured R_γ often less than $2\sigma_{\text{sys}}$ deviation from 1
- ⇒ Central value & unc. calculated using MC simulation following Bayesian approach with probability distributions of true (t) values of $R_\gamma^t(p_T)$, $v_2^{\gamma, \text{dec}, t}(p_T)$, $v_2^{\gamma, \text{inc}, t}(p_T)$ assuming R_γ^t can't be smaller than unity & partially p_T -correlated unc.
- Large direct photon v_2 for $p_T < 3 \text{ GeV}/c$ measured**
- Magnitude of $v_2^{\gamma, \text{dir}}$ **comparable to hadrons**
- Result points to **late production** times of direct photons after flow is established

- Central points for direct photon yield and $v_2^{\gamma,dir}$ **underestimated by most theoretical calculations** by factors of 2-5

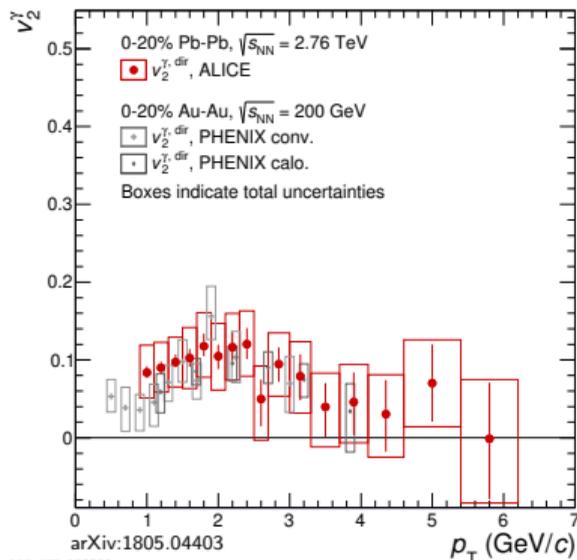

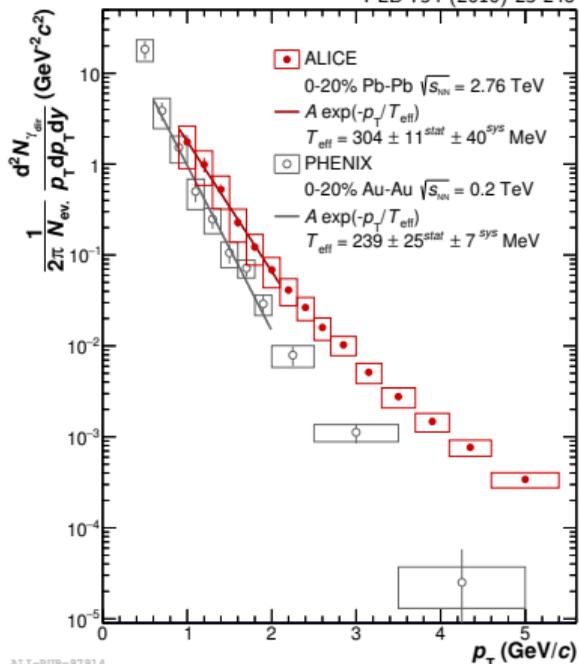

- Central points for direct photon yield and $v_2^{\gamma,dir}$ **underestimated** by most theoretical calculations by factors of 2-5

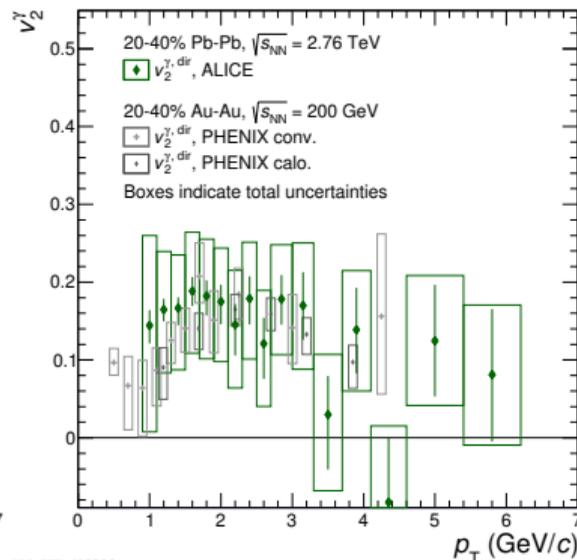

- $v_2^{\gamma,dir}$ compatible with $v_2^{\gamma,dir} = 0$ within 1.4(1.0) σ in p_T range ($0.9 < p_T < 2.1$ GeV/c) in 0-20%(20-40%) centrality
- No deviation beyond 2 σ from theory observed for spectra or v_2
- Similar observations for all theoretical calculations despite very different setups

- Photon yield increased by factor ≈ 2 for $p_T < 3$ GeV/c
- Larger T_{eff} for direct photons at LHC energies

PLB 754 (2016) 23-248

arXiv:1805.04403

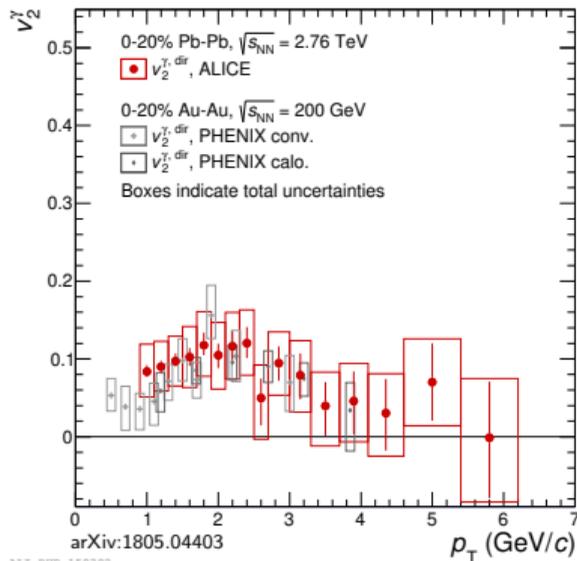

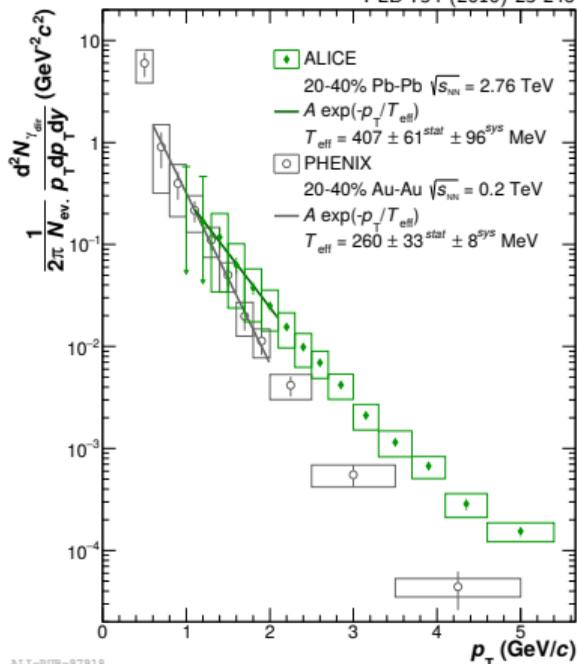

ALI-PUB-158396

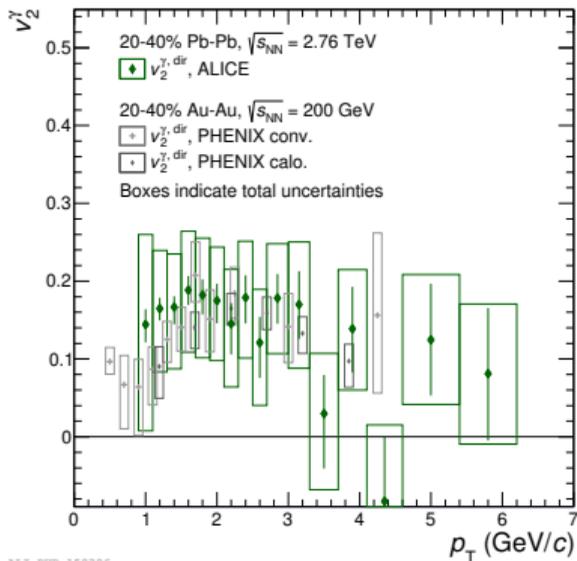

- v_2 compatible with v_2 measured at $\sqrt{s_{NN}} = 0.2$ TeV
- **Similar scaling behavior of direct photon v_2 as for charged hadrons**
- Higher significance for PHENIX result due to larger signal in R_γ at Au-Au $\sqrt{s_{NN}} = 0.2$ TeV

- Photon yield increased by factor ≈ 2 for $p_T < 3$ GeV/c
- Larger T_{eff} for direct photons at LHC energies

PLB 754 (2016) 23-248

ALI-PUB-158392

ALI-PUB-158396

- v_2 compatible with v_2 measured at $\sqrt{s_{NN}} = 0.2$ TeV
- **Similar scaling behavior of direct photon v_2 as for charged hadrons**
- Higher significance for PHENIX result due to larger signal in R_{γ} at Au-Au $\sqrt{s_{NN}} = 0.2$ TeV

γ_{dir} production in pp & p-Pb collisions:

- First direct photon measurements at the LHC for pp and p-Pb collisions at low transverse momenta
→ New measurement of multiplicity dependence of γ_{dir} in p-Pb **NEW!**
- No significant direct photon excess observed in thermal photon region ($p_{\text{T}} < 3 \text{ GeV}/c$)
- Consistent with NLO pQCD calculations at higher p_{T}

γ_{dir} production and flow in Pb-Pb Collisions:

- Direct photon excess for $p_{\text{T}} < 3 \text{ GeV}/c$ observed with 2.6σ for 0-20% and 1.5σ in 20-40% consistent with theory expectations
- Spectrum consistent with NLO pQCD calculations at high p_{T}
- First direct photon flow measurement at the LHC with 2 independent reconstruction techniques in 0-20% and 20-40% Pb-Pb collisions
- Direct photon v_2 in 0-20% & 20-40% of similar size as the charged hadron flow and inclusive photon flow, but compatible with 0 within 1.4σ or 1.0σ in p_{T} range ($0.9 < p_{\text{T}} < 2.1 \text{ GeV}/c$)
