

# **Review of the MQW and MBW lifetime taking into account results from the reading of the dosimeters collecting data in the 2016 RUN**

Dosimeter (installation, reading, analysis): P. Schwarz, I. Brunner, I. Sancho Fernandez

FLUKA analysis: C. Bahamonde, F. Cerutti, E. Skordis, A. Lechner

R2E scaling: R. Garcia Alia

Shielding functional design C. Bahamonde, A. Lechner

Estimation of the integrated intensity for next year: A. Apollonio, R. De Maria

Magnet team: P. Fessia, N. Mariani [presently ITER] I. Sanchez Fernandez, P. Schwarz

## **PRELIMINARY RESULTS**

# Summary

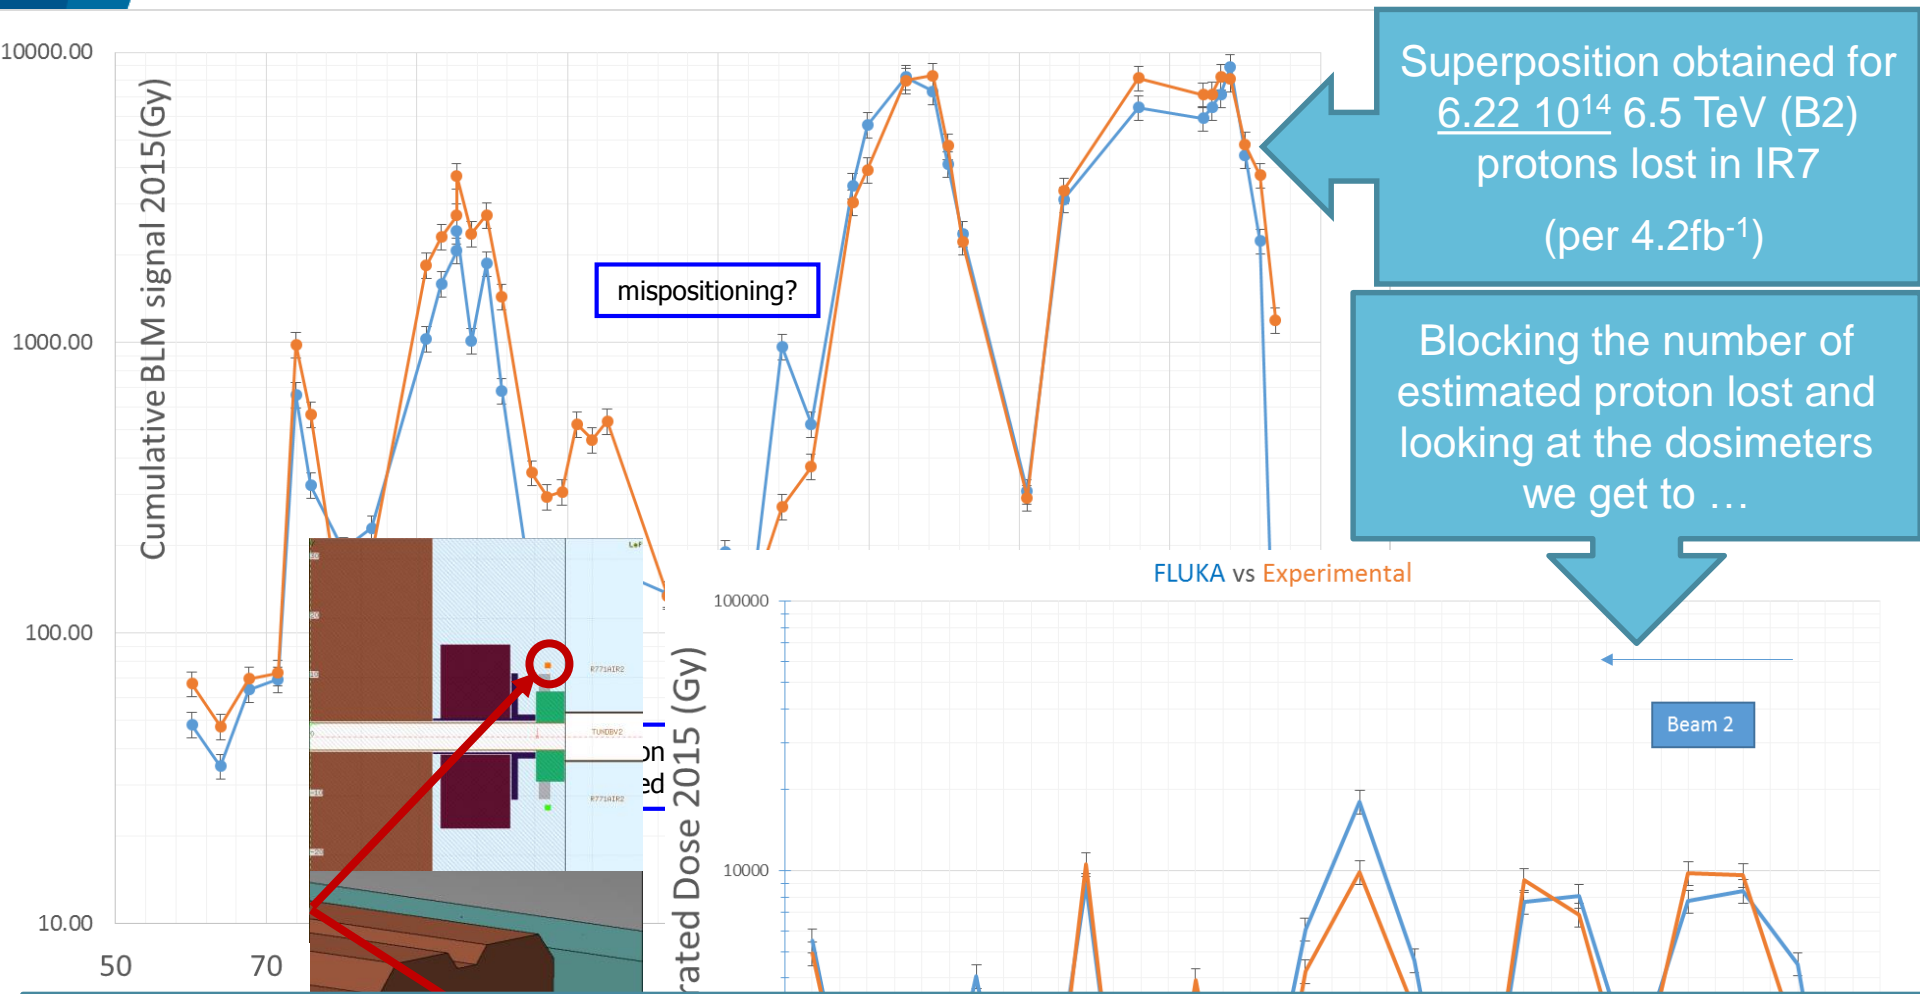

- Recall of last year results from dosimeter reading
- This year dosimeter results
- New scaling
- New estimates
- Preliminary proposal for new action plan
- The design of the protection for LS2 for the elimination of the MQWE5.R(L)7

# IMPORTANT

- THESE ARE PRELIMINARY DATA. FULL DISCUSSION AND VALIDATION WITH THE WP10 COLLEAGUE STILL TO TAKE PLACE
  
- THE NEW SCALING FOR LOSSES SHOWN HERE DOES NOT APPLY TO THE IP 1 AND IP 5. ALL CONSIDERATIONS APPLY ONLY AND EXCLUSIVELY TO THE CLEANING INSERTIONS

# Recall of the analysis progress last year

Year	Direct experimental data	Dose repartition between magnets	Scaling	Material properties	Observations
2013	none	FLUKA analysis for the collimation nominal losses of $1.15 \cdot 10^{16}$ proton/( <b>30</b> -50 fb-1)	Luminosity following proposed scaling that was proposed at IPAC 2013	Extrapolation of previous experimental data of similar resins	
2016	Dosimeters from 2015 RUN	FLUKA analysis for the collimation nominal losses of $1.15 \cdot 10^{16}$ proton/(30- <b>50</b> fb-1)	Luminosity following proposed scaling that was proposed at IPAC 2013	Experimental data of really employed insulation system	Losses and doses lower then expected

$6.22 \cdot 10^{14}$  6.5 TeV (B2) protons lost in IR7

(per  $4.2 \text{ fb}^{-1}$ ) corresponds to  $7.5 \cdot 10^{15}$  proton equivalent losses per  $50 \text{ fb}^{-1}$  (IR7 only, one beam only)

Previous assumption of  $1.15 \cdot 10^{16}$  proton (equivalent) losses per  $50 \text{ fb}^{-1}$  (IR7 only, one beam only) in line with the 2005 estimate of  $1.15 \cdot 10^{16}$  annual proton losses [M. Lamont, LHC Project Note 375]

Based on the next slide, for lifetime projection purposes we conservatively stick to the old loss to lumi ratio for dose estimation

# Recall of the analysis progress what is new

Year	Direct experimental data	Dose repartition between magnets	Scaling	Material properties	Observations
2013	none	FLUKA analysis for the collimation nominal losses of $1.15 \cdot 10^{16}$ proton/( <b>30</b> -50 fb-1)	Luminosity following proposed scaling that was proposed at IPAC 2013	Extrapolation of previous experimental data of similar resins	
2016	Dosimeters from 2015 RUN	FLUKA analysis for the collimation nominal losses of $1.15 \cdot 10^{16}$ proton/(30- <b>50</b> fb-1)	Luminosity following proposed scaling that was proposed at IPAC 2013	Experimental data of really employed insulation system	Losses and doses lower then expected
2017	Dosimeters from 2016 RUN	Based on dosimeters and FLUKA modelling	New scaling	Experimental data	It changes everything

# Integrated luminosity and intensity

## CMS Integrated Luminosity, pp

```
#Integrated intensities (in ps)
```

```
int_2012 = 2.95e21
```

```
int_2015 = 7.61e20
```

```
int_2016 = 2.63e21
```

```
#Integrated Luminosities (in fb-1)
```

```
lum_2012 = 23.3
```

```
lum_2015 = 4.2
```

```
lum_2016 = 40.8
```

EXPECTED ration on lumi scaling  $r=9.8$

# Intensity time integration

Integrated pp intensity in ps  
(in Stable Beam, SB):

2012: **2.95e21** (2.28e21)

2015: **7.61e20** (4.95e20)

2016: **2.63e21** (2.20e21)

Total SB duration:

2012: 1814h

2015: 751h

2016: 1785h

Average intensity per beam  
during SB in p (A):

2012: **1.75e14** (0.31)

2015: **9.15e13** (0.16)

2016: **1.71e14** (0.31)

# P7 integrated BLM losses per integrated intensity

- Similar trend, but already visible that normalized 2016 values are lower

# P3 integrated BLM losses per integrated intensity

- Intensity scaling looks even better for P3 in high-loss region

# P7 scaling for 2015/2016

- Clearly better scaling with intensity, especially in high-loss region (19800-20200) where ratio is mostly near one
- Still, significant outliers (e.g. change in collimator settings?)

# Scaling with integrated intensity

LEFT IR3

RIGHT IR3

LEFT IR7

RIGHT IR7

# New procedure

- Divide each dosimeter recorded dose by the integrated intensity recorded during the time of irradiation (value in Gy/ps)
- For each magnet take the maximum value in Gy/ps between 2015 Run and 2016 Run and between Left and Right (maximum among 4 values)
- Scale those values with the projected integrated intensity
- Thanks to FLUKA models transform the dose on the dosimeter to dose on the coil
- Thanks to FLUKA interpolate missing locations

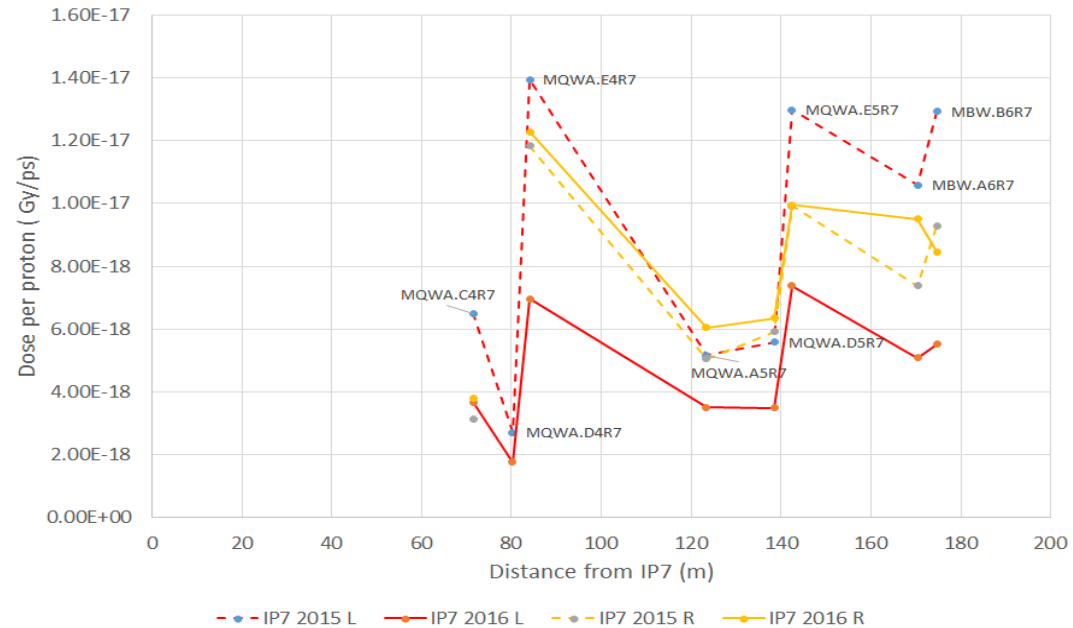

# Maximum in dose per p•s

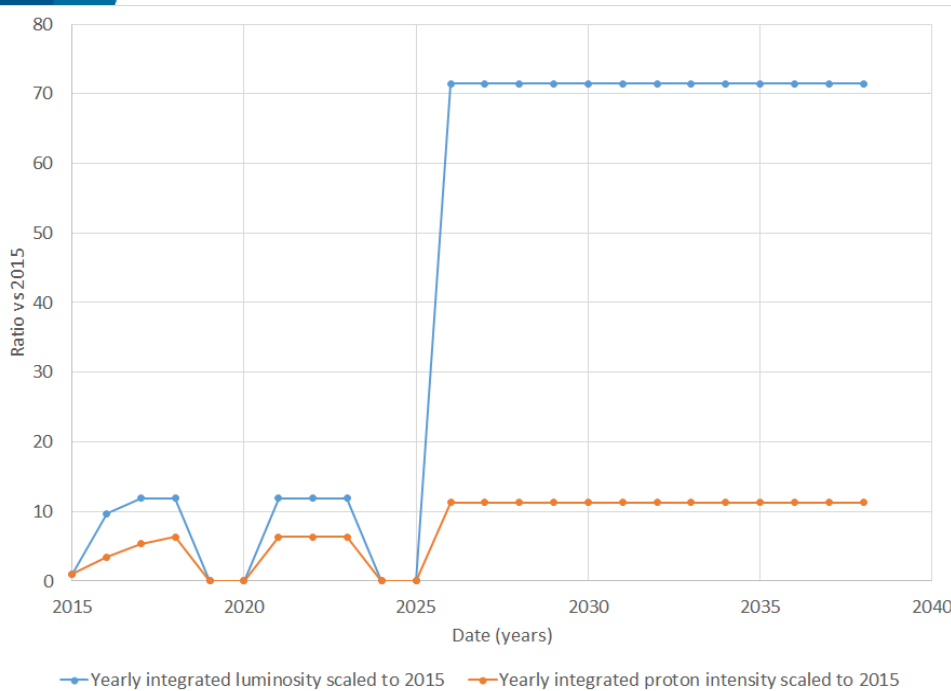

IP3

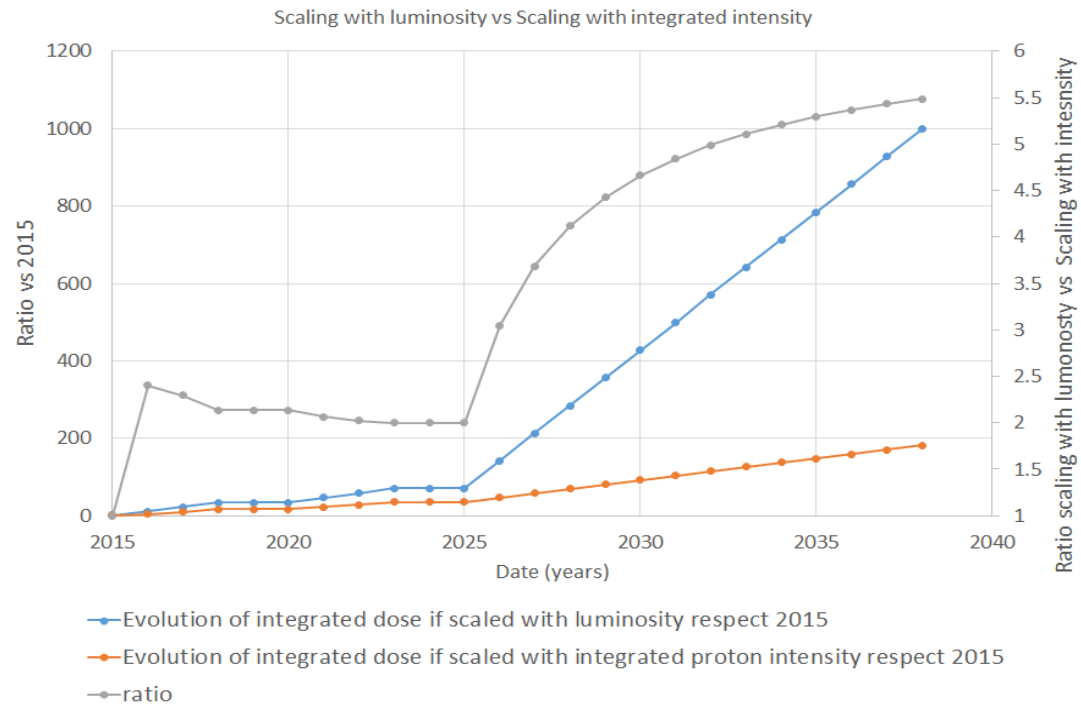

IR 7

# Projected intensity and luminosity evolution and effect on scaling a quantity respect one or the other (2015 equal 1)

Year	Measured Int P intensity 2 beams [p·s]	Estimated Int P intensity 2 beams [p·s]
2016	2.63 e21	2.98 e21
2017		4.1 e21
Typical LHC		4.82 e21
Typical HL-LHC		8.6 e21

# Magnets Coil Dose/damage Forecast Update IR3

Updated values of foreseen peak dose for each involved magnet of IR3 after shielding.

**NEW Materials Limits Applied: MQW: 10-50, 50-75, 75+ . MBW: 50-75, 75-90, 90+**

IR3	Dose [MGy] for integrated luminosity 150 fb <sup>-1</sup> (LS2)		Dose [MGy] for integrated luminosity 350 fb <sup>-1</sup> (LS3)		OLD forecast Dose [MGy] for integrated luminosity 350 fb <sup>-1</sup> (LS3)- OLD LIMITS		Dose [MGy] for integrated luminosity 3000 fb <sup>-1</sup> (LS6)		OLD Forecast Dose [MGy] for integrated luminosity 3000 fb <sup>-1</sup> – OLD LIMITS

# MQW Spacers Dose/Damage Forecast in IR7

Values of foreseen peak dose for each involved MQW Spacer of IR7 after shielding.

**NEW Materials Limits Applied: MQW: 5-10, 10-15, 15+ .**

IR7	Dose [MGy] for integrated luminosity 150 fb <sup>-1</sup> (LS2)		Dose [MGy] for integrated luminosity 350 fb <sup>-1</sup> (LS3)		Dose [MGy] for integrated luminosity 3000 fb <sup>-1</sup> (LS6)		Dose [MGy] for integrated luminosity 4000 fb <sup>-1</sup> (End of HL-LHC)	
	R	L	R	L	R	L	R	L
MQWA.A4	0	0	0	0	2	2	3	2
MQWA.B4	0	0	0	0	3	2	4	3
MQWB.4	0	0	<u>0</u>	<u>0</u>	<u>2</u>	<u>1</u>	<u>2</u>	<u>2</u>
MQWA.C4	1	1	<u>1</u>	<u>1</u>	<b>5</b>	<b>4</b>	<b>7</b>	<b>5</b>
MQWA.D4	0	0	<u>1</u>	<u>0</u>	<u>3</u>	<u>2</u>	4	3
MQWA.E4	<u>1</u>	<u>1</u>	<u>3</u>	<u>2</u>	Exchanged in LS3			
MQWA.A5	1	0	<u>1</u>	<u>1</u>	<u>4</u>	<u>3</u>	<u>5</u>	<u>4</u>
MQWA.B5	1	1	<u>1</u>	<u>1</u>	<b>6</b>	<b>5</b>	<b>8</b>	<b>6</b>
MQWB.5	1	1	<u>1</u>	<u>1</u>	<b>6</b>	<b>5</b>	8	6
MQWA.C5	1	1	<u>2</u>	<u>1</u>	<b>7</b>	<b>5</b>	<b>9</b>	<b>7</b>
MQWA.D5	1	1	<u>2</u>	<u>1</u>	<b>9</b>	<b>7</b>	<b>12</b>	<b>9</b>
MQWA.E5	<u>2</u>	<u>2</u>	Removed in LS2 + Cell Reconfiguration					

MQW Spacers are critical only on magnets that were planned to be removed because of coils damage, however, it might be necessary to extend the shields and increase protection on C5 and D5 magnets spacers during LS2.

# Magnets Coil Dose/Damage Forecast Update IR7

Updated values of foreseen peak dose for each involved magnet of IR7 after shielding.

**NEW Materials Limits Applied: MQW: 10-50, 50-75, 75+ . MBW: 50-75, 75-90, 90+**

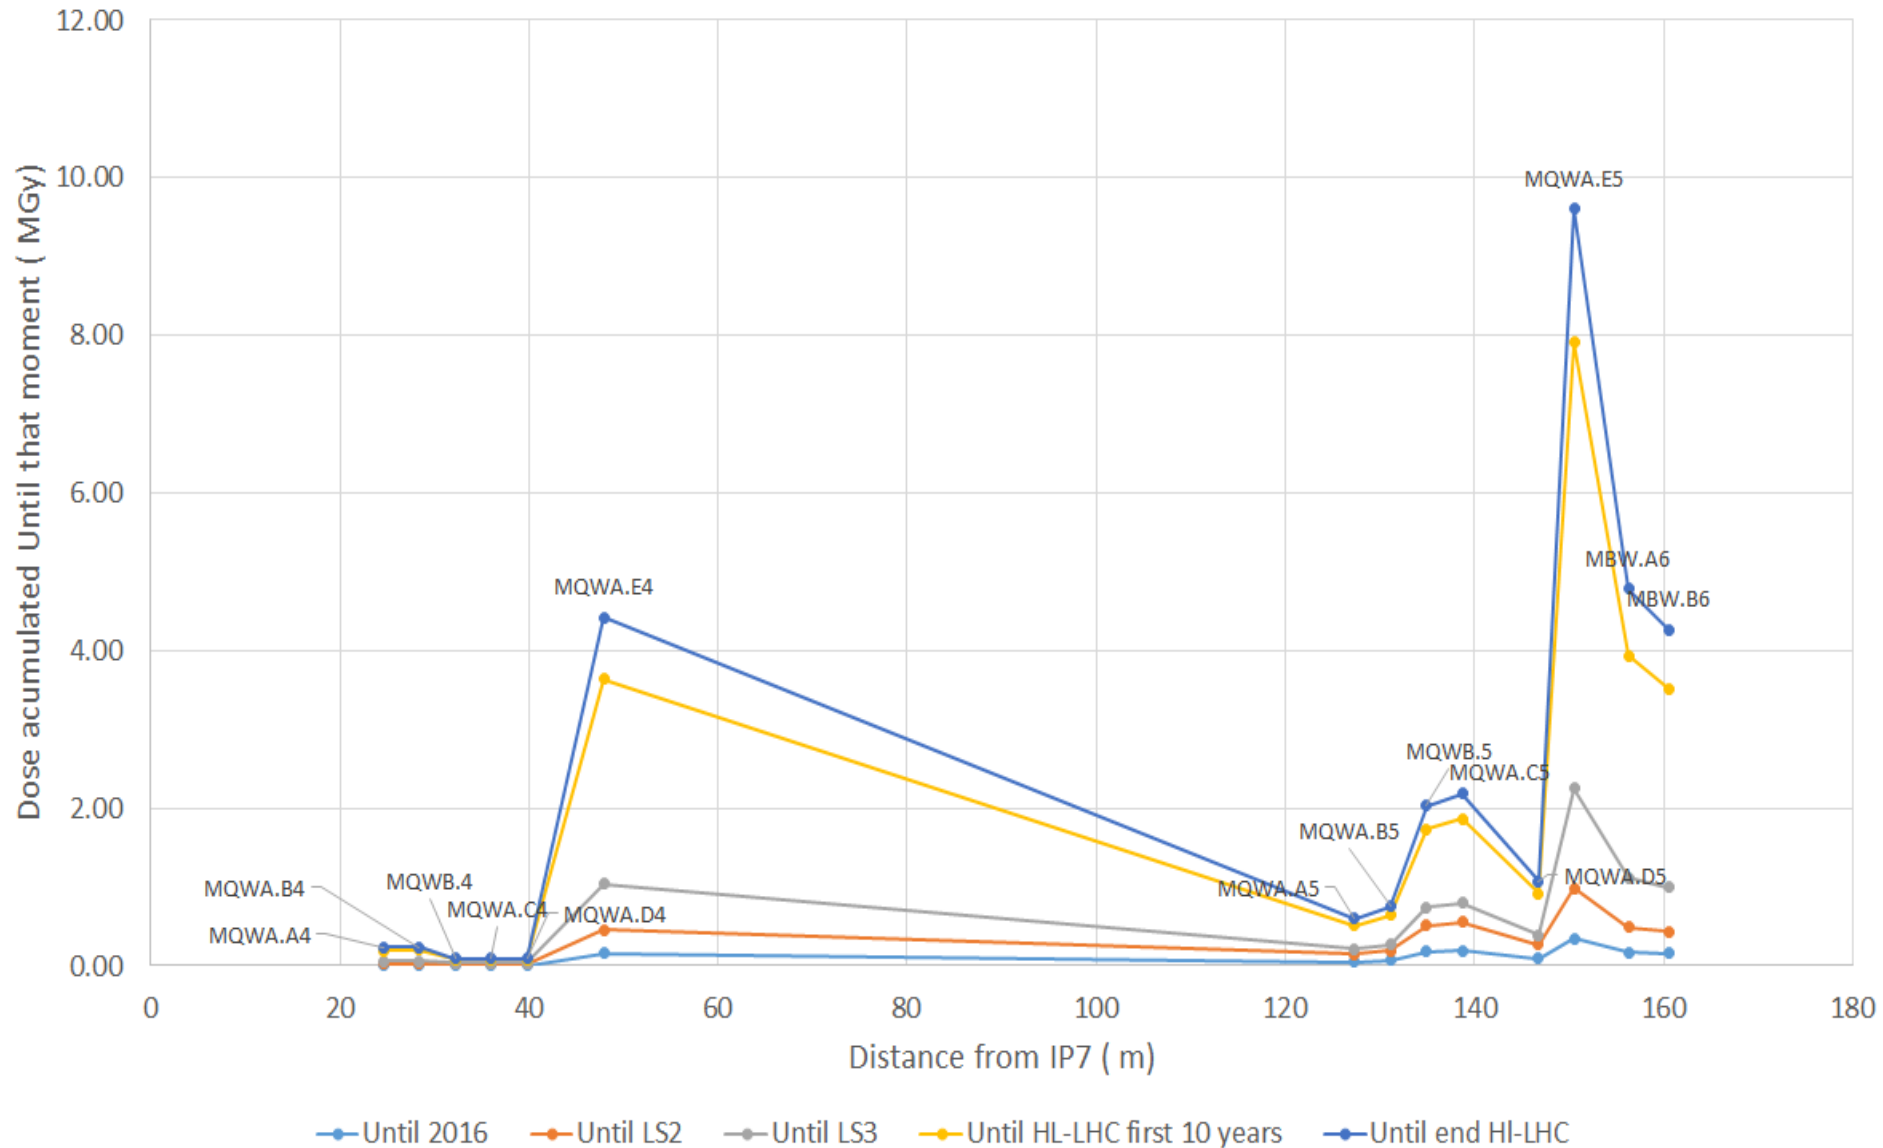

IR7	Dose [MGy] for integrated luminosity 150 fb <sup>-1</sup> (LS2)		Dose [MGy] for integrated luminosity 350 fb <sup>-1</sup> (LS3)		OLD forecast Dose [MGy] for integrated luminosity 350 fb <sup>-1</sup> (LS3)- OLD LIMITS		Dose [MGy] for integrated luminosity 3000 fb <sup>-1</sup> (LS6)		OLD Forecast Dose [MGy] for integrated luminosity 3000 fb <sup>-1</sup> – OLD LIMITS

MQWA.E4	<u>1</u>	<u>1</u>	<u>2</u>	<u>2</u>	<u>2</u>	<u>5</u>	Exchanged in LS3			
MQWA.A5	2	1	<u>2</u>	<u>2</u>	<u>4</u>	<u>4</u>	<u>13</u>	<u>10</u>	<u>10</u>	<u>10</u>
MQWA.B5	3	2	<u>4</u>	<u>3</u>	<u>6</u>	<u>6</u>	<u>18</u>	<u>14</u>	<u>14</u>	<u>14</u>
MQWB.5	3	2	<u>4</u>	<u>3</u>	<u>6</u>	<u>6</u>	<u>18</u>	<u>14</u>	<u>14</u>	<u>14</u>
MQWA.C5	3	2	<u>4</u>	<u>3</u>	<u>3</u>	<u>7</u>	<u>18</u>	<u>14</u>	<u>6</u>	<u>14</u>
MQWA.D5	3	2	5	4	6	8	31	24	17	24
MQWA.E5	<u>3</u>	<u>2</u>	Removed in LS2 + Cell Reconfiguration							
MBW.A6	<u>4</u>	<u>2</u>	<u>7</u>	<u>5</u>	<u>16</u>	<u>12</u>	Exchanged in LS3			
MBW.B6	<u>4</u>	<u>3</u>	<u>9</u>	<u>6</u>	<u>29</u>	<u>14</u>	Exchanged in LS3			

MQW: most exposed units see their estimated dose decreased while, low dose slightly increased

MBW: new forecasts are lower than previous estimations giving more margin.

# Proposal about what to do

When	Action	Comment/Proposal
YETS 2017-2018	Reading of the dosimeter of 2017 run	Confirmed. Revaluation of scaling
LS2	Installation shielding IP3	Confirmed. Procurement placed. Delivery ongoing
	Installation shielding IP7	Confirmed. Procurement placed. Delivery ongoing
	Removal MQWA.E5 IP7	Confirmed. Recovery of 2 spares
RUN 3	Production of 4 sets of rad-hard coils for MBW.	<p>Taking into account that</p> <ol style="list-style-type: none"> <li>1) We have 4 spares</li> <li>2) We have 2 sets of spare coils</li> <li>3) That we could move magnet at dog leg start (before the primaries) to second part (after primaries)</li> </ol> <p>We propose not to procure these units and invest some money in having tooling to open these magnets</p>

# Proposal about what to do

When	Action	Comment/Proposal
RUN 3	Production of 6+1 MQW magnets with rad hard coils.	<p>Taking into account that</p> <ol style="list-style-type: none"><li>1) We have 4 spares</li><li>2) We have 10 of spare coils</li><li>3) We will have 2 spare magnets more from LS2</li></ol> <p>We have 2 proposals</p> <ol style="list-style-type: none"><li>a) TRIUMF agrees to produce 4 sets of coils rad-hard. Replace coils in 4 spare magnets with rad-hard and decision if to change the magnets according to dosimeter reading 1-2 years before LS3</li><li>b) We do not find in kind contribution. We put baseline 4 sets of coils and we decided after 2017 RUN dosimeters data.</li></ol> <p>We need to invest some money in being able to open and close MQWs</p>
