Particulate magnetic tape for data storage and future technologies

Monday 16 October 2017 10:00 (30 minutes)

Enterprise tape drives are widely used at major laboratories in the world, such as CERN, US DoE Labs, KEK and so on as well as data centers in commercial companies. Demands on capacity and speed of I/O inflate infinitely in the tape market. Not only drive technology but also media technology is the key for answering such future requirements. Fujifilm is the world-leading company in the market of magnetic tape media, and has played a major role for evolution of tape technologies in decades.

Secure digital data storage sustainable in very long duration with lower costs is the concern of data centers. Particulate magnetic tapes on linear tape storage systems have been widely used for data backup and archival because of their low TCO, long-term stability, and high reliability. However, in order to meet the further demand, expanding the recording capacity of tape storage is essential. Currently, tape cartridges with a capacity of up to 10 TB are available commercially, and the future roadmap of tape storage systems shows to expand the cartridge capacity to 120 TB. To realize this, technologies to increase the areal density of magnetic tape are required. For this purpose, high-density recording studies using barium ferrite (BaFe) magnetic particles have been carried out. The latest study demonstrated an areal density of 123 Gb/in², corresponding to a 220 TB cartridge capacity in 2015. Furthermore, fine strontium ferrite (SrFe) magnetic particles, which are almost half the size of the current BaFe particles, were also developed; therefore, magnetic tapes are the most effective data storage media to continue enhancing the recording capacity at a low TCO in long-term future.

Modernising CERN document conversion service.

Friday 20 October 2017 09:00 (25 minutes)

The document converter service provides conversion of most office and some engineering applications to PDF, PDF/A or PostScript. The service has been completely rewritten as an OSS [1] and is based on modern IT technology fostered by the CERN IT department. It is implemented as a RESTful API with a containerised approach using the Openshift technology, EOS storage to store documents and jobs, PostgreSQL database, Python3, flask, a Kibana dashboard based on Elastic and its documentation based on gitbook.

The project has been conceived having in mind a multiprocessing design, which allows handling simultaneously several jobs and reducing by more than half the time to process documents, compared to the old service incarnation. It allows adding different converter software, presently using Neevia [2]. The design allows to easily scale up thanks to the technology used, which is HAProxy + Openshift as web interface and Openstack VM's, Windows 2012R2 servers, as worker nodes in the backend.

Currently, the document converter service is mainly used by services like Indico [3] or EDMS [4] to automate conversion of thousands of documents.

Migration from Grid Engine to HTCondor

Wednesday 18 October 2017 11:25 (25 minutes)

The migration of the local batch system BIRD required the adaptation of different properties like the Kerberos / AFS support, the automation of various operational tasks and the user and project access. The latter includes, inter alia, fairshare, accounting and resource access. For this, some newer features of HTCondor had to be used. We are close to the user release. Building common dynamic resources for local and grid-based batches is still in process. The talk provides some details about Kerberos support, authentication within the operating automation, job timing, and registry integration.

Follow-up about Wi-Fi service enhancement at CERN

Tuesday 17 October 2017 16:25 (25 minutes)

As presented during HEPiX Fall 2016, a full renewal of the CERN Wi-Fi network was launched in 2016 in order to provide a state-of-the-art Campus-wide Wi-Fi Infrastructure. This year, the presentation will give a status and feedback about this overall deployment. It will provide information about the technical choices made, the methodology used for such a deployment, the issues we faced and how we solved them, our interaction with the manufacturer, and an overview of the current project status and schedule.

Firewall Load-Balancing solution at CERN

Tuesday 17 October 2017 17:15 (25 minutes)

The CERN network infrastructure has several links to the outside world. Some are well identified and dedicated for experiments and research traffic (LHCOPN/LHCONE), some are more generics (general internet). For the latter, a specific firewall inspection is required for obvious security reasons, but with tens of gigabits per second of traffic, the firewalls capacities are highly challenged. This presentation will explain how CERN plans to move from a static firewall setup with limited capacity to a more flexible design using a Firewall Load Balancing solution. It will present the current setup, the on-going migration to a temporary firewall load balancing solution, and the long-term plans.

PDSF Site Report and Transition

Tuesday 17 October 2017 11:15 (15 minutes)

PDSF, the Parallel Distributed Systems Facility, was moved to Lawrence Berkeley National Lab from Oakland CA in 2016. The cluster has been in continuous operation since 1996 serving high energy physics research. The cluster is a tier-1 site for Star, a tier-2 site for Alice and a tier-3 site for Atlas.

The PDSF cluster is in transition this year, moving the batch system from UGE to SLURM and to delivering computing environments using Shifter, a NERSC software package for deploying docker-like containers. In the near two years, the Linux cluster hosting PDSF will be retired and its workloads will be moved to a Cray XC-40 system. This site report will describe recent updates to the system, upcoming transitions, and the future of High Energy Physics workloads at NERSC.

Configuration automation for CERN's new Wi-Fi infrastructure

Tuesday 17 October 2017 16:50 (25 minutes)

As presented at HEPiX Fall 2016, CERN is currently in the process of renewing its standalone Wi-Fi Access Points with a new state-of-the-art, controller-based infrastructure. With more than 4000 new Access Points to be installed, it is desirable to keep the existing deployment procedures and tools to avoid repetitive and error-prone actions during configuration and maintenance steps. This presentation will dive into the new controller setup and will focus on the in-house software and workflows that power configuration automation for the new Wi-Fi infrastructure.

Using Configuration Management to deploy and manage network services

Tuesday 17 October 2017 16:00 (25 minutes)

Configuration Release Management (CRM) is rapidly gaining popularity among service managers, as it brings version control, automation and lifecycle management to system administrators. At CERN, most of the virtual and physical machines are managed through the Puppet framework, and the networking team is now starting to use it for some of its services.

This presentation will focus on the specificities of using CRM for network services, and will list a few pitfalls that can be avoided.

AutoGOLE bringing high speed data transfers

Monday 16 October 2017 15:15 (25 minutes)

The Automated GOLE (AutoGOLE) fabric enables research and education networks worldwide to automate their inter-domain service provisioning. By using the AutoGOLE control plane infrastructure, services to other countries can be setup in minutes. Besides automated provisioning we experiment with connecting high-speed Data Transfer Nodes (DTNs) to the AutoGOLE environment. This talk will discuss current possibilities, performance and future plans.

Singularity at the RACF/SDCC

Wednesday 18 October 2017 14:25 (25 minutes)

In this presentation, we'll give an overview of the Singularity container system, and our experience with it at the RACF/SDCC at Brookhaven National Laboratory. We'll also discuss Singularity's advantages over virtualization and other Linux namespace-based container solutions in the context of HTC and HPC applications. Finally, we'll detail our future plans for this software at our facility.

A user portal at CCINP3

Friday 20 October 2017 09:25 (25 minutes)

CCIN2P3 is one of the largest academic data centres in France. Its main mission is to provide the particle, astroparticle and nuclear physics community with IT services, including large-scale compute and storage capacities. We are a partner for dozens of scientific experiments and hundreds of researchers that make a daily use of these resources.

It is essential for users to have at their disposal simple tools to monitor their activity and incidents, in order to use our services efficiently. Although this monitoring information exists today, it is not exposed to users in a fully centralized and easy-to-access way. Therefore, we have been developing since spring a web portal providing useful monitoring displays and pointers to service documentations.

With this presentation, we would like to show what we have implemented so far, share our thoughts on how to display the information to the users, and hopefully exchange ideas with the HEPiX community.

Tier-1 networking cost and optimizations

Monday 16 October 2017 17:00 (25 minutes)

As the WLCG data sets grow ever bigger, so will network usage. For those of us with limited budgets, it would be nice if network costs won't get ever bigger too.

As NDGF is one of the few tier-1 sites in WLCG required to pay full networking costs, including transit, we'll look at the cost breakdown of networking for a tier-1 site and talk about where optimizations might be found.

WLCG/OSG Networking Update

Monday 16 October 2017 14:25 (25 minutes)

WLCG relies on the network as a critical part of its infrastructure and therefore needs to guarantee effective network usage and prompt detection and resolution of any network issues, including connection failures, congestion and traffic outing. The OSG Networking Area is a partner of the WLCG effort and is focused on being the primary source of networking information for its partners and constituents. We will report on the changes and updates that have occurred since the last HEPiX meeting.

The WLCG Throughput working group was established to ensure sites and experiments can better understand and fix networking issues. In addition, it aims to integrate and combine all network-related monitoring data collected by the OSG/WLCG infrastructure from both network and transfer systems. This has been facilitated by the already existing network of the perfSONAR instances that is being commissioned to operate in full production.

We will provide a status update on the LHCOPN/LHCONE perfSONAR infrastructure as well as cover recent changes in the higher level services that were developed to help bring perfSONAR network to its full potential. This includes a new set of dashboards based on Grafana that offer a combined view on network utilisation and network performance as measured by RENs, WLCG transfers and perfSONAR; updates and changes to the Web-based mesh configuration system and OSG network datastore (esmond), which collects, stores and provides interfaces to access all the network monitoring information from a single place.

In addition, we will provide an overview of the recent major network incidents that were investigated with the help of perfSONAR infrastructure and provide information on changes that are included in the recent release of version 4.0.1 of the perfSONAR Toolkit. We will also cover the status of our WLCG/OSG deployment and provide some information on our future plans.

Using Docker containers for scientific environments - on-premises and in the cloud

Wednesday 18 October 2017 15:10 (20 minutes)

Docker container virtualization provides an efficient way to create isolated scientific environments, adjusted and optimized for a specific problem or a specific group of users. It allows to efficiently separate responsibilities - with IT focusing on infrastructure for image repositories, preparation of basic images, container deployment and scaling, and physicists focusing on application development in environment of their choice.

Depending on demand, compute resources can be dynamically provisioned and a containerised scientific environment can be deployed in a matter of seconds on a user laptop, a batch farm, an HPC cluster or a cloud without need for a user to learn new environment, install additional libraries, resolve dependencies, recompile applications.

The present talk will describe DESY's experience with providing Docker service on our HPC cluster and report progress in using cloud to transparently and elastically extend containerised scientific environments - a work being done within the HELIX NEBULA Science Cloud project.

Network Functions Virtualisation Working Group Proposal

Monday 16 October 2017 17:25 (25 minutes)

High Energy Physics (HEP) experiments have greatly benefited from a strong relationship with Research and Education Network (REN) providers and thanks to the projects such as LHCOPN/LHCONE and REN contributions, have enjoyed significant capacities and high performance networks for some time. RENs have been able to continually expand their capacities to over-provision the networks relative to the experiments needs and were thus able to cope with the recent rapid growth of the traffic between sites, both in terms of achievable peak transfer rates as well as in total amount of data transferred. For some HEP experiments this has led to designs that favour remote data access where network is considered an appliance with almost infinite capacity. There are reasons to believe that the network situation will change due to both technological and non-technological reasons starting already in the next few years. Various non-technological factors that are in play are for example anticipated growth of the non-HEP network usage with other large data volume sciences coming online; introduction of the cloud and commercial networking and their respective impact on usage policies and securities as well as technological limitations of the optical interfaces and switching equipment.

As the scale and complexity of the current HEP network grows rapidly, new technologies and platforms are being introduced, collectively called Network Functions Virtualisation (NFV), ranging from software-based switches such as OpenVSwitch, Software Defined Network (SDN) controllers such as OpenDaylight up to full platform based open solutions such as Cumulus Linux. With many of these technologies becoming available, it's important to understand how we can design, test and develop systems that could enter existing production workflows while at the same time changing something as fundamental as the network that all sites and experiments rely upon. As this is not the only activity in the area and there are many different projects already running, it's important to find the effort to contribute and coordinate various different networking activities within HEP.

In this talk we'll describe these challenges and propose the formation of a NFV working group that would evaluate the existing technologies and provide guidance on their performance and adoption to the sites and experiments.

Low-Power Wide-Area Network (LPWAN) at CERN

Wednesday 18 October 2017 16:00 (25 minutes)

The interest in the Internet of Things (IoT) is growing exponentially so multiple technologies and solutions have emerged to connect mostly everything. A 'thing' can be a car, a thermometer or a robot that, when equipped with a transceiver, will exchange information over the internet with a defined service. Therefore, IoT comprises a wide variety of user cases with very different requirements.

Low-Power Wide-Area Network (LPWAN) focuses on low-cost devices that need to operate on batteries for long periods and that send small volumes of data. LPWAN offers wireless connectivity for large areas and complements other technologies such as cellular machine-to-machine (M2M), Wi-Fi or personal area networks (PAN).

CERN has studied different options to offer wireless connectivity to non-critical sensors with very low throughput requirements and is preparing the deployment of an LPWAN network campus-wide. Provisioning and identity management, security and confidentiality, surface and underground availability or reliability and QoS have been some of the topics addressed during the network design.

Deployment of IPv6-only CPU on WLCG - an update from the HEPiX IPv6 Working Group

Tuesday 17 October 2017 15:05 (25 minutes)

This update from the HEPiX IPv6 Working Group will present the activities of the last 6-12 months. In September 2016, the WLCG Management Board approved the group's plan for the support of IPv6-only CPU, together with the linked requirement for the deployment of production Tier 1 dual-stack storage and other services. A reminder of the requirements for support of IPv6 and the deployment timelines of the plan will be presented. The current status will be reviewed including the deployment of dual-stack storage at the WLCG Tier 1s as well as the status and plans for deployment at Tier 2s.

riemann: a different stream processor

Thursday 19 October 2017 14:50 (25 minutes)

We present *riemann*: a low-latency transient shared state stream processor. This opensource monitoring tool is written by Kyle Kingsbury and maintained by the community. Its unique design makes it as flexible as it gets by melting the walls between configuration and code. Whenever its rich API doesn't fit the use-case, it's as simple as using any library in the *clojure* or *java* ecosystem and importing it into the configuration.

We present *riemann*'s basic concepts, as well as some key elements of its API. Moreover, we illustrate its usefulness in our Tier-1 by showing a few examples of use-cases at *CC-IN2P3*.

For instance, its ability to aggregate thousands of metrics along high-level metadata keys using straightforward configuration entries is illustrated. Its integration with other monitoring tools like *Nagios*, *InfluxDB*, *Elasticsearch*, etc. is presented.

Securing Elasticsearch for free: integration with SSO and Kerberos at CC-IN2P3

Thursday 19 October 2017 14:00 (25 minutes)

It is now a well-known fact in the *HEPiX* community that the *Elastic* stack (FKA *ELK*) is an extremely useful tool to dive into huge log data entries. It has also been presented multiple times as lacking the security features so often needed in multi-user environments. Although it now provides a plugin addressing some of those concerns, it requires the acquisition of a commercial license.

We present *floragunn's Searchguard*: an *Elasticsearch* plugin that provides authentication, authorization and encryption. It also bundles a *Kibana* plugin that offers multi-tenant views and dashboards. We then focus on its integration with *Kerberos*, *CAS* (SSO) and *syslog-ng* at *CC-IN2P3*. If time permits we'll present gotchas and performance considerations.

Cloud storage with the Dynafed data federator

Thursday 19 October 2017 11:50 (25 minutes)

We describe our use of the Dynafed data federator with cloud computing resources. Dynafed (developed by CERN IT) allows a dynamic data federation, based on the webdav protocol, with the possibility to have a single name space for data distributed over all available sites. It also allows a failover to another copy of a file in case the connection to the closest file location gets interrupted which makes it very robust and reliable in usage.

Specifically, we report on the challenges and progress on the implementation within the ATLAS and Belle II experiments, the implementation of GRID based authentication and authorization, and the use of S3 storage with Dynafed.

Hot days with no mechanical cooling data center

Wednesday 18 October 2017 14:00 (25 minutes)

I'll talk about how the data collect helped the center get through a heat wave in the Berkeley area. This is significant since Berkeley computing center does not have any mechanical cooling and relies on the external air temperature and water supply. Talking about what data we thought we needed and what data we did need and how the idea of saving all the data and collecting as much as we can actually helped us in the lesson learned sessions after the event.

Running HEP Payloads on Distributed Clouds

Wednesday 18 October 2017 14:50 (20 minutes)

The University of Victoria HEP group has been successfully running on distributed clouds for several years using the CloudScheduler/HTCondor framework. The system uses clouds in North America and Europe including commercial clouds. Over the last years, the operation has been very reliably, we are regularly running several thousands of jobs concurrently for the ATLAS and Belle II experiments. Currently we are writing a new version of CloudScheduler (version 2) that aims at further increasing the scale of number of jobs to levels in excess of 10,000. Further, it will be easier to configure existing and new clouds, as well as automate more of the operation of the clouds. We describe our operation experience and review the planned changes to the system.

Optimising the resource needs for the LHC computing: ideas for a common approach

Wednesday 18 October 2017 12:15 (25 minutes)

The increase of the scale of LHC computing expected for Run 3 and even more so for Run 4 (HL-LHC) over the course of the next 10 years will most certainly require radical changes to the computing models and the data processing of the LHC experiments. Translating the requirements of the physics programme into resource needs is an extremely complicated process and subject to significant uncertainties. Currently there is no way to do that without using complex tools and procedures developed internally by each LHC collaboration. Recently there has been much interest in developing a common model for estimating resource costs, which would be beneficial for experiments, WLCG and sites and in particular to understand and optimise the path towards HL-LHC. For example, it could be used to estimate the impact of changes in the computing models or to optimise the resource allocation at the site level. In this presentation we expose some preliminary ideas on how this could be achieved, with a special focus on the site perspective and provide some real world examples.

EGI CSIRT: Keeping EGI Secure

Thursday 19 October 2017 09:00 (25 minutes)

The EGI CSIRT main goal is, in collaboration with all resources providers, to keep the EGI e-Infrastructure running and secure. During the past years, under the EGI-Engage project, the EGI CSIRT has been driving the infrastructure in term of incident prevention and response, but also security training. This presentation provides an overview of these activities, focusing on the impact for the community, before concluding on current and future challenges for our infrastructures.

This talk is based on contributions and input from participants in the EGI CSIRT activities.

Security update

Thursday 19 October 2017 09:25 (25 minutes)

This presentation gives an overview of the current computer security landscape. It describes the main vectors of compromises in the academic community including lessons learnt, and reveal inner mechanisms of the underground economy to expose how our resources are exploited by organised crime groups, as well as recommendations to protect ourselves. By showing how these attacks are both sophisticated and profitable, the presentation concludes that the only mean to adopt and appropriate response is to build a tight international collaboration and trusted information sharing mechanisms within the community.

Migrating a WLCG tier-2 to a Cray XC-50 at CSCS-LCG2

Wednesday 18 October 2017 11:50 (25 minutes)

Founded in 1991, CSCS, the Swiss National Supercomputing Centre, develops and provides the key supercomputing capabilities required to solve important problems to science and/or society. The centre enables world-class research and provides resources to academia, industry and the business sector. Through an agreement with CHIPP, the Swiss Institute of Particle Physics, CSCS hosts a WLCG tier-2 site, delivering computing and storage services to the ATLAS, CMS and LHCb experiments. In this presentation, we will describe the ongoing efforts in migrating all the tier-2 compute workloads for the served experiments from a dedicated x86_64 cluster that has been in continuous operation and evolution since 2007, to Piz Daint, the current European flagship HPC, which ranks third in the TOP500 at the time of writing.

Techlab update

Wednesday 18 October 2017 09:55 (25 minutes)

Techlab is a CERN IT activity aimed at providing facilities for studies improving the efficiency of the computing architecture and making better utilisation of the processors available today.

It enables HEP experiments, communities and project to gain access to machines of modern architectures, for example Power 8, GPUs and ARM64 systems.

The hardware is periodically updated based on community feedback and industry trends. All results can be published; studies requiring non-disclosure agreements (NDAs) are not allowed.

Techlab also runs extensive evaluations of all its systems and makes them available on its benchmarking portal, which is open for all HEP participants to view and share benchmarking results.

This presentation gives a status update of Techlab, including service status, current hardware and plans, and gives an overview of the benchmarking portal.

NetSage, a unified network measurement and visualization service

Monday 16 October 2017 16:35 (25 minutes)

Modern science is increasingly data-driven and collaborative in nature, producing petabytes of data that can be shared by tens to thousands of scientists all over the world. NetSage is a project to develop a unified open, privacy-aware network measurement, and visualization service to better understand network usage in support of these large scale applications. New capabilities to measure and analyze the utilization of international wide-area networks are essential to ensure end-users are able to take full advantage of such infrastructure. NetSage was developed to support the US National Science Foundation international networking program, but can be deployed in other settings. This talk will offer an overview of the project and emphasize recent developments within the project.

Recent network connectivity around KEK

Tuesday 17 October 2017 14:00 (20 minutes)

Last year, KEK had upgraded the upstream link to 100Gbps in Apr. then officially started the peer with LHCONE since Sep. Then KEK can distribute huge data to WLCG sites by adequate throughput although this upgrade didn't made large impact on the firewalls for the ordinary internet usage from the campus network.

We will report changes by the LHCONE peer and how we connect our campus network and computing resources, and the data acquisition system for Belle II that will be a major source of rawdata on our computing resource.

Netbench –testing network devices with real-life traffic patterns

Tuesday 17 October 2017 14:40 (25 minutes)

Network performance is key to the correct operation of any modern datacentre or campus infrastructure. Hence, it is crucial to ensure the devices employed in the network are carefully selected to meet the required needs.

The established benchmarking methodology [1,2] consists of various tests that create perfectly reproducible traffic patterns. This has the advantage of being able to consistently assess the performance differences between various devices, but comes at the disadvantage of always using known, pre-defined traffic patterns (frame sizes and traffic distribution) that do not stress the buffering capabilities of the devices to the same extent as real-life traffic would.

Netbench is a network-testing framework, based on commodity servers and NICs, that aims at overcoming the previously mentioned shortcoming. While not providing identical conditions for every test, netbench enables assessing the devices' behaviour when handling multiple TCP flows, which closely resembles real-life usage.

Furthermore, due to the prohibitive cost of specialized hardware equipment that implements RFC tests [1,2], few companies/organisations can afford a large scale test setup. The compromise that is often employed is to use two hardware tester ports and feed the same traffic to the device multiple times through loop-back cables (the so called "snake-test"). This test fully exercises the per-port throughput capabilities, but barely stresses the switching engine of the device in comparison to a full-mesh test [3]. The per-port price of a netbench test setup is significantly smaller than that of a testbed made using specialized hardware, especially if we take into account the fact that generic datacentre servers can be time-shared between netbench and day-to-day usage. Thus, a large-scale multi-port netbench setup is easily affordable, and enables organisations/companies to complement the snake test with benchmarks that stress test the switching fabric of network devices.

The presentation will cover the design of the netbench software platform and subsequently present results from a recent evaluation of high-end routers conducted by CERN.

Netbench has a layered architecture and uses standard technologies. At its core, it relies on iperf3 [4] as an engine to drive TCP flows between servers. The orchestration platform that sets up multiple iperf3 sessions is written in Python and relies on XML-RPC for fast provisioning of flows. Per-flow statistics are gathered into a PostgreSQL database, and the results visualisation is based on a Python REST API and a web page using JavaScript and the D3.js library for displaying graphs. Statistics are presented at different levels of detail allowing the human tester to quickly assess the overall state of a test from both per-node and per-pair (source-destination) statistics.

During its last call for tender for high-end routers, CERN has employed netbench for evaluating the behaviour of network devices when exposed to meshed TCP traffic. We will present results from several devices. Furthermore, during the evaluation it became apparent that, due to the temporary congestion caused by competing TCP flows, netbench provides a good estimation of the devices' buffering capabilities.

To summarize, we present netbench, a tool that allows provisioning TCP flows with various traffic distributions (pairs, partial and full-mesh). We consider netbench an essential complement to synthetic RFC tests [1][2], as it enables affordable, large-scale testing of network devices with traffic patterns that closely resemble real-life conditions.

Wigner Datacenter's new software defined datacenter architecture

Thursday 19 October 2017 16:10 (25 minutes)

Our cloud deployment at Wigner Datacenter (WDC) is undergoing significant changes. We are adapting a new infrastructure, an automated OpenStack deployment using TripleO and configuration management tools like Puppet and Ansible. Over the past few months, our team at WDC have been testing TripleO as the base of our OpenStack deployment. We are also planning a centralized monitoring and logging system and open-source firewall solution.

The goal is to create an highly scalable and secure open-source SDDC (software defined datacenter) for the scientific community. In this presentation we are going to show the software and the toolset we use, and our progress and challenges so far.

Storage for Science at CERN

Thursday 19 October 2017 11:10 (25 minutes)

In this contribution the vision for the CERN storage services and their applications will be presented.

Traditionally, the CERN IT Storage group has been focusing on storage for Physics data. A status update will be given about CASTOR and EOS, with the recent addition of the Ceph-based storage for High-Performance Computing.

More recently, the evolution has focused on providing higher-level tools to access, share and interact with the data. CERNBox is at the center of this strategy, as it provides the broader scientific community with high level applications (Office, SWAN) to interact with the data. Examples of ongoing collaborations with other non-HEP institutes will be given, where scientists are directly enabled to perform their data processing, leveraging this approach.

Integrated Monitoring results at IHEP

Thursday 19 October 2017 15:15 (25 minutes)

Various cluster monitoring tools are adapted or developed at IHEP, which show the health status of each device or aspect of IHEP computing platform separately. For example, Ganglia shows the machine load, Nagios monitors the service status, and Job-monitor tool developed by IHEP counts the job success rate and so on. But those monitoring data from different tools are independent and not easy to be analyzed relatively. Integrate and analysis all the monitoring data from multiple sources can provide more valuable information such as health trends and potential errors.

Now, Integrated Monitoring Tools are deployed at IHEP which collects Ganglia, Nagios, Syslog and other monitor metrics. Some cluster monitoring projects based on this Integrated Monitoring Tools have been applied to IHEP.

Network related updates in IHEP

Tuesday 17 October 2017 14:20 (20 minutes)

We give the design and plan of network architecture updates in IHEP at HEPiX Spring 2017, and it has been finished in August 2017. This report talks about the network architecture upgrades, Dual stack ipv6 test, network measurement and morning at IHEP and network security upgrades.

GSI Site Report

Wednesday 18 October 2017 09:15 (15 minutes)

News and updates from GSI IT, e.g.:

- status GreenITCube
- new asset management system

Fancy Networking

Wednesday 18 October 2017 16:25 (25 minutes)

We've redesigned our HPC/Grid network to be capable of full network function virtualisation, to be prepared for large amounts of 100Gbps connections, and to be 400G ready. In this talk we want to take you through the design considerations for a fully non-blocking 6 Tbps virtual network, and what type of features we have build-in for the cloudification of our clusters using OpenContrail. Through the integration of OpenContrail and OpenStack, we will be able to offer fully virtualised machines (and containers) for both IaaS and the (grid) Platform service, while retaining high-performance access to both local storage and our global network peers at 100+ Gbps.

In support of our wide area plans, in the beginning of this year we've done experiments using novel (and at that time experimental) DWDM equipment from Juniper between Amsterdam and Geneva, in collaboration with SURFnet and CERN.

We want to share the results and the pitfalls of these type of connections and why it is useful to do these tests.

Network Automation for Intrusion Detection System

Wednesday 18 October 2017 16:50 (25 minutes)

CERN networks are dealing with an ever-increasing volume of network traffic. The traffic leaving and entering CERN must be precisely monitored and analysed to properly protect the networks from potential security breaches. To provide the required monitoring capabilities, the Computer Security team and the Networking team at CERN have joined efforts in designing and deploying a scalable Intrusion Detection System (IDS). The initial setup, presented at the HEPiX Fall 2016 Workshop in Berkeley, featured a Brocade MLXe configured with OpenFlow to provide dynamic offload and selecting mirroring capabilities. Due to technical requirements, the setup has been evolved and currently leverages the Brocade SLX platform with network automation software (StackStorm / Brocade Workflow Composer) deployed for additional programmability and flexibility. The new technology stack is under testing with a promising perspective of production deployment in 2018.

Deployment and monitoring for distributed computing sites

Thursday 19 October 2017 17:25 (25 minutes)

Now IHEP can provide maintenance for those distributed computing sites, such as USTC and BUAA. We use both puppet and foreman to achieve these sites' automatic deployment and configuration, OS installation, system configuration and software upgrade. In order to realize unified maintenance, We adopt nagios to monitor this site's healthy status, including network, system, storage, services, etc. Mod-gearman, a module enable nagios to monitor remote sites, integrates remote monitor information into IHEP monitoring system. If sites have any errors, administrators at IHEP can use remote tools to handle these errs.

CEPH at RAL

Wednesday 18 October 2017 17:15 (25 minutes)

In March 2017 Echo went in to production at the RAL Tier 1 providing over 7PB of usable storage to WLCG VOs. This talk will present details of the setup and operational experience gained from running the cluster in production.

Running Jobs Everywhere: an Overview of Batch Services at CERN

Wednesday 18 October 2017 11:15 (10 minutes)

Batch services at CERN have diversified such that computing jobs can be run everywhere, from traditional batch farms, to disk servers, to people's laptops, to commercial clouds. This talk offers an overview of the technologies and tools involved.

Automatic shutdown of servers in case of A/C failure

Thursday 19 October 2017 17:50 (10 minutes)

Following various A/C incidents in an Oxford Computer room, we developed a solution to automatically shutdown servers.

The solution has two parts the service which monitors the temperatures and publishes on a web page and the client which runs on the servers, queries the result to determine if shutdown is required. Digttemp software and one wire temperature sensors are used.
