# Cosmic Ray Observations at the ISS and CALET

## Overview of CALET Observations

- ❑ Direct cosmic ray observations in space at highest energy region
- ❑ Cosmic ray observation at world-record level using a large-scale detector at ISS for a long-term (5 years expected)
- ❑ Electron observation in 1 GeV - 20 TeV is achieved with high energy resolution due to optimization for electron detection
  - ➡ Search for Dark Matter and Nearby Sources
- ❑ Observation of cosmic-ray nuclei will be performed in energy region from 10 GeV to 1 PeV
  - ➡ Unravelling the CR acceleration and propagation mechanism
- ❑ Detection of transient phenomena in space by stable observations
  - ➡ Gamma-ray burst, Solar flare, Radiation from GW source etc.

# CALET Payload

Kounotori (HTV) 5

Launched on Aug. 19<sup>th</sup>, 2015 by the Japanese H2-B rocket

Emplaced on JEM-EF port #9 on Aug. 25<sup>th</sup>, 2015 (JEM-EF: Japanese Experiment Module-Exposed Facility)

JEM/Port #9

- Mass: 612.8 kg
- JEM Standard Payload Size: 1850mm(L) × 800mm(W) × 1000mm(H)
- Power Consumption: 507 W (max)
- Telemetry: Medium 600 kbps (6.5GB/day) / Low 50 kbps

# Attached Location (JEM-EF Port No.9) and the FOV

CALET has a Field-Of-View of  $45^\circ$  from its position at Port No.9. (A small part of the FOV is covered by thin structural material).

**CALET located at the Port No.9  
at the Japanese Experiment Module**

**ISS simplified model**

**CALET FOV**

Readout	PMT+CSA	64-anode PMT+ ASIC	APD/PD+CSA PMT+CSA (for Trigger)@top layer

# Energy Measurement in Dynamic Range of 1-10<sup>6</sup> MIP in TASC

The whole dynamic range was calibrated by UV laser irradiation on ground :

- 1) The linearity of each gain range is confirmed in the range of 1.4-2.5 %.
- 2) Each channel cover from 1 MIP to 10<sup>6</sup> MIPs.

APD-H	APD-L	PD-H	PD-L
1.4%	1.5%	2.5%	2.2%

The correlation between adjacent gain ranges is calibrated by using in-flight data in each channel.

APD-H APD-L	APD-L PD-H	PD-H PD-L
0.1%	0.7%	0.1%

Example of energy distribution in one PWO log

# Energy Deposit Distribution of All Triggered-Events by Observation for 901 days

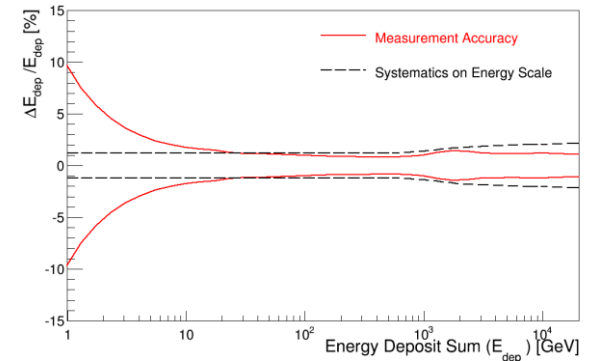

Distribution of deposit energies ( $\Delta E$ ) in TASC

The TASC energy measurements have successfully been carried out in the dynamic range of 1 GeV - 1 PeV.

Y.Asaoka, Y.Akaike, Y.Komiya, R.Miyata, S.Torii et al. (CALET Collaboration), *Astropart. Phys.* 91 (2017) 1.

Performance of energy measurement in 1GeV-20TeV

Energy resolution for electrons (TASC+IMC): < 3% over 10 GeV; < 2% over 100 GeV

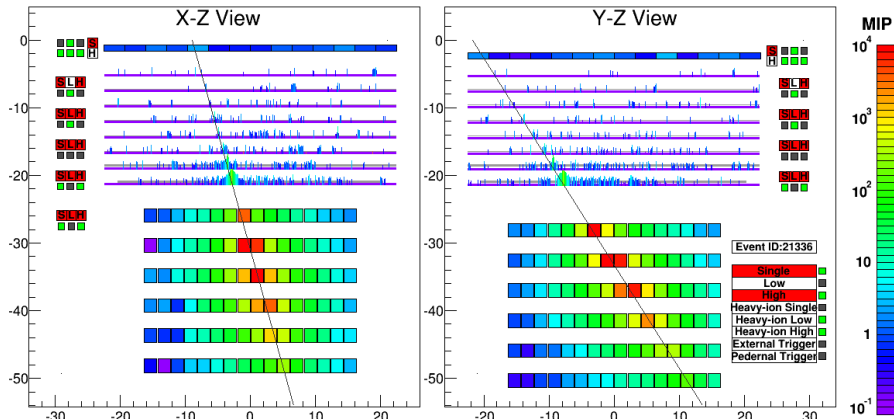

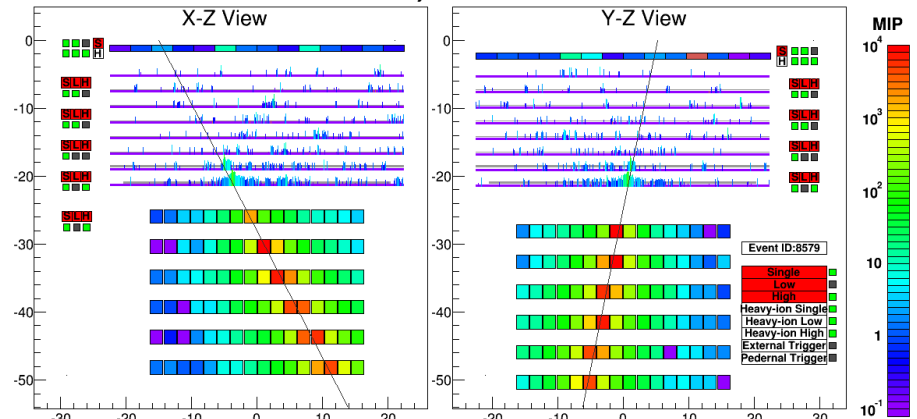

# Event Examples of High-Energy Showers

## Electron, $E=3.05$ TeV

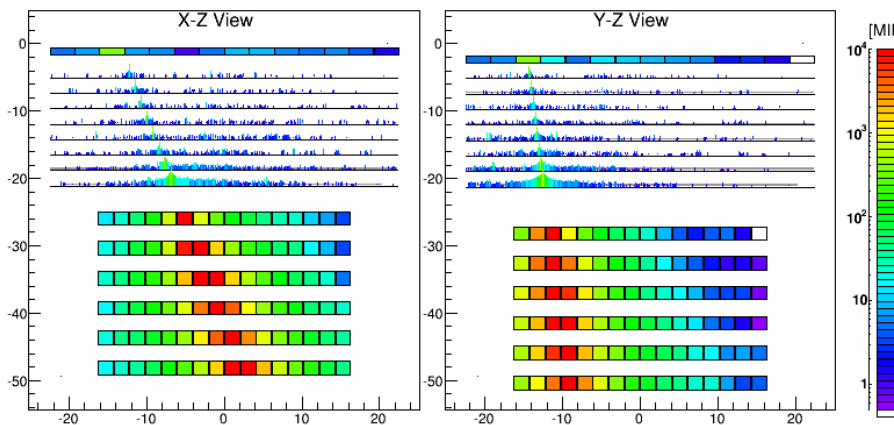

fully contained even at 3TeV

## Proton, $\Delta E=2.89$ TeV

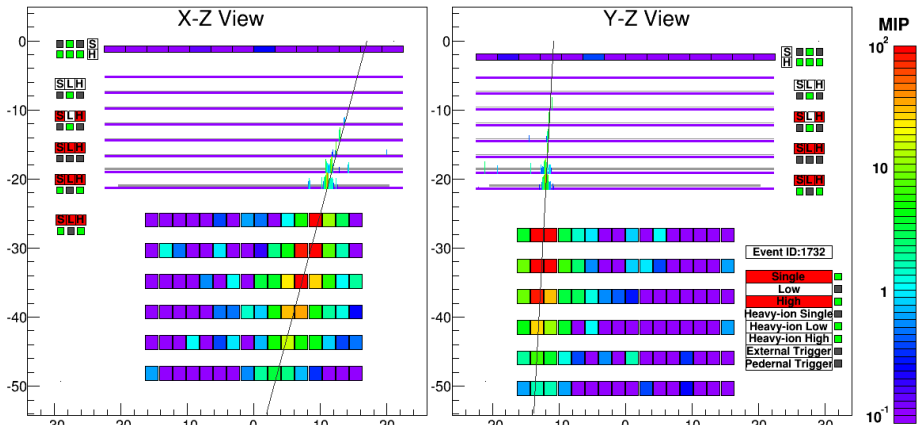

clear difference from electron shower

## Fe( $Z=26$ ), $\Delta E=9.3$ TeV

energy deposit in CHD consistent with Fe

## Gamma-ray, $E=44.3$ GeV

no energy deposit before pair production

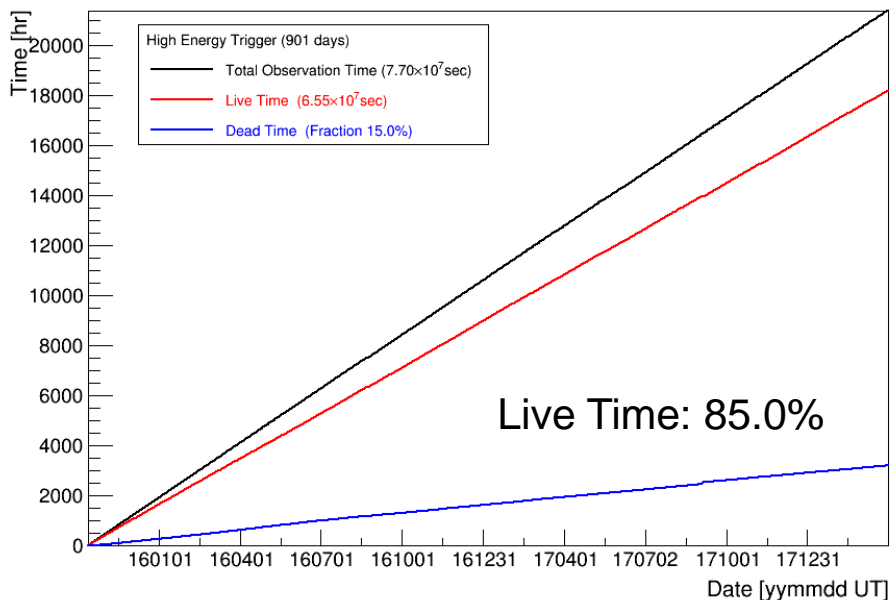

# Observation by High Energy Trigger (>10GeV)

Y.Asaoka, S.Ozawa, S.Torii et al. (CALET Collaboration), Astropart. Phys. 100 (2018) 29.

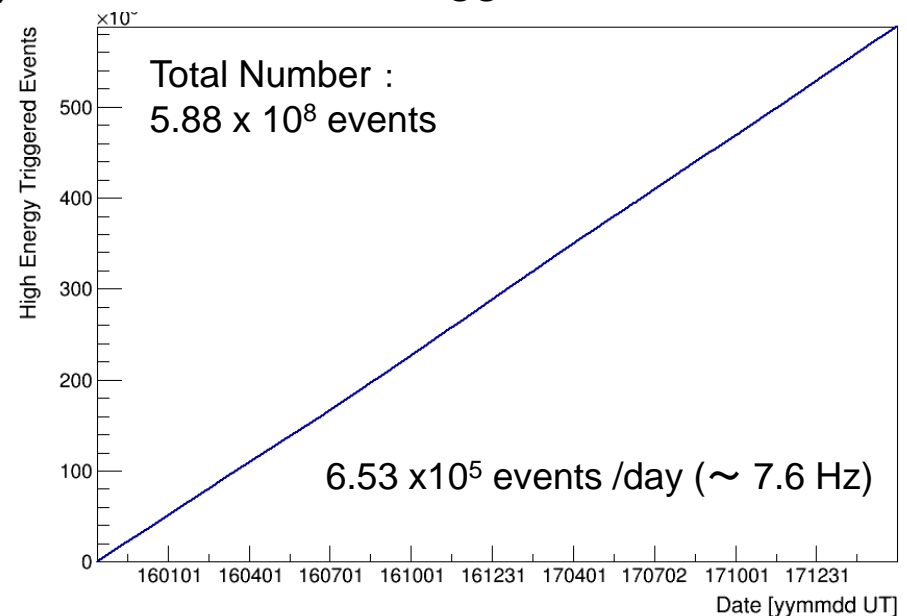

Observation by High Energy Trigger for 901 days : Oct.13, 2015 – Mar. 31, 2018

- ❑ The exposure,  $SQT$ , has reached to  $\sim 78.8 \text{ m}^2 \text{ sr day}$  for electron observations by continuous and stable operations.
- ❑ Total number of the triggered events is  $\sim 590 \text{ million}$  with a live time fraction of 85.0 %.

Accumulated observation time (live, dead)

Accumulated triggered event number

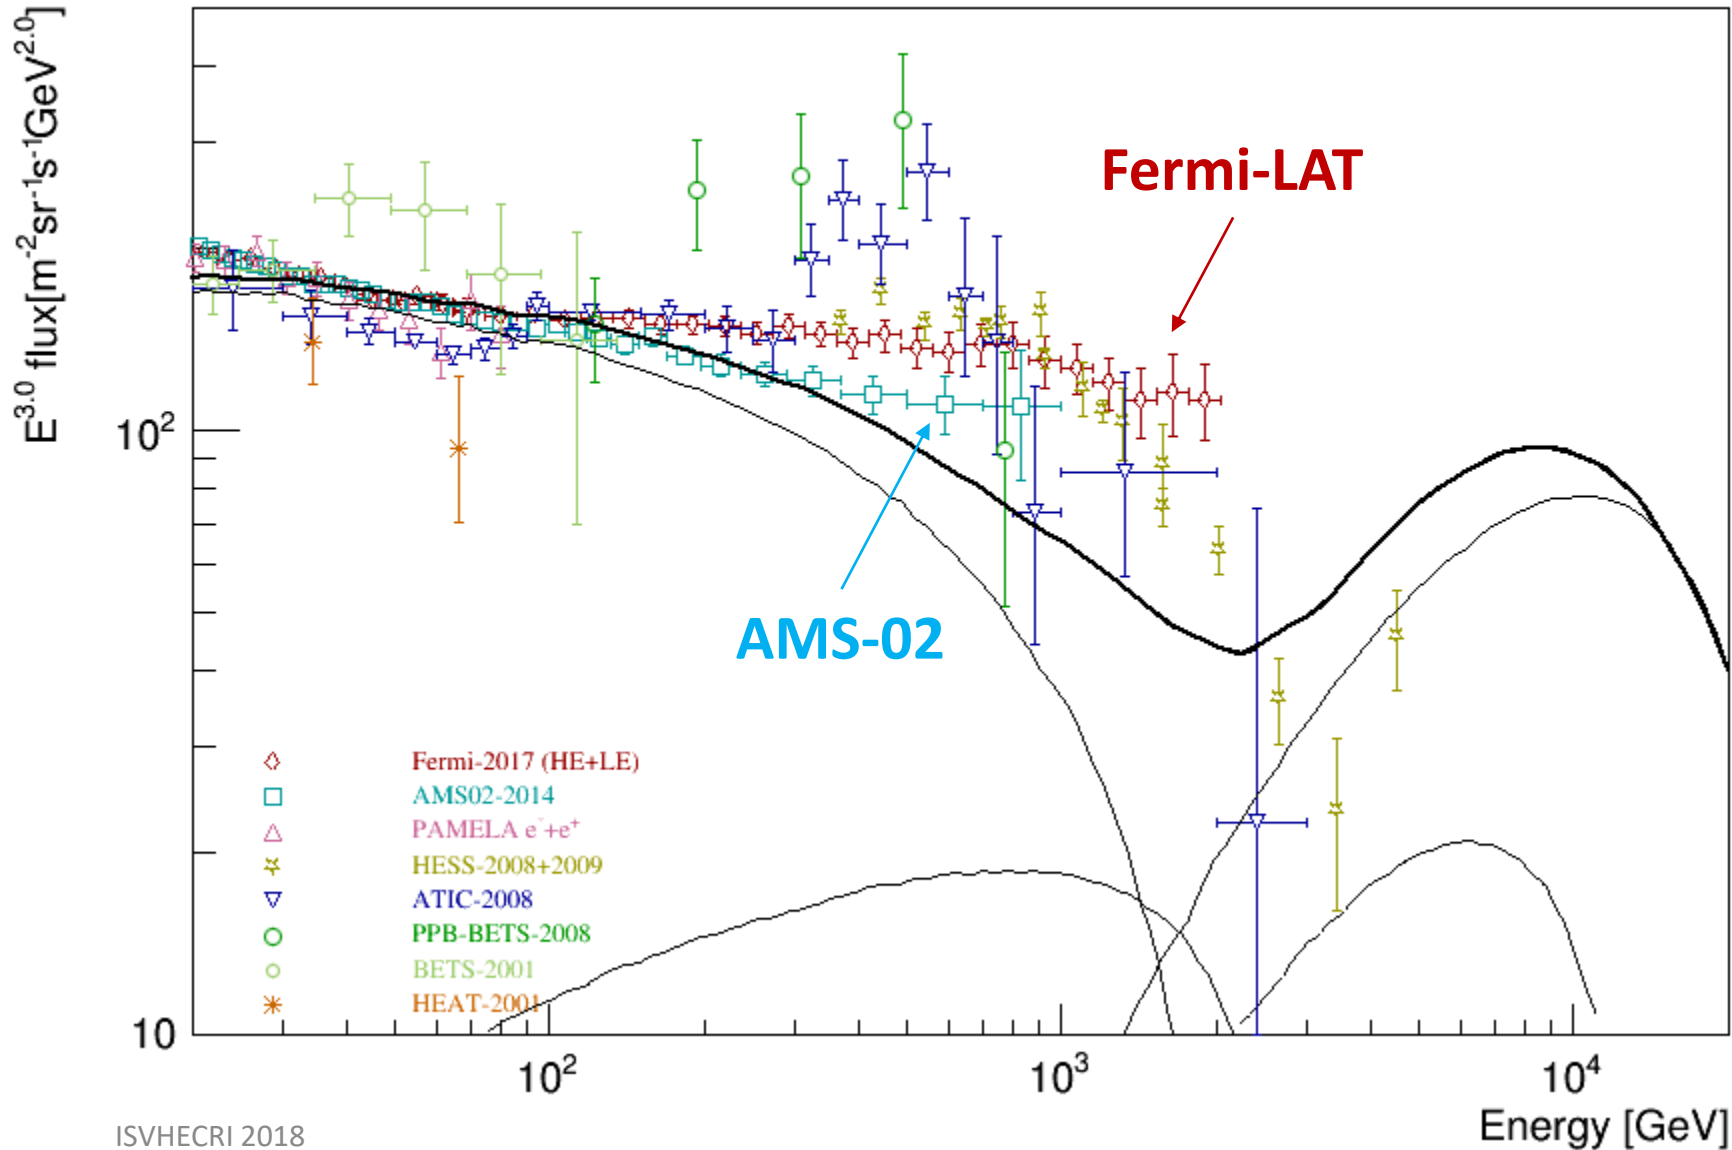

# All-Electron ( $e^+e^-$ )

O.Adriani et al. (CALET collaboration), Phys. Rev. Lett. 119 (2017) 181101

Direct measurements reached 1TeV region.

# Cosmic-Ray All-Electron Spectrum ( $e^+ + e^-$ )

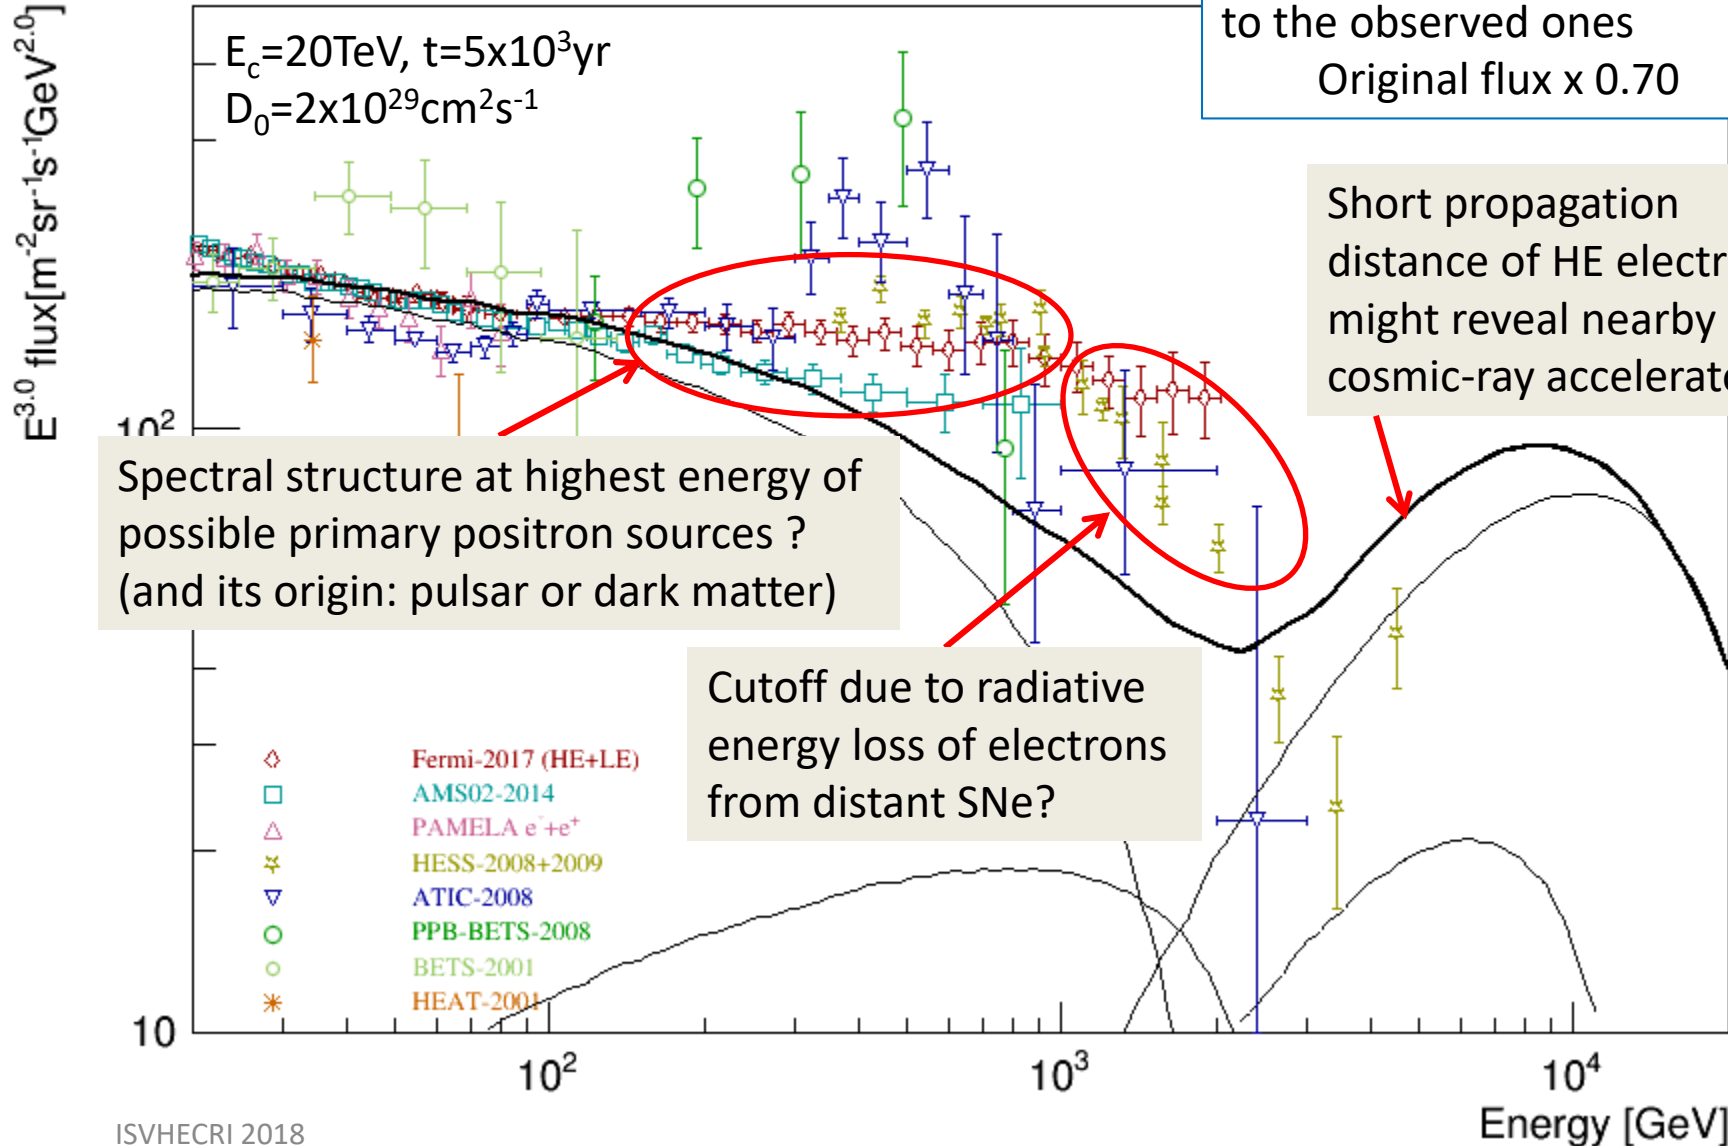

# Cosmic-Ray All-Electron Spectrum ( $e^+ + e^-$ )

Kobayashi et al. ApJ 2004

Calculated results normalized to the observed ones  
Original flux x 0.70

# Cosmic-Ray All-Electron Spectrum ( $e^+ + e^-$ )

Kobayashi et al. ApJ 2004

Calculated results normalized to the observed ones  
Original flux x 0.70

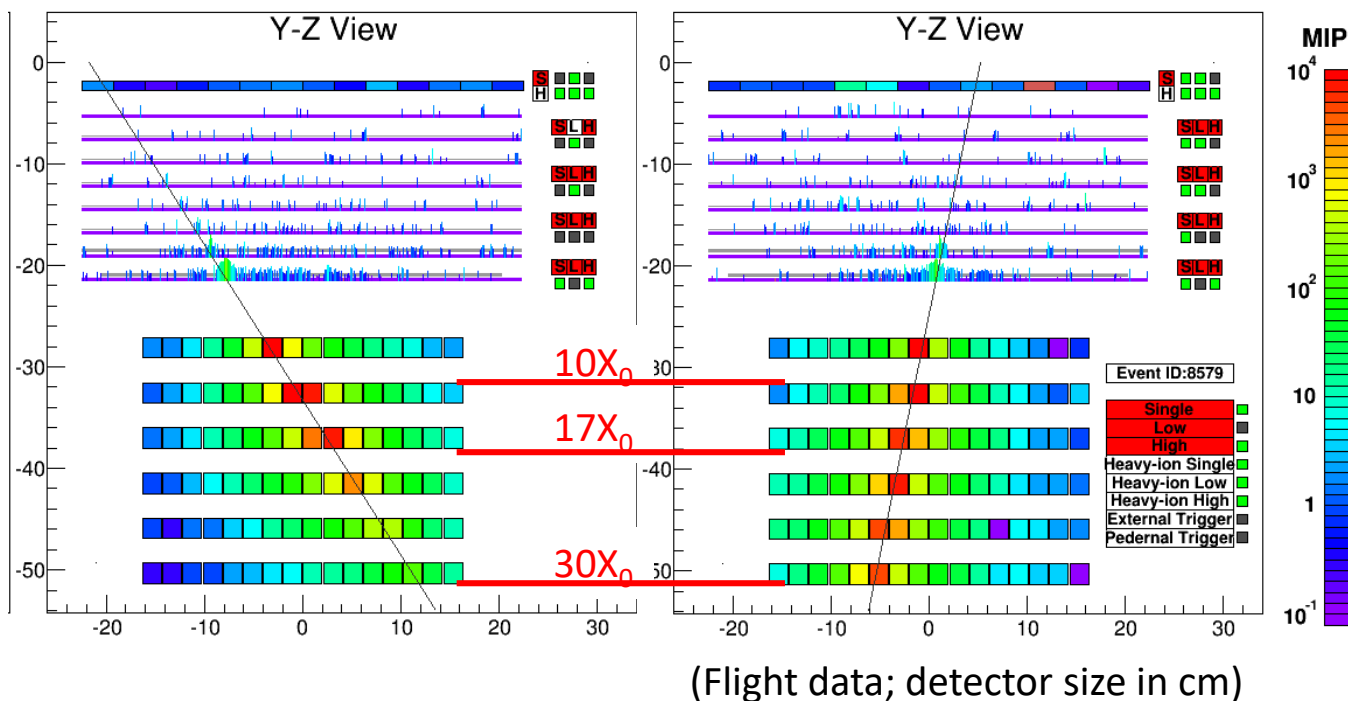

# All-Electron (electron + positron) Analysis

CALET is a dedicated detector for all-electron spectrum measurements.

⇒ CALET is best suited for observation of **possible fine structures** in the all-electron spectrum up to the trans-TeV region.

**3TeV Electron Candidate**

**Corresponding Proton Background**

1. **Reliable tracking**  
well-developed shower core
2. **Fine energy resolution**  
full containment of TeV showers
3. **High-efficiency electron ID**  
30X<sub>0</sub> thickness

# Event Selection

## Analyzed Flight Data:

- 627 days (October 13, 2015 to June 30, 2017)
- 55% of full CALET acceptance (Acceptance A+B;  $570\text{cm}^2\text{sr}$ )

1. Offline Trigger
2. Acceptance Cut
3. Single Charge Selection
4. Track Quality Cut
5. Shower Development Consistency
6. Electron Identification
  1. Simple two parameter cut
  2. Multivariate Analysis using Boosted Decision Trees (BDT)

# Event Selection

## Analyzed Flight Data:

- 627 days (October 13, 2015 to June 30, 2017)
- 55% of full CALET acceptance (Acceptance A+B;  $570\text{cm}^2\text{sr}$ )

1. Offline Trigger
2. Acceptance Cut
3. Single Charge Selection
4. Track Quality Cut
5. Shower Development Consistency
6. Electron Identification
  1. Simple two parameter cut
  2. Multivariate Analysis using Boosted Decision Trees (BDT)

## Pre-selection:

- Select events with successful reconstructions
- Rejecting heavier particles
- Equivalent sample between flight and MC data

# Electron Identification

## Simple Two Parameter Cut

$F_E$ : Energy fraction of the bottom layer sum to the whole energy deposit sum in TASC

$R_E$ : Lateral spread of energy deposit in TASC-X1

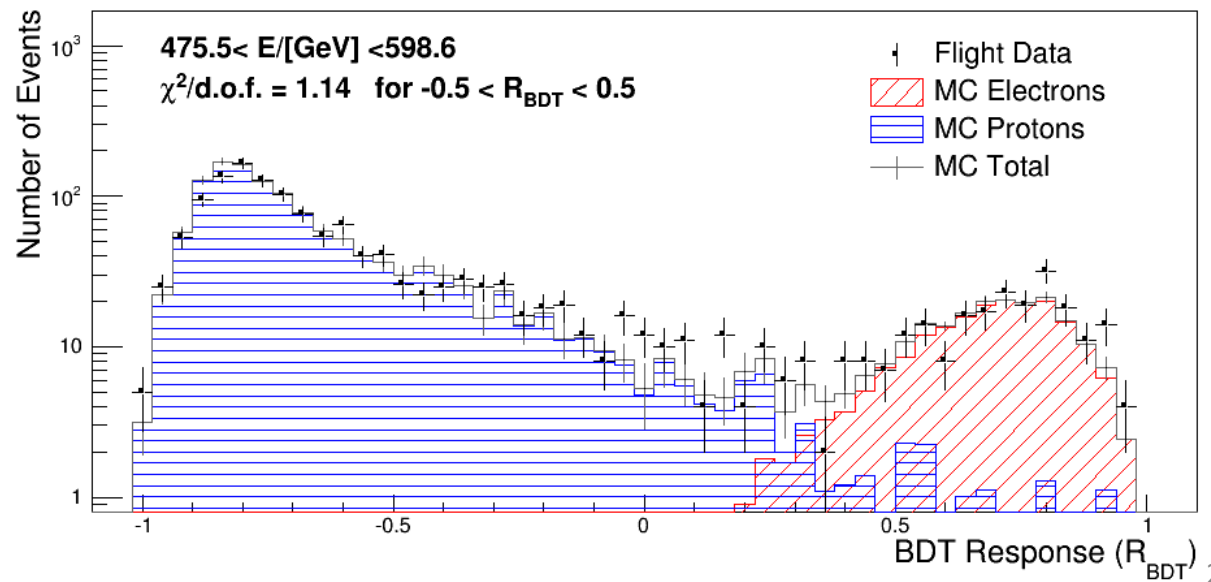

Separation Parameter  $K$  is defined as follows:

$$K = \log_{10}(F_E) + 0.5 R_E \text{ (/cm)}$$

## Boosted Decision Trees

In addition to the two parameters in the left, TASC and IMC shower profile fits are used as discriminating variables.

# Electron Efficiency and Subtraction of Proton Contamination

- Constant and high efficiency is the key point in our analysis.
- Simple two parameter (BDT) cut is used in the energy region  $E < 500 \text{ GeV}$  ( $E > 500 \text{ GeV}$ ) while the difference in resultant spectrum between two methods are taken into account in the systematic uncertainty.
- Contamination is  $\sim 5\%$  up to  $1 \text{ TeV}$ , and  $10 \sim 15\%$  in the  $1 - 3 \text{ TeV}$  region.

# All-Electron Spectrum Measured with CALET from 10 GeV to 3 TeV

CALET: PRL 119 (2017) 181101, 3 November 2017

# All-Electron Spectrum Measured with CALET from 10 GeV to 3 TeV

CALET: PRL 119 (2017) 181101, 3 November 2017

# Systematic Uncertainties

O.Adriani et al. (CALET collaboration), Phys. Rev. Lett. 119 (2017) 181101, Supplement Material

## Stability of resultant flux are analyzed by scanning parameter space

- Normalization:

- Live time
- Radiation environment
- Long-term stability
- Quality cuts

- Energy dependent:

- tracking
- charge ID
- electron ID (K-Cut vs BDT)
- BDT stability (vs efficiency & training)
- MC model (EPICS vs Geant4)

1. Divided into 4 sub-periods (134days each)
2. spectrum in each sub-period is compared with the one from the whole period.
3. standard deviation of the relative difference distribution is taken as systematic uncertainty (1.4%)

# Systematic Uncertainties

O.Adriani et al. (CALET collaboration), Phys. Rev. Lett. 119 (2017) 181101, Supplement Material

# CALET UPPER LIMITS ON X-RAY AND GAMMA-RAY COUNTERPARTS OF GW 151226

Astrophysical Journal Letters 829:L20(5pp), 2016 September 20

The CGBM covered 32.5% and 49.1% of the GW 151226 sky localization probability in the 7 keV - 1 MeV and 40 keV - 20 MeV bands respectively. We place a 90% upper limit of  $2 \times 10^{-7}$  erg  $\text{cm}^{-2} \text{s}^{-1}$  in the 1 - 100 GeV band where CAL reaches 15% of the integrated LIGO probability ( $\sim 1.1$  sr). The CGBM  $7 \sigma$  upper limits are  $1.0 \times 10^{-6}$  erg  $\text{cm}^{-2} \text{s}^{-1}$  (7-500 keV) and  $1.8 \times 10^{-6}$  erg  $\text{cm}^{-2} \text{s}^{-1}$  (50-1000 keV) for one second exposure. Those upper limits correspond to the luminosity of  $3\text{-}5 \times 10^{49}$  erg  $\text{s}^{-1}$  which is significantly lower than typical short GRBs.

CGBM light curve at the moment of the GW151226 event

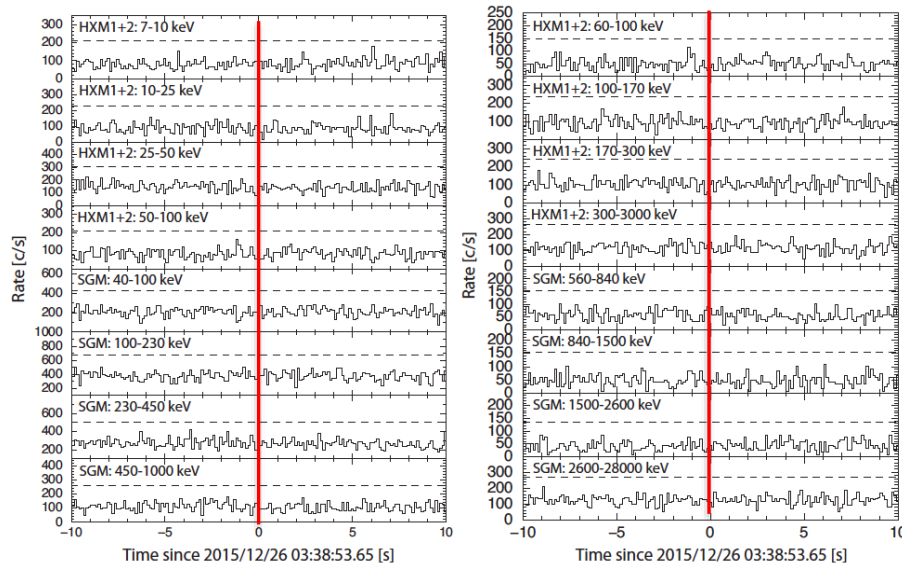

Figure 1. The CGBM light curves in 0.125 s time resolution for the high-gain data (left) and the low-gain data (right). The time is offset from the LIGO trigger time of GW 151226. The dashed-lines correspond to the  $5 \sigma$  level from the mean count rate using the data of  $\pm 10$  s.

Upper limit for gamma-ray burst monitors and Calorimeter

HXM: 7-500 keV

SGM: 50-1000 keV

Figure 2. The sky maps of the  $7 \sigma$  upper limit for HXM (left) and SGM (right). The assumed spectrum for estimating the upper limit is a typical BATSE S-GRBs (see text for details). The energy bands are 7-500 keV for HXM and 50-1000 keV for SGM. The GW 151226 probability map is shown in green contours. The shadow of ISS is shown in black hatches.

Calorimeter: 1-100 GeV

Figure 3. The sky map of the 90% upper limit for CAL in the 1-100 GeV band. A power-law model with a photon index of  $-2$  is used to calculate the upper limit. The GW 151226 probability map is shown in green contours.

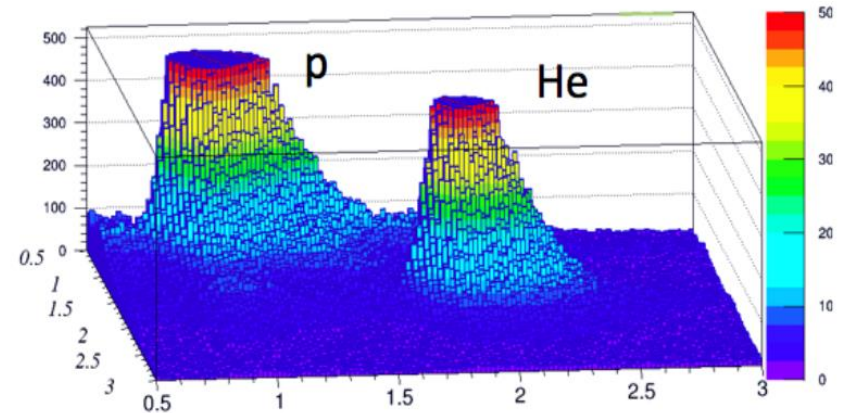

# Preliminary Nuclei Measurements (p, He, $Z \leq 8$ )

P.S.Marrocchesi et al.,  
ICRC 2017, PoS 205.

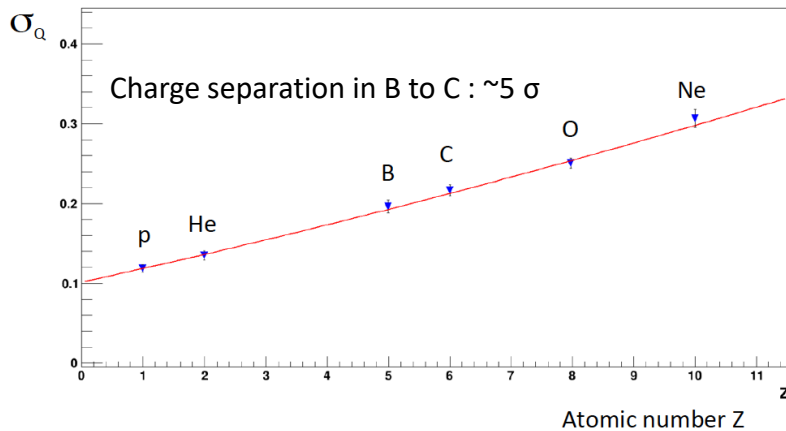

CHD charge resolution (2 layers combined) vs. Z

Charge resolution combined CHD+IMC

Charge resolution using multiple dE/dx measurements from the IMC scintillating fibers

\*) Plots are truncated to clearly present the separation.

Non-linear response to  $Z^2$  is corrected both in CHD and IMC using a model.

A clear separation between p, He, up to  $Z=8$ , can be seen from CHD+IMC data analysis.

Independent analysis is carried out for heavy nuclei in  $Z=8-26$ .

- ❑ Charge determination by CHD together with consistency requirement with IMC
- ❑ Consistent charge resolutions were obtained between the two analysis methods.

Charge distribution with CHD

Analysis Method (in particular for heavy nuclei)

- ❑ Unfolding procedure based on *Bayes' theorem* is applied with response function from MC data.
- ❑ Charge selection efficiencies and contaminations from neighboring charged nuclei are also taken into account in the unfolding procedure.

# Summary and Future Prospects

- CALET was successfully launched on Aug. 19, 2015, and the detector is being very stable for observation since Oct. 13, 2015.
- **As of Mar.31, 2018, total observation time is 901 days with live time fraction to total time to close 85%. Nearly 690 million events are collected with high energy (>10 GeV) trigger.**
- Careful calibrations have been adopted by using “MIP” signals of the non-interacting p & He events, and the linearity in the energy measurements up to  $10^6$  MIPs is established by using observed events.
- **Preliminary analysis of nuclei, all electrons and gamma-rays have successfully been carried out to obtain the energy spectra in the energy range;  
Protons: 55 GeV~22 TeV, Ne-Fe: 500 GeV~70 TeV, All electrons: 10 GeV~3TeV.**
- CALET's CGBM detected nearly 60 GRBs (~20 % short GRB among them ) per year in the energy range of 7keV-20 MeV, as expected. Follow-up observation of the GW events is carried out. ( Not reported in this talk)
- **The so far excellent performance of CALET and the outstanding quality of the data suggest that a 5-year observation period is likely to provide a wealth of new interesting results.**
