Explaining the flavour anomalies with Leptoquarks

Obergurgel, 16.04.2018

- Introduction: The flavour anomalies
 - $b \rightarrow s \mu^+ \mu^-$ Talks of Uli, Regis, Stefano, Vincenzo, ...
 - $b \rightarrow c \tau \nu$
 - Anomalous magnetic moment of the muon a_μ
- Simultaneous explanations with leptoquarks
 - 2 scalar leptoquarks
 - Vector leptoquark; gauged
 - Vector leptoquark; composite
- Conclusions and outlook

- Dark Matter existence established at cosmological scales

Thursday session

- New weakly interacting particles

- Neutrinos not exactly massless

Talk of Frank Deppisch

- Right-handed (sterile) neutrinos

- Matter anti-matter asymmetry

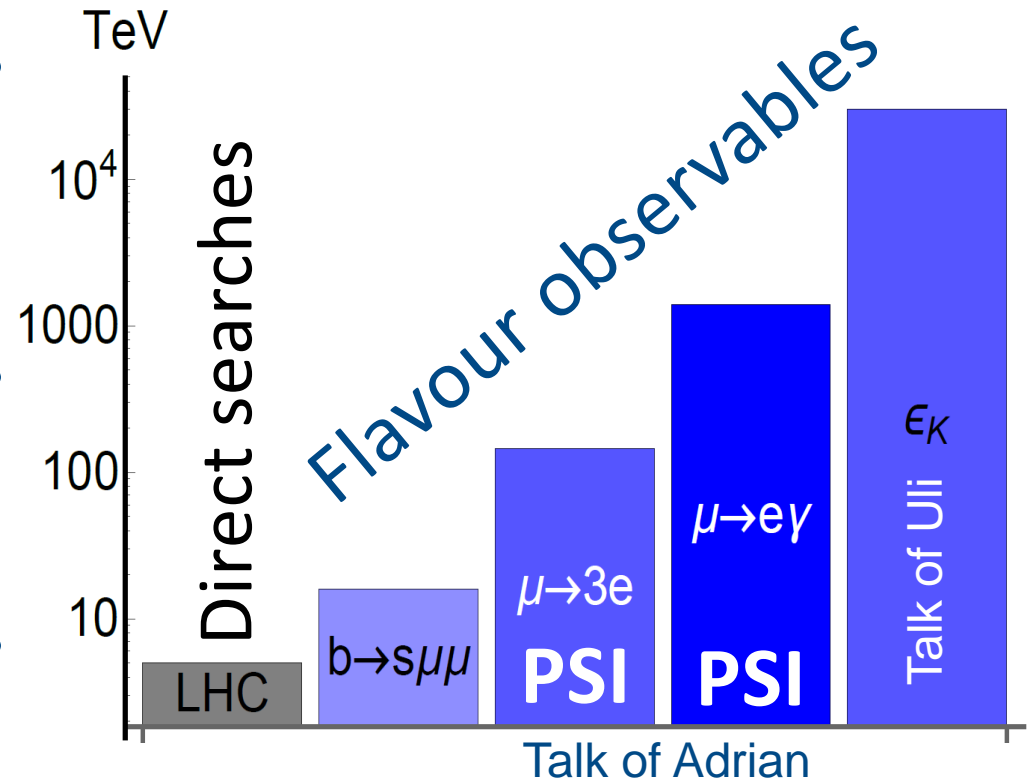

- Additional CP violating interactions

New
particles
and
interactions
exist!

The SM must be extended!
What is the underlying fundamental theory?

Finding New Physics with Flavour

- At colliders one produces many (up to 10^{14}) heavy quarks or leptons and measures their decays into light flavours

Flavour observables are sensitive to higher energy scales than collider searches

2 Accelerators Find Particles That May Break Known Laws of Physics

The LHC and the Belle experiment have found particle decay patterns that violate the Standard Model of particle physics, confirming earlier observations at the BaBar facility

By Clara Moskowitz | September 9, 2015 | [Véalo en español](#)

Democracy suffers a blow—in particle physics

Three independent B-meson experiments suggest that the charged leptons may not be so equal after all.

Steven K. Blau 17 September 2015

Hints for
New Physics
in flavour
observables

- LHCb 3σ deviation from the SM
- Confirmed by BELLE
- 2σ tension in the $B_s \rightarrow \phi \mu \mu$ branching ratio

Hadronic uncertainties or NP?

$R(K) = B \rightarrow K \mu \mu / B \rightarrow K e e$

- Lepton flavour universality violation
- 2.6σ deviation from the theoretically rather clean SM expectation

C. Bobeth, G. Hiller, and
G. Piranishvili, 0709.4174

$$R_K^{\text{SM}} = 1.0003 \pm 0.0001$$

$$R_K^{\text{exp}} = 0.745_{-0.074}^{+0.090} \pm 0.036$$

Lepton Flavour
Violation in
B decays?

$$R(K^*) = \mathcal{B} \rightarrow K^* \mu\mu / \mathcal{B} \rightarrow K^* ee$$

■ 2.2-2.4 σ in two bins

- Global analyses give a very good fit to data

- Good fit to data:

- C_9
- $C_9 = -C_{10}$
- $C_9 = -C'_9$

$$O_9 = \bar{s} \gamma^\mu P_L b \bar{l} \gamma_\mu l$$

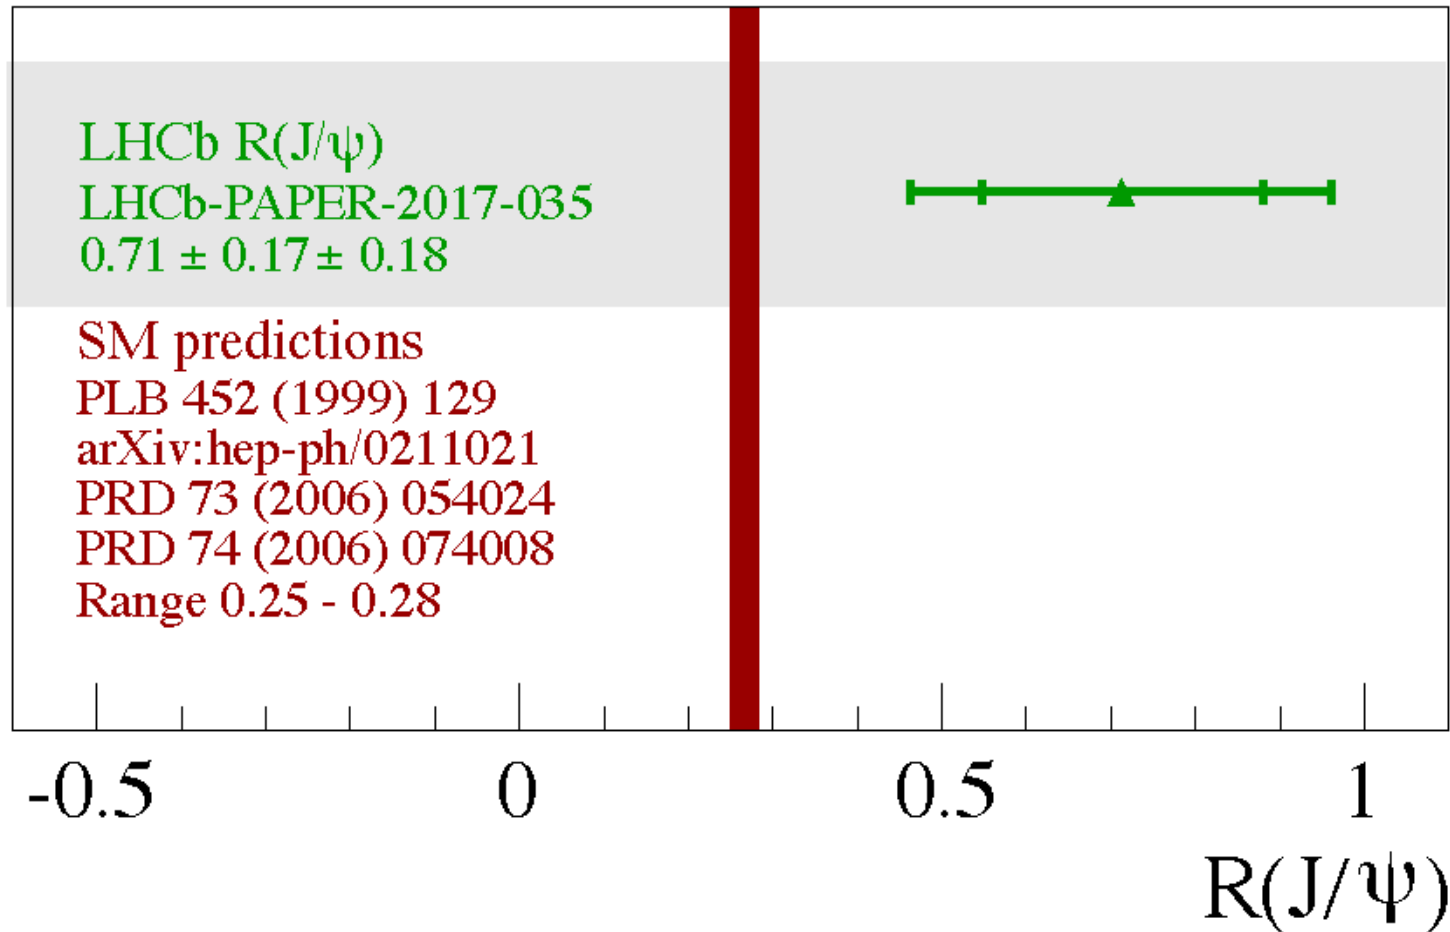

$$O_{10} = \bar{s} \gamma^\mu P_L b \bar{l} \gamma_\mu \gamma^5 l$$

B. Capdevila, AC, S. Descotes-Genon, J. Matias and J. Virto, arXiv:1704.05340 [hep-ph].

Fit is 5-6 σ better than the SM

$b \rightarrow c\tau\nu$ processes

All measurements above the SM prediction
 $\approx 4\sigma$ deviation

- Single measurement from BNL
- Theory prediction sound but challenging because of hadronic effects.

$$\Delta a_{\mu} = (236 \pm 87) \times 10^{-11}$$

- Soon new experimental results from Fermilab

3 σ deviation (order of SM-EW contribution)

- Scalars or Vectors
- 5 gauge representations each which are invariant under the SM gauge group
- Couple quarks to leptons
- Maybe also quarks to quarks
 - Proton decay
- Are present in Grand Unified Theories

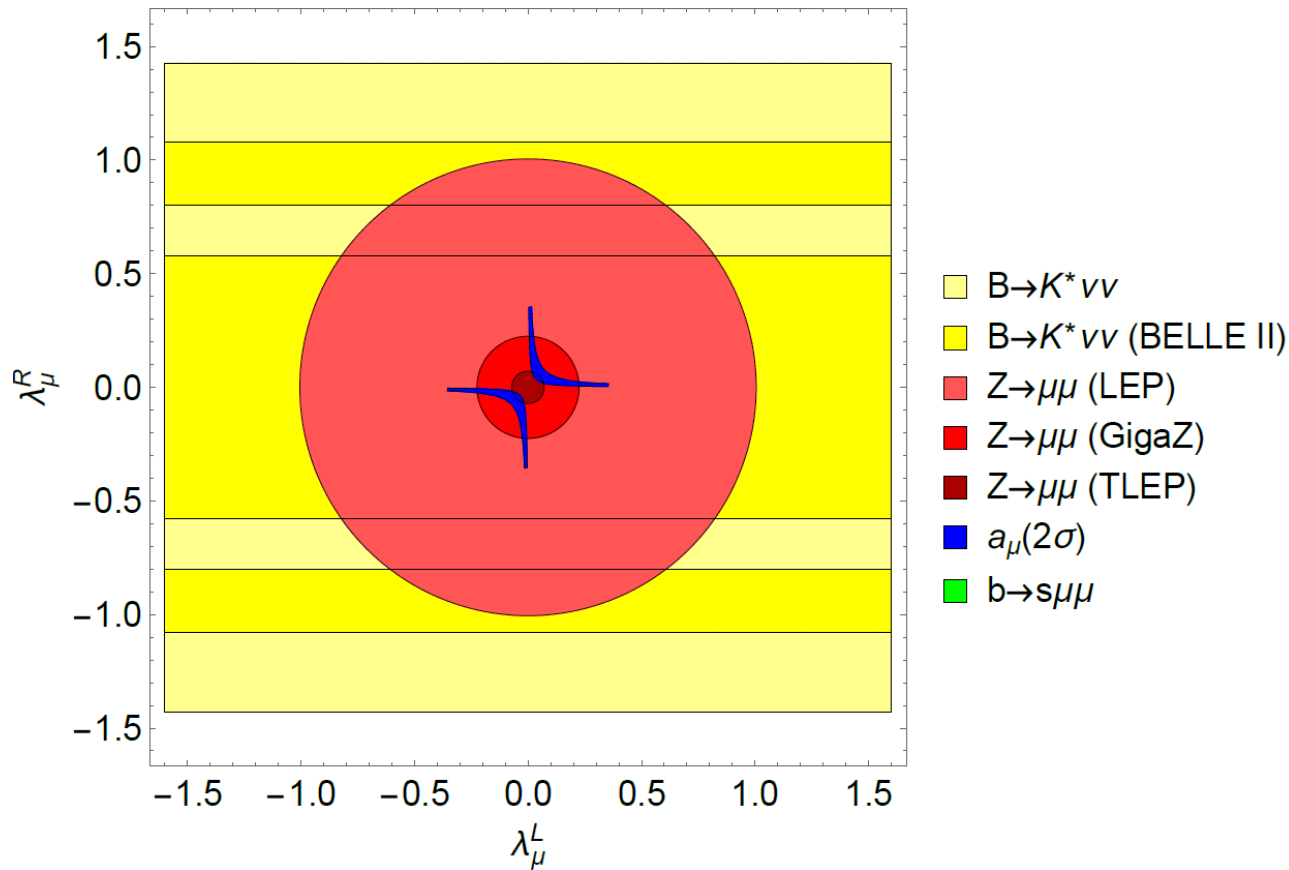

a_μ : Leptoquarks

m_t/m_μ enhancement

■ Chirally enhanced effects via top-loops

$\lambda_\mu^{L,R}$

Left-, right-
handed
muons-top
coupling

E. Leskow, A.C.,
G. D'Ambrosio,
D. Müller
arXiv:1612.06858

$Z \rightarrow \mu \mu$ at future colliders

R(K), R(K*) and $\mu \rightarrow e\gamma$ with LQs

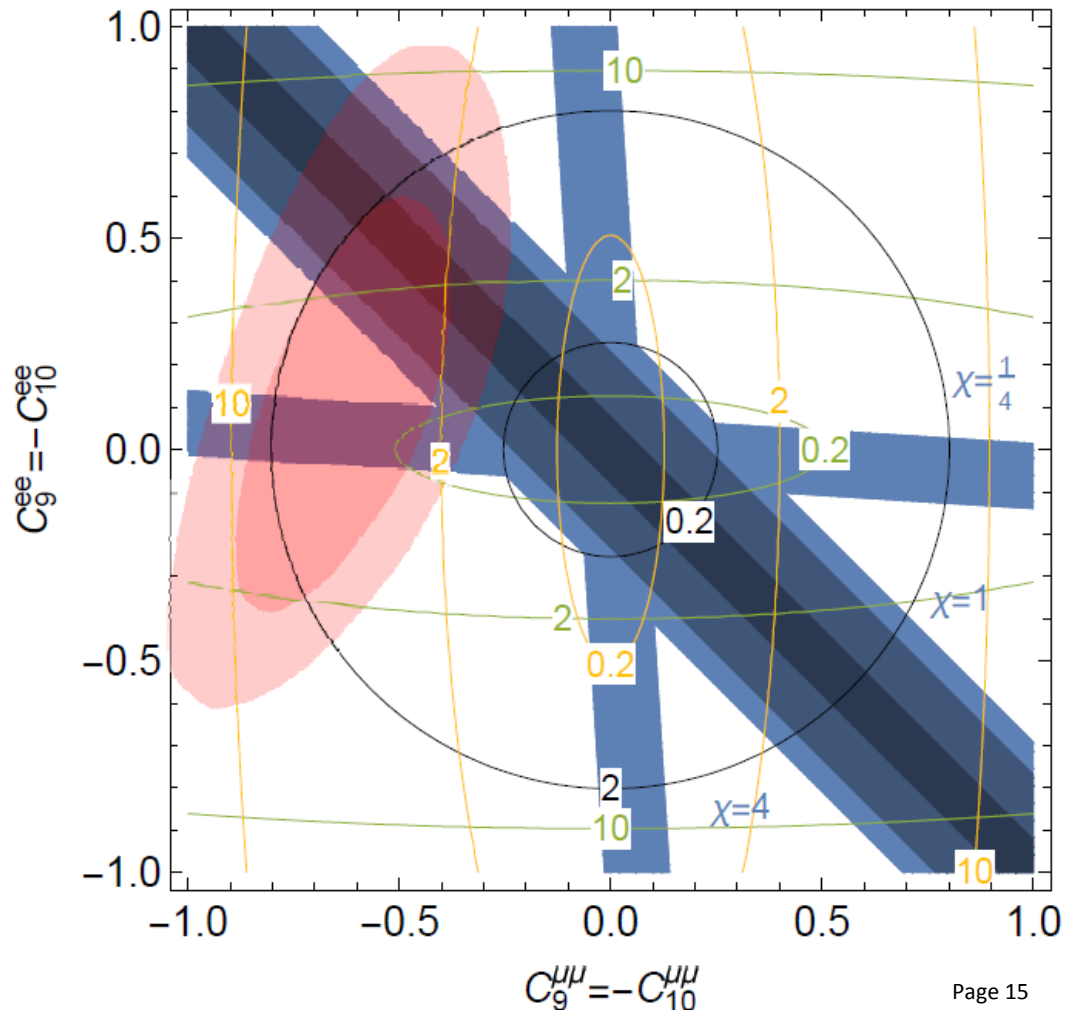

■ Three LQs give a good fit

- Scalar triplet
- Vector singlet
- Vector triplet

$b \rightarrow s\mu\mu$
& $b \rightarrow see$
generate
 $\mu \rightarrow e\gamma$

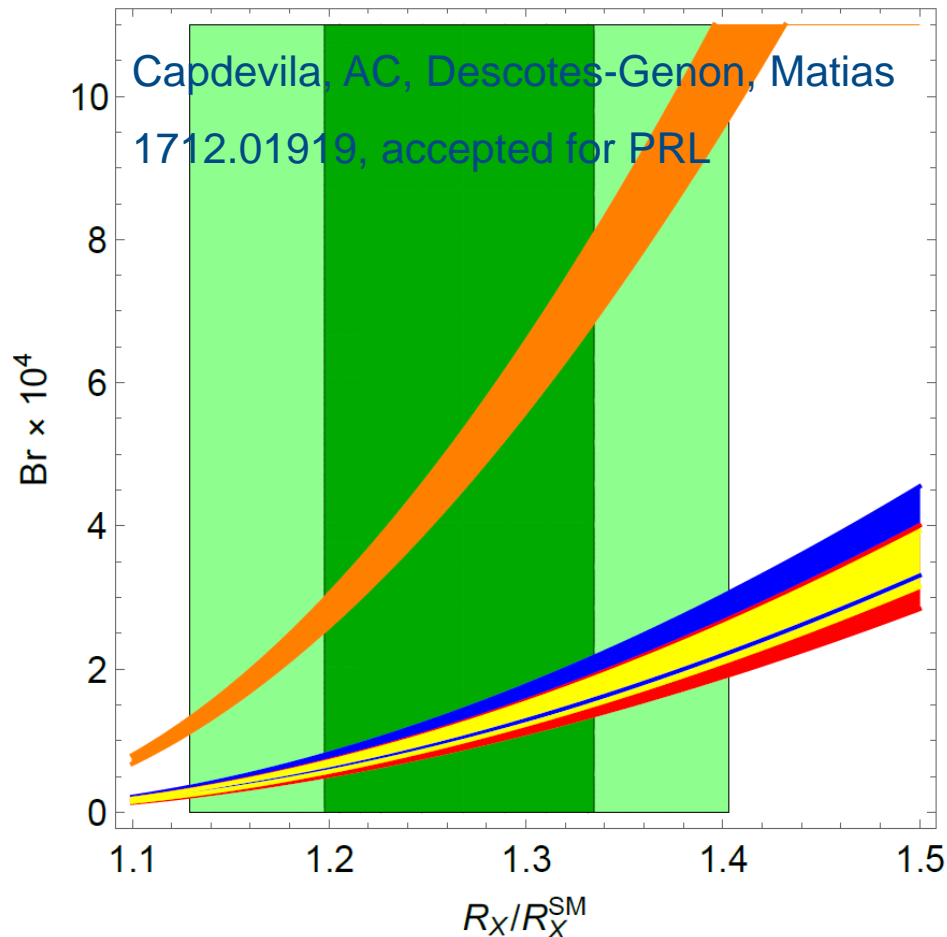

AC, D. Mueller, A. Signer, Y. Ulrich,
arXiv:1706.08511

- $\text{Br}[\mu \rightarrow e\gamma] < 4.2 \cdot 10^{-13}$
- $b \rightarrow s\mu\mu$ (1σ)
- $b \rightarrow s\mu\mu$ (2σ)
- $10^8 \cdot \text{Br}[B \rightarrow K \mu e]$ with $\gamma=1/2$
- $10^8 \cdot \text{Br}[B \rightarrow K \mu e]$ with $\gamma=1$
- $10^8 \cdot \text{Br}[B \rightarrow K \mu e]$ with $\gamma=2$

$R(D^{(*)})$ and $b \rightarrow s\tau\tau$

- Large couplings to the second generation
- Cancellation in $b \rightarrow svv$ needed: $C^{(1)}=C^{(3)}$

$b \rightarrow s\tau\tau$
very
strongly
enhanced

See also R. Alonso, B. Grinstein
and J. Martin Camalich, 1505.05164

Two Scalar Leptoquarks for $b \rightarrow c\tau\nu$

- Φ_1 scalar leptoquark singlet with $Y=-2/3$
- Φ_3 scalar leptoquark triplet with $Y=-2/3$

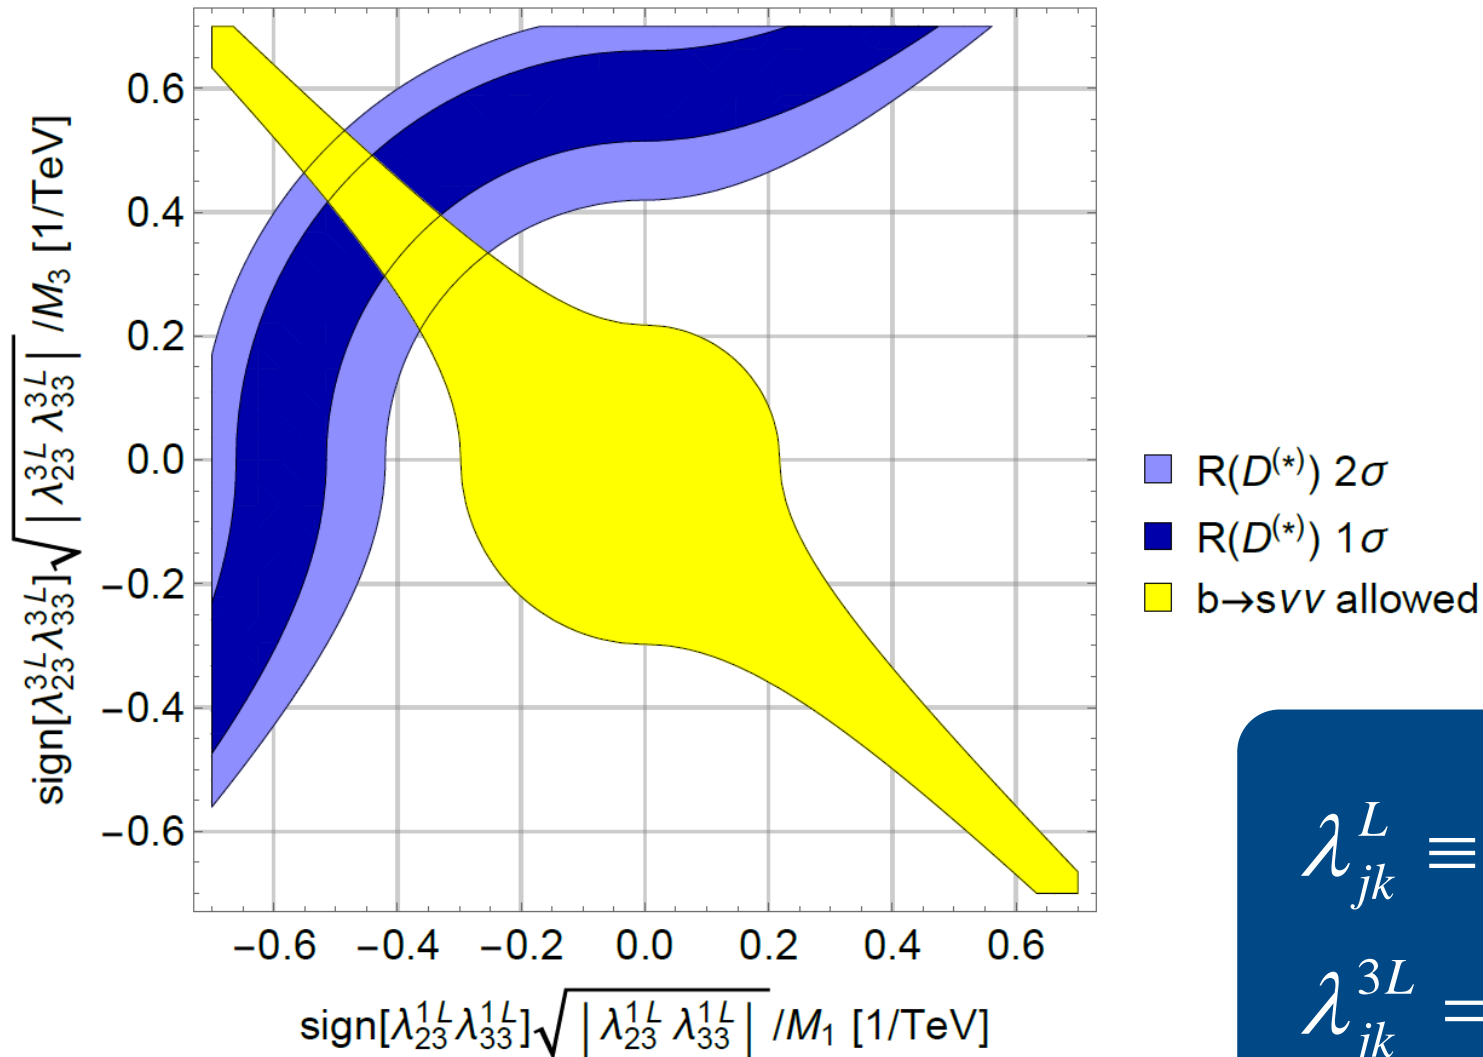

AC, D. Mueller,
T. Ota
arxiv:1703.09226

Constructive in $R(D^{(*)})$

Destructive in $b \rightarrow s\nu\nu$

$R(D^{(*)})$, $b \rightarrow svv$ with 2 Scalar LQs

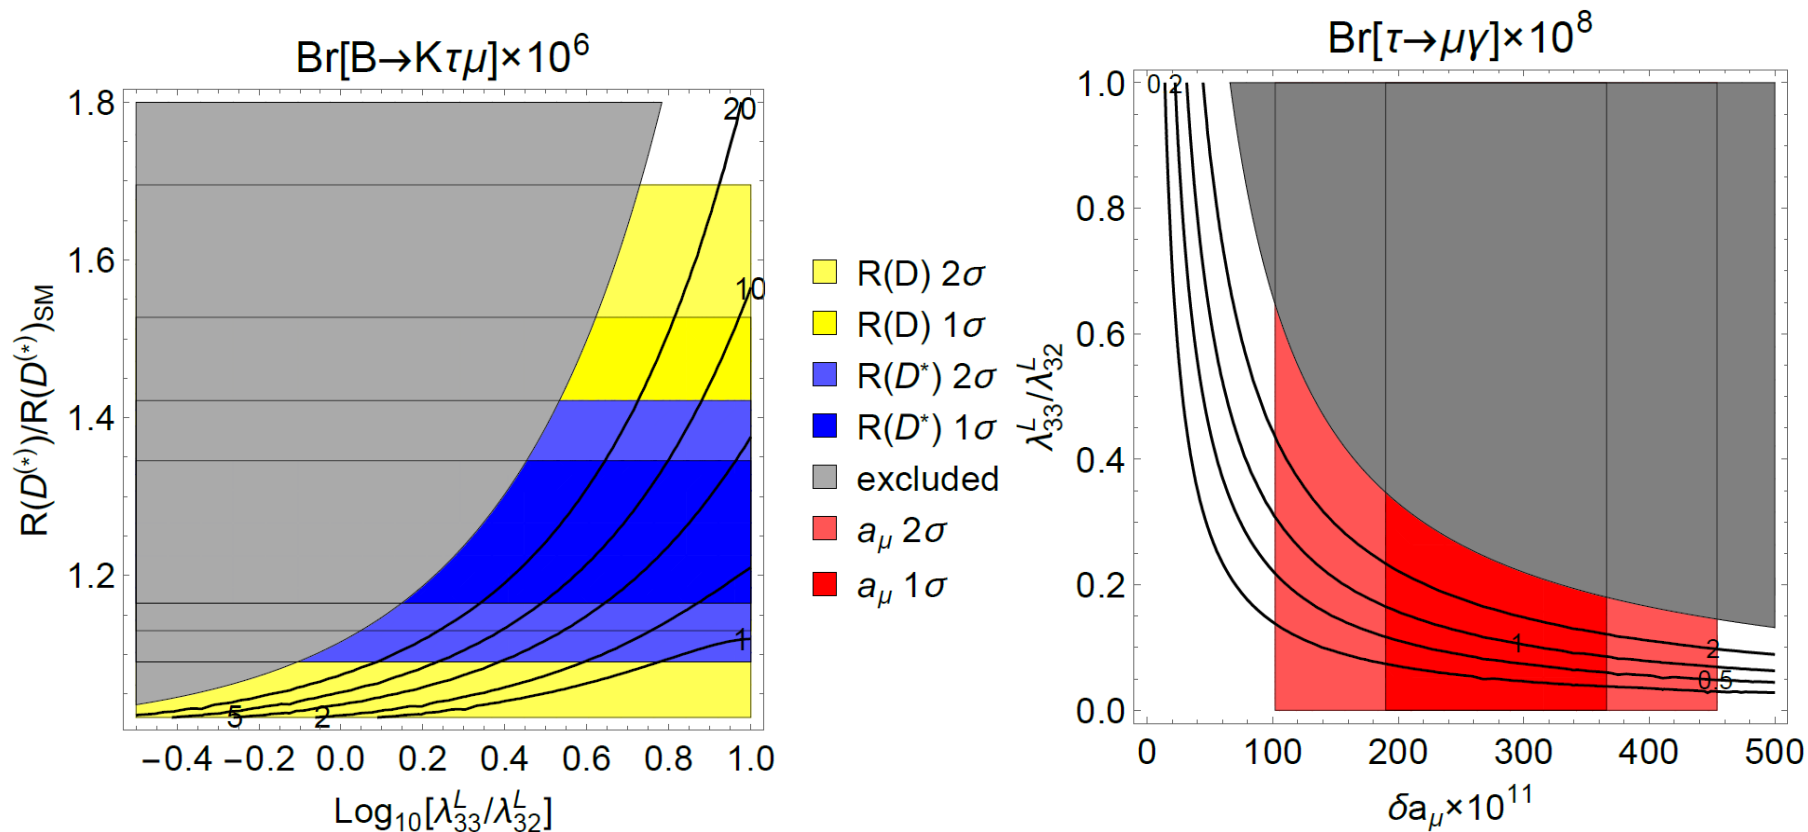

$$\lambda_{jk}^L \equiv \lambda_{jk}^{1L}$$

$$\lambda_{jk}^{3L} = e^{i\pi j} \lambda_{jk}^L$$

$R(D^{(*)})$, $b \rightarrow s \mu \mu$ and a_μ with 2 scalar LQs

- Scalar leptoquark singlet + triplet with $Y = -2/3$
- Cancellation in $b \rightarrow s \nu \nu$ imposed

2 out of 3 can be explained

- $C_9 = -C_{10}$ effect in $b \rightarrow s \mu \mu$
- Left handed vector current in $R(D)$ and $R(D^*)$
- No effect in $b \rightarrow s \nu \nu$
- No proton decay
- Contained within the Pati-Salam model
- Massive vector bosons
 - Non-renormalizable without Higgs mechanism
 - Pati Salam not possible at the TeV scale because of $K_L \rightarrow \mu e$ and $K \rightarrow \pi \mu e$

Good solution, but difficult UV completion

	$SU(4)$	$SU(2)_L$	$SU(2)_R$	$U(1)_{PQ}$
X_i^L	4	2	1	0
Y_i^L	4	2	1	0
Y_i^R	4	2	1	1
X_i^R	4	1	2	0
Z_i^R	4	1	2	0
Z_i^L	4	1	2	1
Σ	$\bar{4} \otimes 4$	1	1	-1

L. Calibbi, AC and T. Li,

A model of vector leptoquarks in view of the B-physics anomalies

arXiv:1709.00692

$$Y_R = \begin{pmatrix} Q'_R \\ L'_R \end{pmatrix}_i, \quad Y_L = \begin{pmatrix} Q_L \\ 1_L \end{pmatrix}_i, \quad X_L = \begin{pmatrix} q_L \\ L_L \end{pmatrix}_i$$

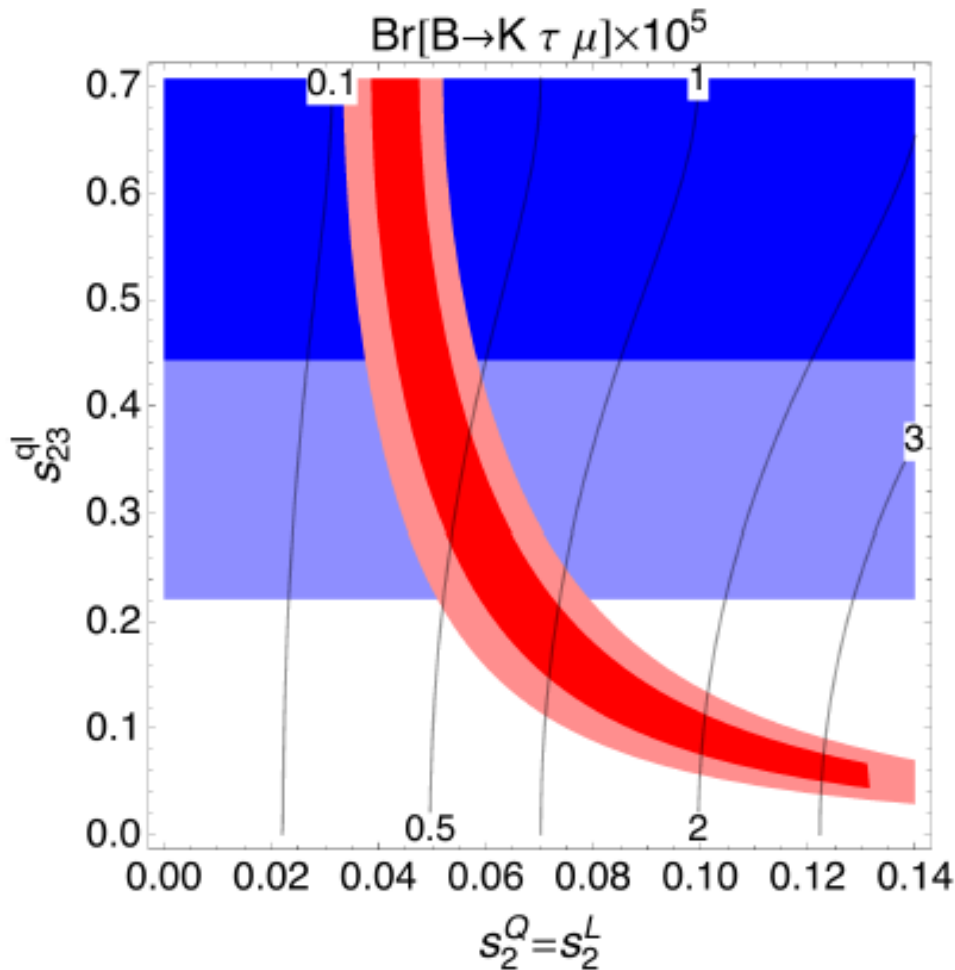

$$L \supset - \left(m_{ij}^Q \bar{q}_{iL} + M_{ij}^Q \bar{Q}_{iL} \right) Q'_{jR} - \left(M_{ij}^L \bar{L}_{iL} + m_{ij}^L \bar{1}_{iL} \right) L'_{jR}$$

- 3 light generation (SM fermions)
- 3 heavy generation (vector like)

Only the LQ couples flavour violating

R(D^(*)) and b → s μ μ

$$s_3^Q = s_3^L = \frac{1}{\sqrt{2}}$$

$$M = 1.5 \text{ TeV}$$

$$s_i^Q = \frac{\frac{m_{ii}^Q}{M_{ii}^Q}}{\sqrt{1 + \frac{m_{ii}^Q}{M_{ii}^Q}}}$$

- R(D^(*)) 2σ
- R(D^(*)) 1σ
- C₉^{μμ} = -C₁₀^{μμ} 2σ
- C₉^{μμ} = -C₁₀^{μμ} 1σ

LHCb bounds require additional heavy neutral fermions

Simultaneous explanation possible!
Can also account for the AMM of the muon

M. Blanke, AC, arXiv:1801.07256

- $SU(4) \otimes SU(2)_L \otimes SU(2)_R$ broken to the SM via boundary conditions on a compact extra dimension
- Zero modes: SM fermions
- KK modes: Vector-like fermions and massive gauge bosons
- No zero mode for the Leptoquark
- Flavour alignment to the down-sector

PS + RS naturally accounts for a vector LQ + VLFs

- $b \rightarrow c\tau\nu$

- $b \rightarrow s\mu\mu$

- $\tau \rightarrow \mu\mu\mu$ & D mixing

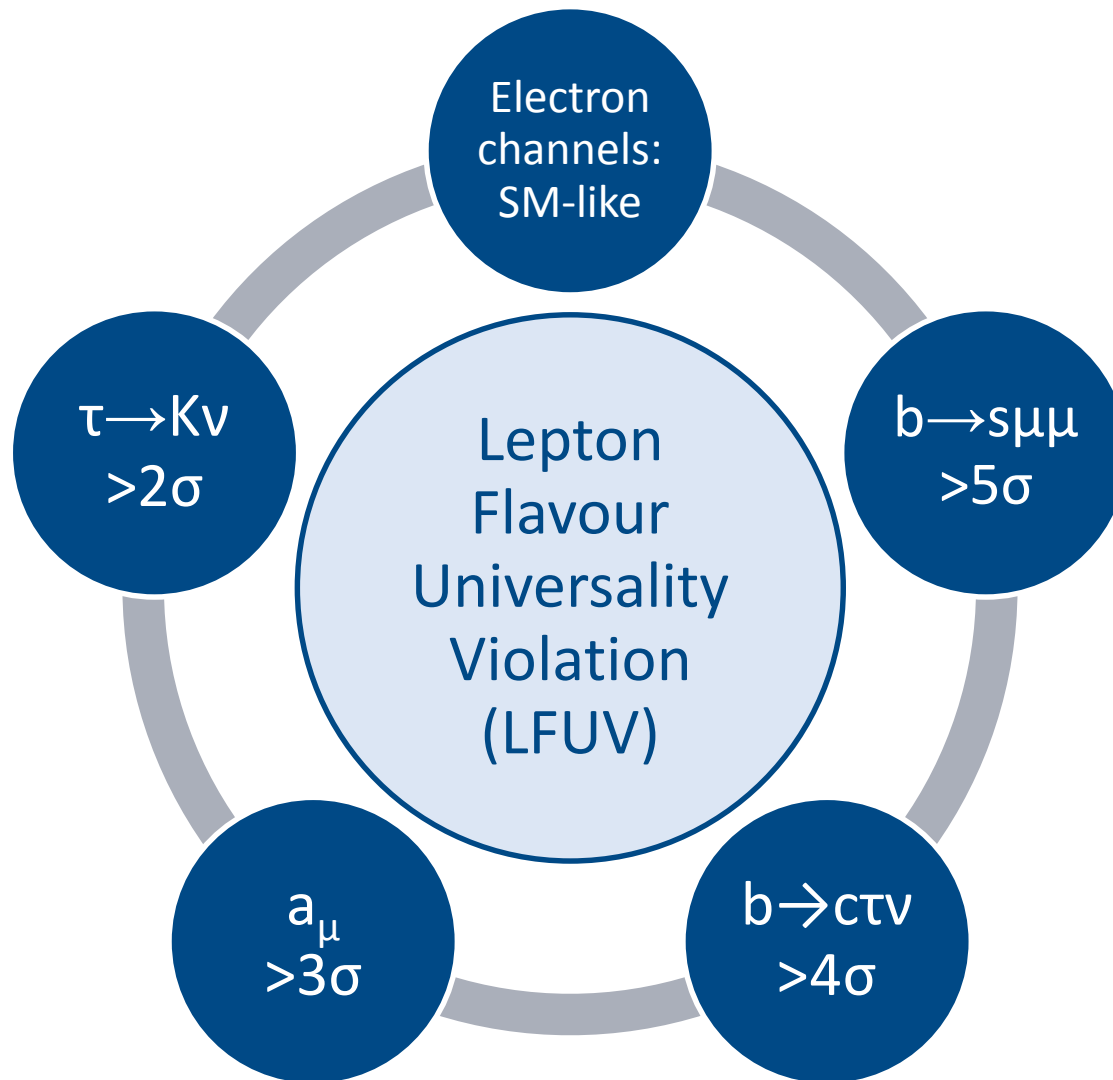

D mixing $\tau \rightarrow \mu\mu\mu$ and cannot be avoided

Modell well motivated + limited but sizable effect

- P5'  $b \rightarrow d\mu\mu$
- R(D) & R(D*)  $b \rightarrow s\tau\tau$
- R(K) & R(K*)  $\mu \rightarrow e\gamma$
- R(D), R(D*) & a_μ  $\tau \rightarrow \mu\gamma$
- R(D), R(D*) & $b \rightarrow s\mu\mu$  $b \rightarrow s\tau\mu$

Interesting experimental prospects

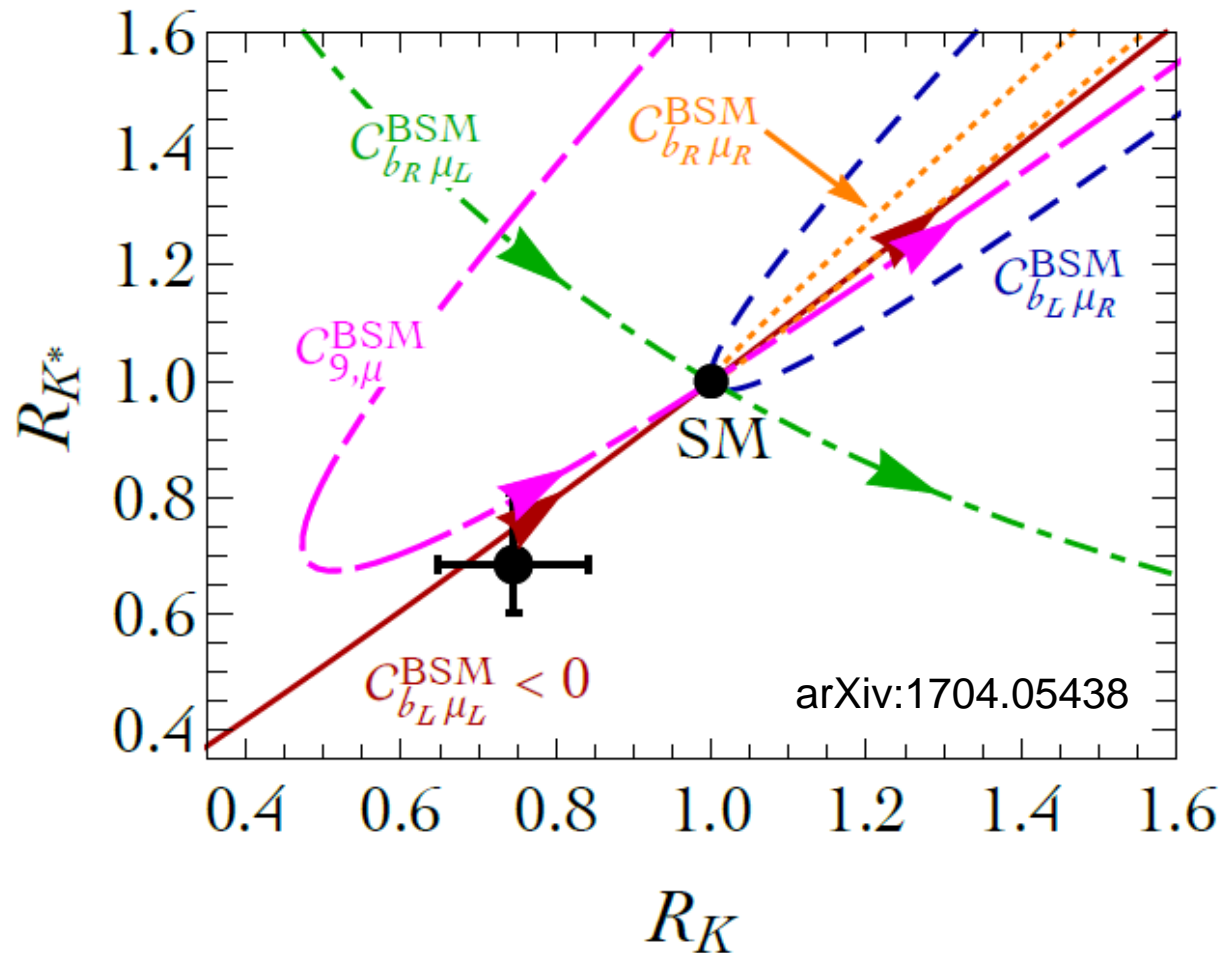

Leptoquarks provide a very promising solution to the flavour anomalies
