# 2 Higgs-Doublet Model with Pseudoscalar Dark Matter Mediator

## 2 Higgs-Doublet Model (2HDM) ....

- SM has only one Higgs doublet
- 5 proper bosons
  - SM like scalar boson:  $h$
  - heavy neutral scalar:  $H$
  - heavy charged scalars:  $H^{\pm}$
  - pseudoscalar  $A_0$ 
    - couples to SM particles

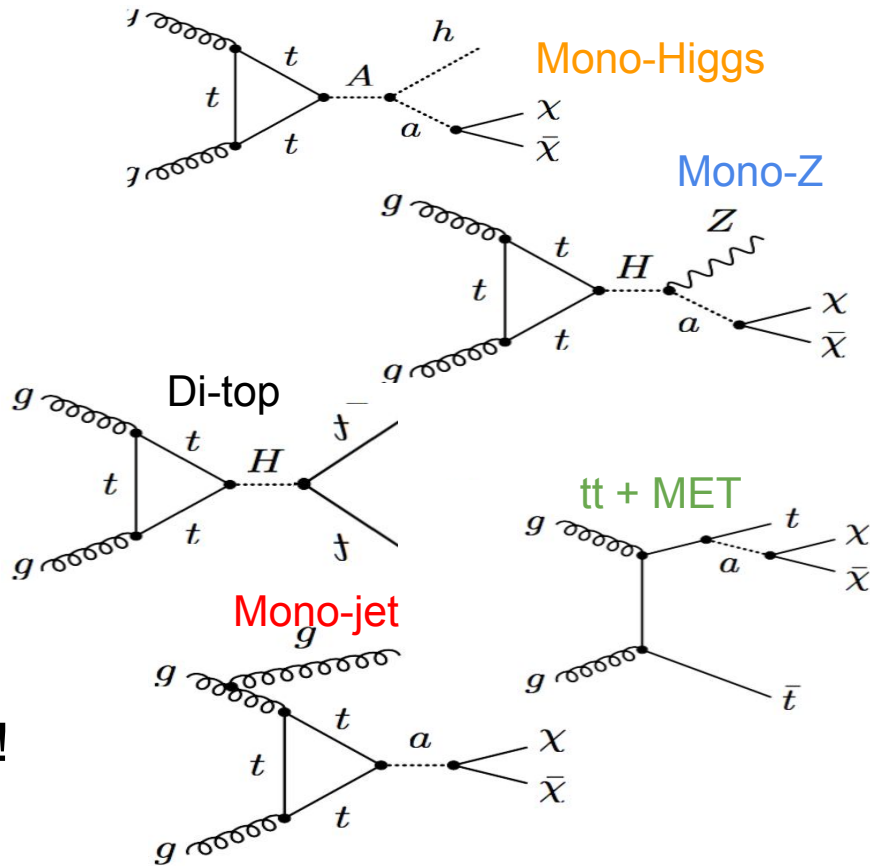

## .... with Dark Matter Mediator (+a)

- pseudoscalar  $a_0$ 
  - couples to fermionic Dark Matter (DM) particle
- $a_0$  and  $A_0$  mix into mass-eigenstates  $a$  and  $A$
- After mixing:
  - 2 pseudoscalars:  $a$  and  $A$
  - both couple to DM
  - both couple to SM particles

<https://arxiv.org/abs/1701.07427>

# 2HDM+a: Diverse palette of signatures

The interplay is experimentally exciting!

# 2HDM+a Parameters

- 2HDM + pseudoscalar DM-mediators  $a, A$
- parameters of interest:

- $m_a, m_A$  : DM mediator masses

*dominate mono-h  
kinematics*

- $m_H = m_{H^{\pm}}$  : heavy neutral (charged) scalar mass

- $\tan(\beta)$  : ratio of vacuum expectation values

- $\sin(\theta)$  :  $a$ - $A$  mixing angle

- $\lambda_3, \lambda_{P1}, \lambda_{P2}$  : quartic scalar couplings

- $y_X$  : DM Yukawa-coupling to  $a$  and  $A$

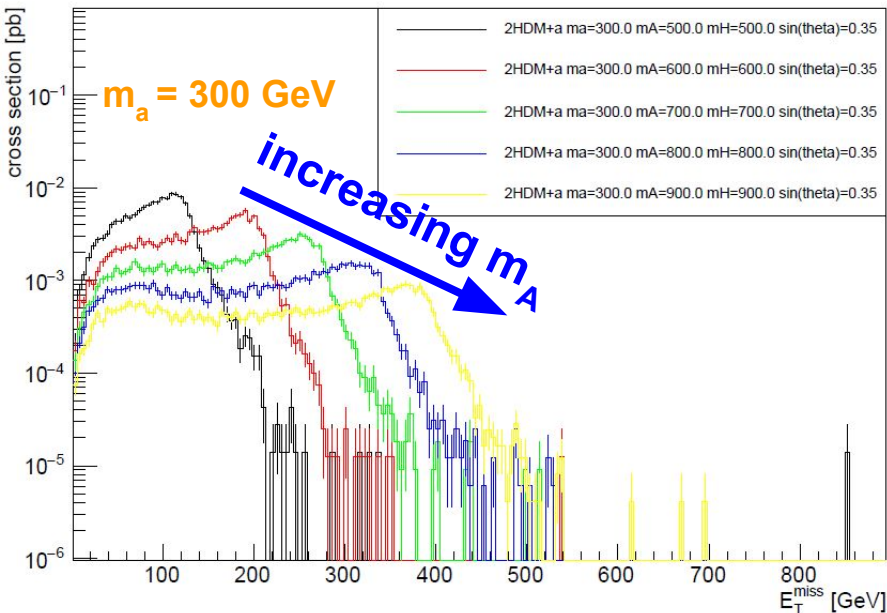

- $m_X$  : DM particle mass

*influence mono-h  
kinematics*

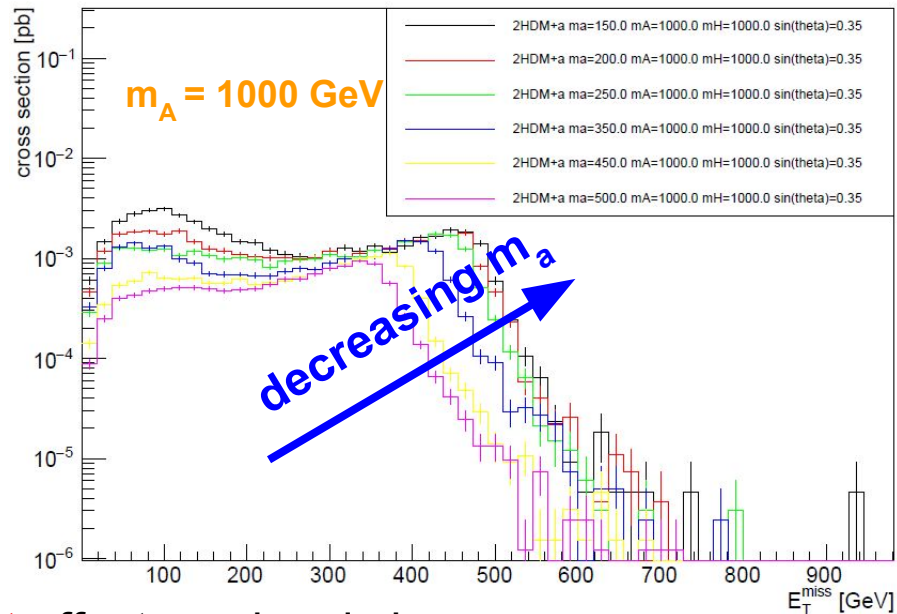

*change mono-h  
cross-sections*

# mono-h: Signal Kinematics

2HDM+a  $m_a=300.0$   $m_A=500.0-900.0$   $m_H=500.0-900.0$   $\sin(\theta)=0.35$

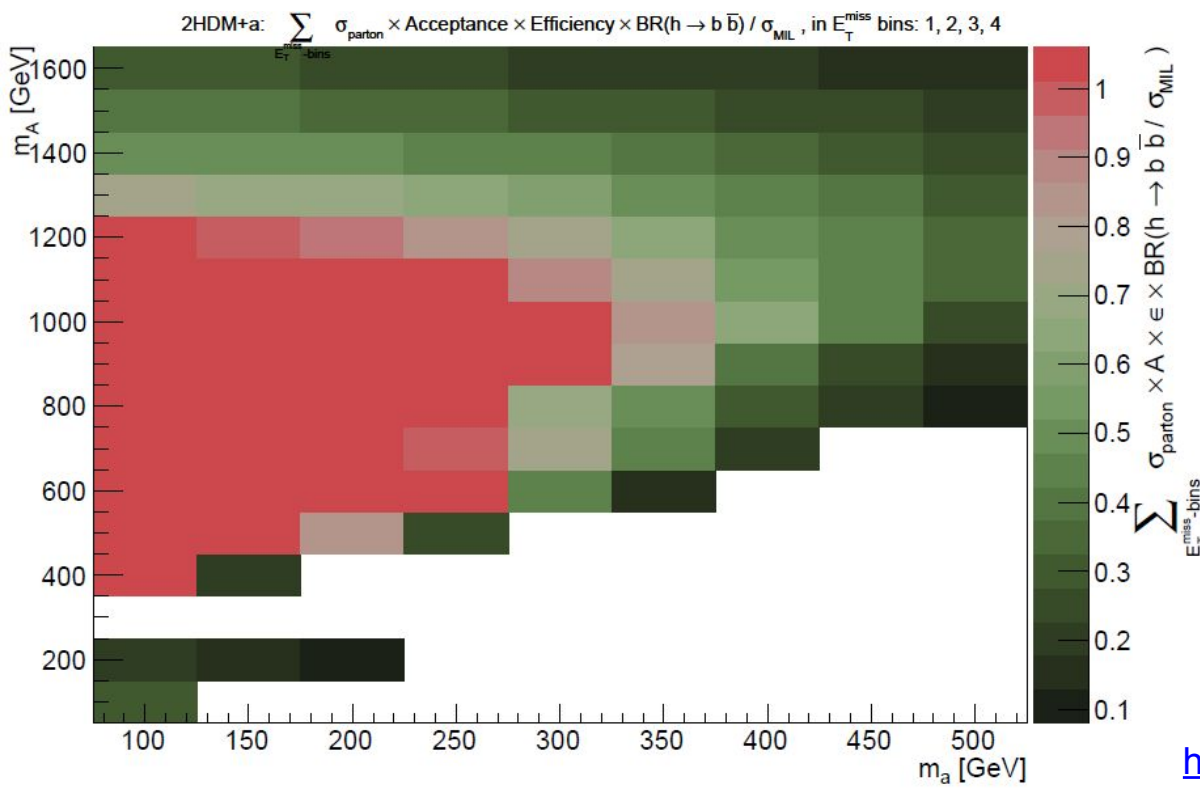

2HDM+a  $m_a=150.0-500.0$   $m_A=1000.0$   $m_H=1000.0$   $\sin(\theta)=0.35$

- $m_a$  and  $m_A$  dominant effect on signal shape
  - $\Rightarrow$  make signal grid a mass grid

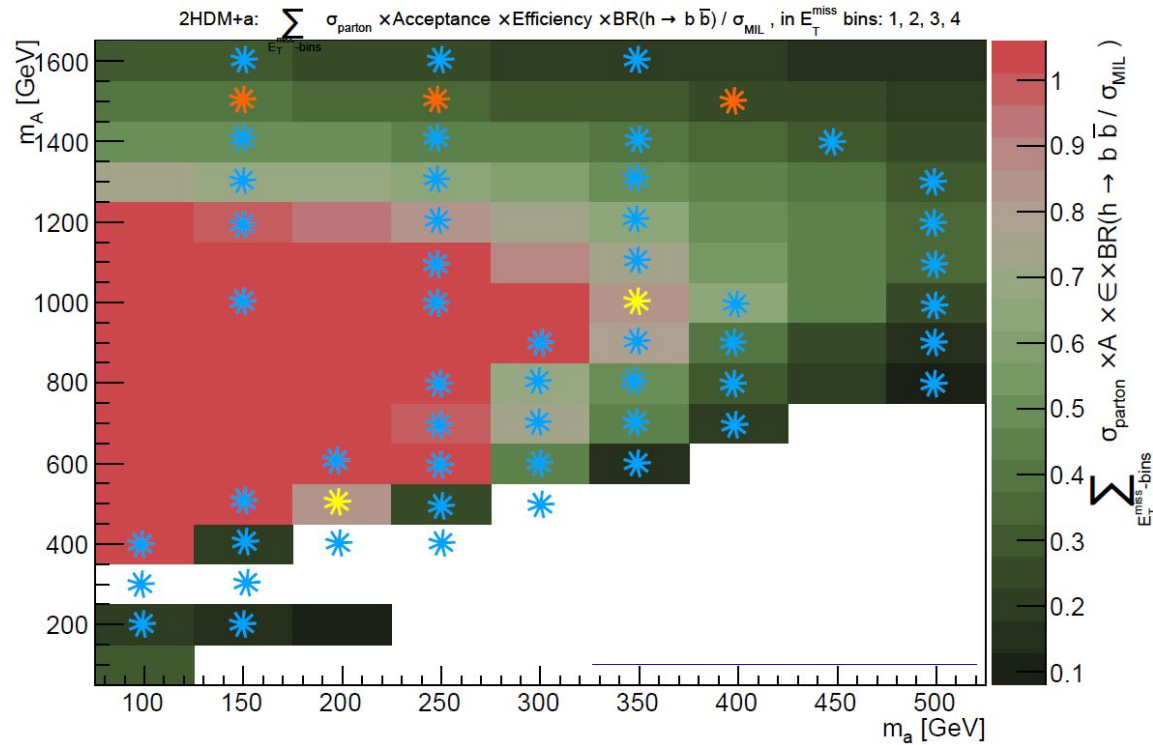

# Estimate mono-h(bb) Signal Sensitivity

1. simulate parton-level x-sec
2. bin into 4 MET bins
3. multiply (bin-by-bin) with Acceptance x Efficiency
4. multiply with SM  $h \rightarrow bb$  branching ratio
5. divide (bin-by-bin) by observed upper limit on  $\sigma(h \rightarrow bb + \text{MET})$
6. sum over 4 MET bins

Range in $E_T^{\text{miss}}/\text{GeV}$	$\sigma_{\text{vis}, h+\text{DM}}^{\text{obs}}$ [fb]	$\sigma_{\text{vis}, h+\text{DM}}^{\text{exp}}$ [fb]	$\mathcal{A} \times \epsilon$ %
[150, 200)	19.1	$18.3^{+7.2}_{-5.1}$	15
[200, 350)	13.1	$10.5^{+4.1}_{-2.9}$	35
[350, 500)	2.4	$1.7^{+0.7}_{-0.5}$	40
[500, $\infty$ )	1.7	$1.8^{+0.7}_{-0.5}$	55

# The mono-h(bb) mass Grid

52 samples

# mono-h(bb) Grid: Parameter Choice

- **parameters of interest:**

- $m_a, m_A$  : scan
- $m_H = m_{H^{\pm}} = m_A$  (  $\Rightarrow$  also scanned )
- $\tan(\beta) = 1$
- $\sin(\theta) = 0.35$
- $\lambda_3 = \lambda_{P1} = \lambda_{P2} = 3$
- $y_X = 1$
- $m_X = 1 \text{ GeV}$

$\Rightarrow$  kinematically diverse set of signals

$\Rightarrow$  complementarity of signatures:

$\rightarrow$  mono-h(bb)

$\rightarrow$  mono-h(yy)

$\rightarrow$  mono-Z(ll)

$\rightarrow$  mono-V(qq)

# mono-h: $\tan(\beta)$

2HDM+a  $m_a=200.0$   $m_A=500.0$   $m_H=500.0$   $\sin(\theta)=0.35$  scan  $\tan(\beta)$

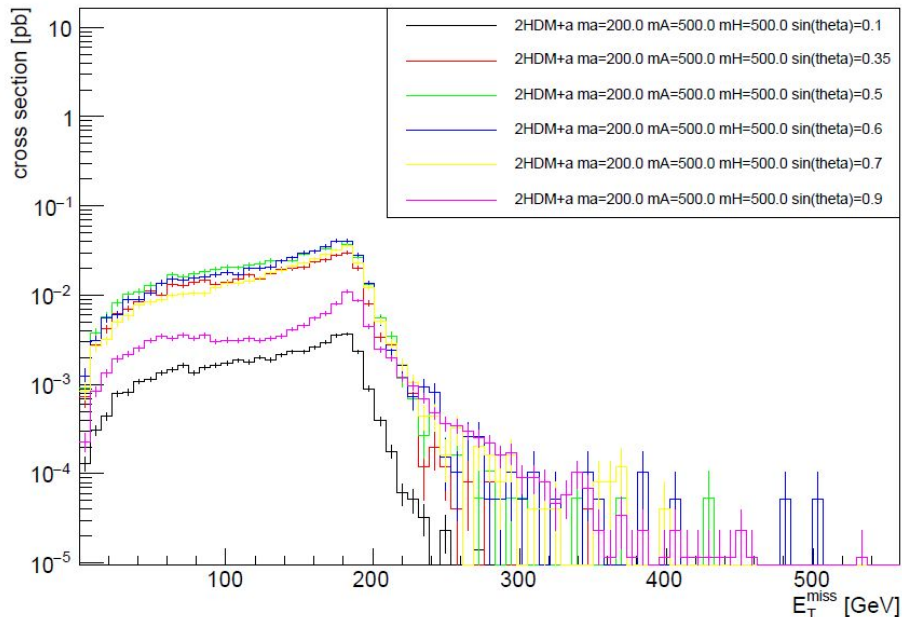

2HDM+a  $m_a=350.0$   $m_A=1000.0$   $m_H=1000.0$   $\sin(\theta)=0.35$  scan  $\tan(\beta)$

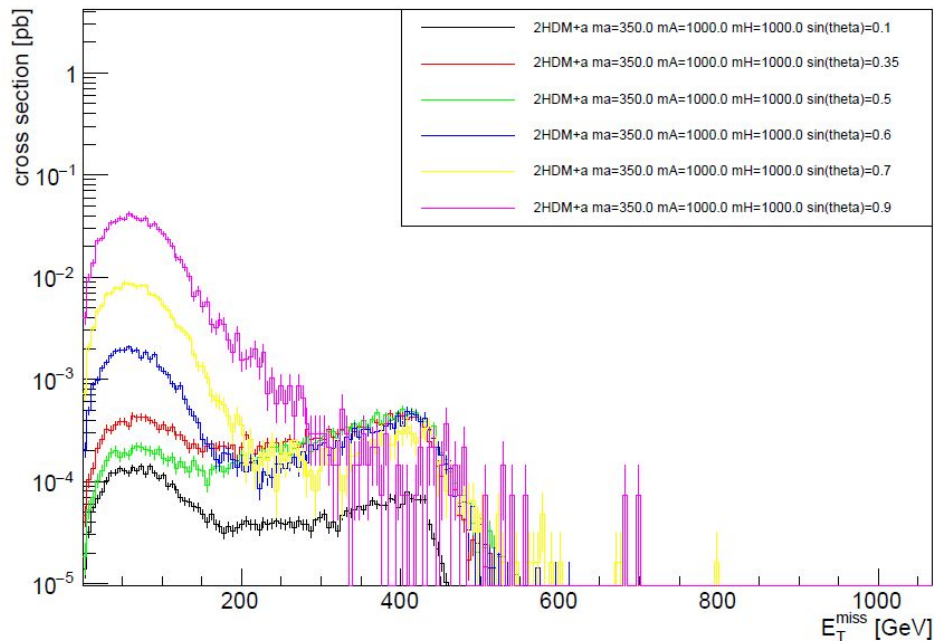

- less strong dependence than  $m_A$ ,  $m_a$
- non-trivial shape dependence

# mono-h: $\sin(\theta)$
